The 50-Mev H/sup -/ injection line for the RCS at Argonne National Laboratory has 16 quadrupole and eight bending magnets. Horizontal and vertical profiles can be obtained at 12 wire scanner positions. Size information from these profiles can be used to determine the three ellipses parameters in each plane required to describe the transverse phase space. Those locations that have dispersion permit the momentum error to be used as a fourth fitting parameter. The assumed accuracy of the size measurements provides an error matrix that predicts the rms errors of the fitted parameters. 3 refs.

57948 Studies of an unneutral electron cloud in the CFIA. Fisher, A.; Gilad, P.; Goldin, F.; Rostoker, N. (Univ of Calif, Irvine). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3383-3385(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

In the Collective Focusing Ion Accelerator (CFIA) scheme, a non-neutral electron cloud is trapped in a multiple mirror toroidal magnetic field. The electrons' radial electrostatic field serves to confine and focus an accelerated ion beam. The ion beam, with a density up to 10% that of the electrons', is accelerated by an induced toroidal electric field. The induced toroidal electric field, however, is not strong enough to overcome the mirror force acting on the electrons. This scheme enables the construction of a very small radius accelerator in the GeV range. As a first stage in the development of the CFIA, it is necessary to demonstrate trapping and stability of a non-neutral electron cloud over a long time (a few msec). It is also necessary to show that the electron cloud remains confined to the mirror cells when an accelerating toroidal electric field is applied. 5 refs.

57949 Infrared measurement of the temperature distribution of a repetitively pulsed electron beam extraction foil as a beam uniformity diagnostic. Buttram, M.T.; Ginn, J.W.; Phipps, G.S. (Sandia Natl Lab, Albuquerque, NM). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3392-3394(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

A presentation is made of experiments to measure the current extracted through the foil of an electron beam diode by observing the heating of the foil. Generally anode current density is measured with a dosimeter film, often of dubious linearity, or with Faraday cups which give a current density versus time map at isolated points or with an array of calorimeters. For the present measurements a fast scanning infrared camera is used to measure the temperature rise of the foil after a pulse. The measurement takes 600/mu/s for a single line scan or 16 ms for a full raster scan. 5 refs.

57950 **Status of the Argonne heavy ion fusion low-beta linac.** Watson, J.M.; Bogaty, J.M.; Moretti, A.; Sacks, R.A.; Sesol, N.Q.; Wright, A.J. (Argonne Natl Lab, Ill). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3449-3451(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

The primary goal of the experimental program in heavy ion fusion (HIF) at Argonne National Laboratory (ANL) during the next few years is to demonstrate many of the requirements of a RF linac driver for inertial fusion power plants. So far, most of the construction effort has been applied to the front end. The ANL program has developed a high intensity xenon source, a 1.5 MV preaccelerator, and the initial cavities of the low-beta linac. The design, initial tests and status of the low-beta linac are described. 8 refs.

57951 **120-GeV superbooster for Fermilab.** Huson, F.R. (Fermilab, Batavia, Ill). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 2046-2048(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

A new superconducting accelerator is proposed which would replace the Fermilab Main Ring as an injector for the Energy Doubler and would be a source of protons for producing antiprotons for the p-bar source. This accelerator would provide 2*10/sup 13/, 120-GeV protons every two and one-half seconds for injection into the Energy Doubler or for antiproton production. The intensity in the Energy Doubler and p-bar production rate would be increased by large factors. Magnets similar to the Energy-Doubler magnets would be used. 4 refs.

57952 **Status report on the rapid cycling synchrotron.** Potts, C.W.; Brumwell, F.R.; Cho, Y.; Rauchas, A.V.; Volk, G.J. (Argonne Natl Lab, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 2104-2106(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

The Rapid Cycling Synchrotron (RCS), originally designed as an injection energy booster for the Zero Gradient Synchrotron (ZGS), operated under constraints imposed by ZGS operation until December 1979. Once these restraints were removed, the RCS made rapid strides toward its near term goals of 8 /mu/A of protons for Argonne National Laboratory's Intense Pulsed Neutron Source program. Reliable 30 Hz operation was achieved in the spring of 1980 with beams as high as 2*10/sup 12/ protons per pulse and weekly average intensities of over 6 /mu/A on target. These gains resulted from better injection matching, more efficient rf turn-on and dynamic chromaticity control. 8 refs.

57953 **Measurements of H/sup o/ and H/sup +/ ion yields during H/sup -/ acceleration in a 50-MeV linac.** Cho, Y.; Madsen, J.; Shin, S.A.; Stipp, V. (Argonne Natl Lab, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 2888-2889(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

Unlike proton linacs where the only particles that can be transported are protons, an H/sup -/ linac can produce H/sup o/ and protons by stripping off one or both electrons of H/sup -/ ions during acceleration. We have measured yields of these ions as a function of linac tank pressures. 1 ref.

57954 **Design and operation water-cooled pyrolytic graphite targets at LAMPF.** Brown, R.D.; Grisham, D.L. (Los Alamos Natl Lab, NM). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 2940-2942(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

Design considerations and actual operating experience are reported for water-cooled pyrolytic graphite targets at the Clinton P. Anderson Meson Physics Facility (LAMPF) at Los Alamos, NM. Emphasis is placed on the use of finite element computer calculations to determine target temperatures and stresses, which can then be evaluated to judge the usefulness of a particular design. Considerations is also given to the swelling of the target following irradiation, and to the measures taken to prolong target lifetime. This work is pertinent to patient treatment. 8 refs.

57955 **Intense pulsed neutron sources.** Kustom, R.L. (Argonne Natl Lab, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3115-3119(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

Accelerator requirements for pulsed spallation neutron sources are stated. Brief descriptions of the Argonne IPNS-I, the Japanese KENS, Los Alamos Scientific Laboratory WNR/PSR, the Rutherford Laboratory SNS, and the West German SNQ facilities are presented. 10 refs.

57956 **Conceptual design for an accelerator system for a very high-intensity pulsed neutron source using a linear induction accelerator.** Foss, M.H. (Argonne Natl Lab, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3181-3183(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

In a synchrotron system, the protons are already bunched, and thus the pulse rate of the neutron beam is that of the repetition rate of the synchrotron. For an accumulator system, the pulse rate is determined by the extraction repetition rate of the accumulator. The author has conceptually designed a new system that uses a linear induction accelerator which can be operated for an average beam current up to a few mA with a repetition rate up to 100 Hz. The details of the design are given. 1 ref.

57957 **Development of superconducting resonators for the Argonne heavy-ion linac.** Shepard, K.W. (Argonne Natl Lab, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3248-3250(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

A method is outlined for conditioning resonators which has produced a significant increase in accelerating gradient and also a design for a split-ring resonator with an optimum particle velocity of 0.16 c. Results of using a 1500 watt rf source to condition superconducting split-ring resonators are described. By repetitively pulsing for a few msec to field levels as high as an 8 MV/m effective accelerating field E/sub a/, electron loading at high field levels has been substantially reduced. The 145.5 MHz resonator is contained in the same 16 inch diameter, 14 inch length housing used for the / beta/?0.1 Argonne split-ring. In design of the split ring element, a 20% reduction in peak surface electric field has been achieved with no significant increase in surface magnetic field. 5 refs.

57958 **Quasi-optimal algorithms for the control loops of the Fermilab energy saver satellite refrigerator.** Martin, M.; Gannon, J.; Rode, C.; McCarthy, J. (Fermilab, Batavia, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3251-3253(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

The Cryogenic System of the Satellite Refrigerator for the Energy Saver Accelerator Ring comprises 12 interrelated closed loops and several open loops. A quasi-optimal algorithm to control the Cryogenic System, under different modes operation, is described. The constraints imposed to define these algorithms and the process followed to characterize the functional parameters are described. A report on the results obtained with the algorithms in a test facility will be presented. 6 refs.

57959 **Fermilab energy saver refrigeration system tests.** Theilacker, J.; Rode, C.; Makara, J.; Richied, D.; Leninger, M.; Ferry, R.; Mizicko, D.; Misek, J. (Fermilab, Batavia, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3257-3259(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

The Energy Saver Refrigeration System is based on the concept of a central helium liquefier (5000 l/hr) providing liquid to 24 satellite refrigerators (966 W at 4.6/degree/K), which operate as amplifiers with a gain of 12. This concept was tested, cooling two 125 m long strings of superconducting magnets. The test was run using one satellite refrigerator operating as the "central liquefier", shipping liquid helium through a 250 m long transfer line to a second satellite refrigerator, which in turn cooled the magnets. In addition to testing the satellite concept, the heat loads of the magnets and transfer line were also measured. 3 refs.

57960 **Correction magnet packages for the energy saver.** Ciazynski, D.; Mantsch, P. (Fermilab, Batavia, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3275-3276(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

The design of the superconducting correction coil system for the Energy Saver has been finalized and production is underway. The requirements of low current (50A) and concentric placement of multipole elements posed difficult and unique design problems. 2 refs.

57961 **Energy saver/doubler quench protection monitor system.** Flora, R.; Saarivirta, J.; Tool, G.; Voy, D. (Fermilab, Batavia, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3289-3291(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

The microprocessor based system to detect quenches in the superconducting magnets is described. Tests conducted over the past two years using a string of twenty superconducting magnets have yielded results having major impact on the design of this system. A network of twenty-four 16-bit microprocessors will monitor the integrated voltage across magnet protection units every 60 Hz line period using isolated voltage to frequency converters. These measurements are compared with the inductive voltage expected. Under transient conditions, the distributed L-C nature of the magnets delays signal propagation as in a transmission line. To achieve the required sensitivity of resistive voltage detection, the inductive voltage for each magnet cell is calculated using two of the six measured dI/dt signals. 5 refs.

57962 **Multi-level computer simulation of the energy saver cooling provisions.** Barton, H.R. Jr.; Mulholland, G.T.; Nicholls, J.E. (Fermilab, Batavia, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3306-3308(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

Mathematical models have been developed to describe the detailed temperature distributions within Energy Saver cryoloops as a function of static and ramp loads. The Satellite performance as a function of the Central Helium Liquefier flows, is calculated for a single equipment specification set. The performance of the system over a wide range of parameters results in clearly defined optima and detailed far-from-design predictions. The agreeement of experimental test data and the simulation prediction is explored for individual magnets, strings and the Satellite-mode refrigerator. 4 refs.

57963 **Magnetostatic design of 85kg superconducting dipoles.** Snowdon, S.C. (Fermilab, Batavia, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3309-3311(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

Extension of the present Tevatron dipole to 85kg has been considered by R.R. Wilson. An accelerator utilizing such dipoles has been designed as the Pentevac since it would permit 5 TeV protons to circulate within the boundaries of the Fermilab site. This study contains results of magnetic field, force, and mechanical stress calculations for one possible Pentevac dipole. 9 refs.

57964 **Multiple element vapor cooled current leads for the Fermilab energy saver correction elements.** Nicol, T.H. (Fermilab, Batavia, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3317-3319(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

The development of the Energy Saver at Fermilab requires the installation of nearly 500 correction coil packages, each containing three elements operated at a nominal 50A each. This necessitates twelve penetrations from ambient conditions to liquid helium at each quadrupole package. The design and test results of complete package containing all twelve vapor cooled conductors will be discussed in full. 1 ref.

57965 **Spool piece testing facility.** Kuchnir, M.; Walker, R.J.; Fowler, W.B.; Mantsch, P.M. (Fermilab, Batavia, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3325-3326(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

"Spool Piece" is the name given to the modular component of the Energy Saver which contains the correction magnets and several other devices required by the superconductive and cryogenic nature of this synchrotron. Approximately 230 spool pieces will be built to go along with 774 dipoles and 224 quadrupoles. To this date four have been built and the plans for a production rate of five per week are being implemented. 5 refs.

57966 **Energy doubler vacuum devices and controls.** Bartelson, L.; Jostlein, H. (Fermilab, Batavia, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3327-3329(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

The vacuum system consists of three different systems, each with its own particular characteristics and requirements: The cryostat insulating vacuum which is completely separate from the two following systems (2) cold beam tube, vacuum sections in which the beam tube is at cryogenic temperature (3) warm beam tube, vacuum sections in which the beam tube is at room temperature.

57967 **Beam transport issues in high current linear accelerators.** Miller, R.B.; Poukey, J.W.; Epstein, B.G.; Shope, S.L.; Genoni, T.C.; Franz, M.; Godfrey, B.B.; Adler, R.J.; Mondelli, A. (Sandia Natl Lab, Albuquerque, NM). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3343-3345(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

Stable beam transport may be the limiting factor in the development of a new generation of high current linear induction accelerators. Several important beam stability topics, including radial oscillations induced by an accelerating gap, the diocotron, resistive wall, and cyclotron maser instabilities, and the transverse beam breakup and image displacement instabilities. At present image displacement appears to represent the most serious limitation to high current beam transport in linear accelerator structures. 13 refs.

57968 **Annual report 1980.** *Annual Report - European Organization for Nuclear Research;* 3-213(1981).

During 1980 the value and importance of CERN's tasks in Europe continued to be fully recognized by the Member States and despite budget difficulties it was possible to carry out fully the current programmes of the Laboratory. Although the SPS was planned to operate only for the first half of the year, its physics programme was pushed ahead with great vigour, as well as those at the ISR, PS and SC. Further important results emerged at the ISR on the production of direct photons, improving our understanding of the parton subprocesses involving gluons. For the first time, beams of alpha particles were stored in the ISR, and the alpha-proton and alpha-alpha collisions were studied at high energy. Several experiments at the ISR and SPS gave evidence on the production of charmed particles, and on their decay processes. The neutrino and muon experimental programmes have brought a wealth of new information. Experiments on the interactions of hadrons, at both high and low transverse momenta, have also progressed, those at low transverse momenta showing striking similarities with interactions produced by neutrinos. Amongst the experiments performed in the lower energy range covered by the PS, one may perhaps single out the demonstration of beam channelling by bent crystals. The SC continued the fruitful ISOLDE programme, a diversity of experiments based on muon spin rotation, and initiated the exploration of a new range of phenomena produced by intense beams of accelerated ^{12}C.

57969 **Modulator charging system upgrade for a 5-MeV electron acceleration.** Rogers, D. Jr.; Dexter, W.; Myers, A.; Reginato, L.L.; Zimmerman, A. (Lawrence Livermore Lab., CA). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Electron Devices;* **ED-26**: No. 10, 1509-1511(Oct 1979). Contract W-7405-ENG-48.

The Lawrence Livermore Laboratory is currently constructing a new linear induction accelerator with a higher beam current than the Astron accelerator. The new accelerator, called the Experimental Test Accelerator (ETA), will be a 5-MeV, 10-kA accelerator with a pulsewidth of 50 ns. Like the Astron, the principle of magnetic induction is used to obtain a linear accelerator. The modular accelerating cavities form essentially a 1:1 transformer and the change in flux in the ferrite core induces an axial electric field for the acceleration of electrons. Since the total energy storage for the ETA is much greater than the requirement for Astron, the power system, the capacitor bank, and the modulator charging system all had to be modified to provide an overall regulation of 0.1 percent. This strict regulation of the charging voltage is necessary for pulse-to-pulse repeatability.

57970 **High intensity beam profile monitors for the LAMPF primary beam lines.** Hoffman, E.W.; Macek, R.J.; van Dyck, O.; Lee, D.; Harvey, A.; Bridge, J.; Caine, J. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-26**: No. 3, 3420-3422(Jun 1979).

Two types of beam profile monitors are in use at LAMPF to measure the properties of the 800 MeV, 500 μA proton beam external to the linac. Both types use secondary electron emission from a wire to produce a current signal proportional to the amount of proton beam that intercepts the wire. The wire scanner system uses a pair of orthogonal wires which are passed through the beam and the harp system uses two fixed planes of parallel wires. Most of the harps are not retractable and are exposed continuously to the primary beam. The high beam intensities available lead to a number of technical problems for instruments that intercept the beam or are close to primary beam targets. The thermal, electrical, radiation-damage, and material selection problems encountered, and some solutions which have been implemented are discussed.

57971 **Pulsed power supply for injection bump magnets.** Praeg, W.F. (Argonne National Lab., IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Industrial Electronics and Control Instrumentation;* **IECI-26**: No. 1, 40-46(Feb 1979).

A controlled resonant circuit charges an energy-storage capacitor bank with a precision of +- 0.1% from an unregulated +- 2% dc source. The capacitor bank energizes an efficient thyristor-controlled pulse-forming discharge circuit. These circuits, which generate magnet pulses of 300 J at a rate of 30/s, are analyzed in this paper.

57972 **QUARTZ - A numerical simulation of an asymmetric electrostatic accelerator.** Wooten, J.W.; Drooks, L.J.; McCollough, D.H.; McGaffey, R.W.; Whealton, J.H. (Oak Ridge National Laboratory, Oak Ridge, Tenn.). pp 368-373 of Advances in computer methods for partial differential equations. III. Proceedings of the third international symposium, Bethlehem, PA, June 20-22, 1979. New Brunswick, NJ; International Association for Mathematics and Computers in Simulation (1979). Contract W-7405-ENG-26.

From 3. IMACS international symposium on computer methods for partial differential equation; Bethlehem, PA, USA (20 Jun 1979).

The QUARTZ computer code has been developed for modeling neutral beam injectors, including steering effects produced by offsetting one or more accelerating electrodes. The features of the code are (1) use of a finite element code to obtain solutions of Poisson's equation in an asymmetric, three-dimensional volume, (2) inclusion of space charge neutralization by electrons, and (3) inclusion of ion space charge through an iterative procedure. The physics of the problem, numerical techniques, and preliminary results are discussed.

57973 **Free electron laser experiment at the nsls 700 mev electron storage ring.** Blewett, J.P.; Blumberg, L.; Campillo, A.J.; DiNardo, R.P.; Hsieh, H.C.; Krinsky, S.; Luccio, A.; Pellegrini, C.; Schuchman, J.; Takacs, P.Z.; van Steenbergen, A. (Brookhaven Natl Lab, Upton, NY). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 3166-3168(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

A free electron laser experiment is described, to be performed with the 700 Mev electron storage ring of the National Synchrotron Light Source. The experiment is designed to study the parameters of the FEL in an electron storage ring and the performance of this laser as a source of short wavelength radiation in the VUV region of the spectrum. The initial experiment will be carried out at a wave length of approximately 3000 A, utilizing a permanent magnet undulator. For an average electron current of 1A distributed in three beam bunches, the small signal gain per pass (relative enhancement of the radiation intensity per electron bunch pass through the undulator) is calculated to be approximately 10%. 13 refs.

57974 **Design of muon storage rings for neutrino oscillations experiments.** Neuffer, D. (Fermilab, Batavia, IL). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 2034-2036(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

A muon storage ring can provide electron and muon neutrino beams of precisely knowable flux which are excellent probes for /upsilon/ oscillations. Constraints on storage ring and injection design are described. Sample muon storage rings are presented and compared with parasitic use of the Fermilab p precooler as a /mu/ storage ring. "Stochastic injection" with injected pion beam decaying to circulating muon beam is favored. A practical possibility may be a low-energy (1 Gev) ring matched to a medium energy proton injector (8 Gev Booster). 7 refs.

57975 (AD-A—108774/1) Radiation and temperature tests of cadmium telluride detectors. Research and development technical report Oct 80-Oct 81. Johnson, O.E. (Army Electronics Research and Development Command, Fort Monmouth, NJ (USA). Combat Surviellance/Target Acq. Lab.). Nov 1981. 36p. (DELCS-TR—81-3). NTIS, PC A03/MF A01.

This report describes the testing of CdTe sensors together with front end electronics is described. These new solid state sensors show promise, in terms of miniature size and sensitivity, toward the development goal of wrist-watch-sized military radiac. The unit was to operate from .01 mR/h to 1,000,000 mR/h using the least of number of sensors.

57976 (AD-A—110462/9) Studies of an optical fiber LiF dosimeter. Final report. (Harshaw Chemical Co., Solon, OH (USA)). Oct 1980. 14p. NTIS, PC A02/MF A01.

A workable system for using the absorption bands of LiF in a dosimetry system has been shown to be feasible. Small extended fibers which readily pass ultraviolet light have not yet been produced. While some additional effort in that direction would seem to be justified, an F band system based on optically clear single crystal material would seem to provide the best chance of succeeding at this moment.

57977 (DPSPU—81-30-14) Gamma monitor for assay of radioactive solid-waste shipments. Crawford, J.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). Jun 1982. Contract AC09-76SR00001. 10p. (CONF-820655—8). NTIS, PC A02/MF A01. Order Number DE82020095.

From Health Physics Society annual meeting; Las Vegas, NV, USA (27 Jun 1982).

A gamma waste monitor has been developed and evaluated at the Savannah River Plant (SRP). The purpose of the monitor is to improve estimates of the radionuclides in solid wastes arriving at the plant's burial ground. This monitor, a computer-based spectrometer, quantitatively measures many radionuclides in SRP waste, including waste in heavily shielded shipping casks. Radionuclides emitting gamma rays of sufficient energy to penetrate the shipping container walls can be measured directly. Other radionuclides that are beta emitters or which emit gamma photons too weak to penetrate the walls of the waste containers can often be estimated by their association with measurable gamma photons. Development of the monitor was initiated to find a more accurate method of estimating the quantities of radioactive materials accumulated in the burial ground and to ensure compliance with burial limits imposed by SRP technical standards. Another benefit from the monitor is that it provides specific radionuclide data which are essential to environmental impact evaluations and decommissioning planning. The gamma waste monitor is described. (WHK)

57978 (EFI—483(26)-81) Calculation of the effect of the radiator thickness and angular collimation on the bremsstrahlung γ-quanta spectrum with Monte-Carlo method. Margaryan, A.T. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 19p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702303.

By means of the Monte Carlo method calculation of spectrum of bremsstrahlung γ quanta, produced at electron radiator interaction is carried out. The effect of the radiator thickness angular collimation as well as radiator γ-quanta absorption are taken into account. Moliere and Schiff accurable distributions have been used. Calculations corresponding to the electron passage with initial energy $E=3$ GeV through the lead radiators of 0.005, 0.01, 0.05, 0.1 and 0.2 thickness where X_0 is radiation length are given. Operation factor values in different energy and angular intervals are shown.

57979 (EGG-SHS—5934) Quantitative relations between beta-gamma mixed-field dosimeter responses and dose-equivalent conversion factors according to the testing standard. Gupta, V.P. (Idaho National Engineering Lab., Idaho Falls (USA)). Aug 1982. Contract AC07-76ID01570. 24p. NTIS, PC A02/MF A01. Order Number DE82018819.

The conventional two-element personnel dosimeters, usually having two thick TLD (thermoluminescent dosimetry) ribbons, are used extensively for radiation protection dosimetry. Many of these dosimeters are used for the measurement of beta and gamma radiation doses received in mixed beta-gamma fields. Severe limitations exist, however, on the relative magnitudes and energies of these fields that may be measured simultaneously. Moreover, due to a well-known energy dependence of these dosimeters, particularly for the beta-radiations, systematic errors will occur whenever the differences in workplaces and calibration radiation energies exist. A simple mathematical approach is presented to estimate the deep and shallow dose equivalent values at different energies for such dosimeters. The formulae correlate the dosimeter responses and dose equivalent conversion factors at different energies by taking into account the guidelines of the adopted ANSI Standard N13.11 and the dosimetry practices followed by most dosimeter processors. This standard is to be used in a mandatory testing program in the United States.

57980 (HMI-B—351) Formulae for spectrum fitting. Schmidt, R. (Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.)). Apr 1981. 42p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82904612.

Portions of document are illegible.

The analysis of spectra is an important part of the interpretation of nuclear physics experiments. However, often the spectral peaks cannot be fitted properly by Gaussian (normal distribution) curves or modifications of them. Therefore, a section of the measured spectrum is often selected for use as a reference curve for the purpose of peak fitting. This report presents formulae required in the implementation of this fitting technique.

57981 (INFN/TC—81/12) Status of the acquisition system for the x-ray channel of the Wiggler Adone facility. Cavallo, N. (Istituto Nazionale di Fisica Nucleare, Naples (Italy)). 2 Jul 1981. 11p. (In Italian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82903261.

Portions of document are illegible.

Results are given for the testing of safety and radiation protection systems at the Wiggler Adone synchrotron facility, and a study is made of the characteristics and structure of x-ray beams. Also described are the results of absorption experiments and analyses of threshold and extended x-ray absorption fine structure. Illustrations of hardware, control and acquisition systems are also presented. 4 references, 5 figures.

57982 (INIS-mf—7090) Mathematical model and computer programme for theoretical calculation of calibration curves of neutron soil moisture probes with highly effective counters. Kolev, N.A. (Nauchno-Izsledovatelski Inst. po Pochvoznanie, Sofia (Bulgaria)). Jul 1981. 37p. (In Bulgarian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82780704.

A mathematical model based on the three group theory for theoretical calculation by means of computer of the calibration curves of neutron soil moisture probes with highly effective counters, is described. Methods for experimental correction of the mathematical model are discussed and proposed. The computer programme described allows the calibration of neutron probes with high or low effective counters, and central or end geometry, with or without linearizing of the calibration curve. The use of two calculation variants and printing of output data gives the possibility not only for calibration, but also for other researches. The separate data inputs for soil and probe temperature allow the temperature influence analysis. The computer programme and calculation examples are given. (author).

57983 (INIS-mf—7116, pp vp) **Two-crystal compton polarimeter for nuclear structure measurements in ^{53}Cr and ^{55}Fe.** Byrne, A.P.; Poletti, A.R. (Auckland Univ. (New Zealand). Dept. of Physics). 1982. Dep. NTIS (US Sales Only).

From 9. AINSE nuclear physics conference; Melbourne, Australia (8 Feb 1982).

57984 (INIS-mf—7116, pp vp) **Position sensitive x-ray detector for angular distribution measurements.** Pender, L.F. (Australian National Univ., Canberra. Dept. of Nuclear Physics). 1982. Dep. NTIS (US Sales Only).

From 9. AINSE nuclear physics conference; Melbourne, Australia (8 Feb 1982).

57985 (INIS-mf—7116, pp vp) **Compensation of helical decay lines for use in position sensitive particle detectors.** Officer, V.C. (Melbourne Univ., Parkville (Australia). School of Physics). 1982. Dep. NTIS (US Sales Only).

From 9. AINSE nuclear physics conference; Melbourne, Australia (8 Feb 1982).

57986 **(INIS-SU—103) Nuclear electronics. Issue 11. Theory and design of electronic equipment of physical experiment.** Agakhanyan, T.M. (ed.). (Moskovskij Inzhenerno-Fizicheskij Inst. (USSR)). 1980. 115p. (In Russian). NTIS (US Sales Only), PC A06/MF A01. Order Number DE82780686.

Separate abstracts were prepared for 8 papers in this collection.

57987 **(ITEF—105(1981)) Definition of the measurement accuracy of the microobject spatial coordinates recorded by the focused image holography.** Mel'nichenko, I.A.; Silaev, V.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1981. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702201.

Results of experimental determination of holographic resolution of focused images scheme proposed for a vertex detector developed on the base of a bubble hydrogen chamber are presented. By means of a measuring device model the measurement accuracy of spartial coordinates of reconstructed image of the 100 μm microobjects is determined. The measurement accuracy constitutes 2.5 μm in the object plane and 30 μm in the object depth.

57988 **(JINR—R-3-81-546) Experimental investigation of polarizing mirror neutron guides. Neutron-optical characteristics.** Korneev, D.A.; Pasyuk, V.V.; Rzhany, Kh.; Shchebetov, A.F. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1981. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702712.

Experimental investigation of neutron-optical characteristics of the 5-meter radially curved polarizing neutron guides at the IBR- 30 pulsed reactor (JINR, Dubna) is reported. The transmission function Tsub(exp)(lambda) was measured in the neutron wave length range from 1.0 to 4.0 A at an incident beam collimation of $0.8x10^{-3}$ rad for different angles between the neutron guide and beam axis. Using the calculation program of transmission function Tsub(id)(lambda) for ideal neutron guide, spectral and angular dependences of neutron losses in the neutron guide are determined. The transverse section of the neutron beam which escapes from the neutron guide, as well as spectrum shape with respect to detector transverse position are measured. The difference in neutron spectrum shape is observed depending on detector transverse position. The application of these neutron guides in experiment are discussed in detail.

57989 **(JINR-R—10-81-638) Base software for anti dp-experiment on the CDC-6500 computer.** Dirner, A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1981. 9p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702214.

A base software for data processing obtained from the "LUDMILA" hydrogen liquid chamber exposed in an antideuterium beam (anti dp-experiment) is described. The system consists of the HGEOKIN program for event geometrical reconstruction and kinematical identification and the HEDIT program for event selection and formation of data summary tape. The system is realised on the base of HYDRA module programming system on the CDC-6500 computer.

57990 **(JINR-R—10-81-670) Software for investigations of inclusive reactions in anti pp interactions.** Badalyan, S.G.; Batyunya, B.V.; Govorun, N.N.; Dirner, A.; Ivanov, V.G. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1981. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702215.

In connection with the inclusive reaction studying carried out on the 2 m "Ludmila" hydrogen bubble chamber in the antiproton beam the complex of programs has been created. This complex is intended for solving the following tasks: space reconstruction, combining several reconstuction results in the same event, preparing the data summary tapes. The complex has been realized on the CDC-6500 computer (JINR). It consists of the HYDRA system application programs and is used for writing permanent files on private disk packages. Using these disks for writing and reading the intermediate data provides an effective operation of central processors and minimum time of peripheral processor operation. The program chain considered allows one to handle events of any mulltiplicity with the speed of 500-600 event per hour.

57991 **(SAND—82-1495) Use of nuclear instrument modules (NIM) for lead and arsenic counting systems.** Bonaparte, S.D. (Sandia National Labs., Albuquerque, NM (USA)). Aug 1982. Contract AC04-76DP00789. 11p. NTIS, PC A02/MF A01. Order Number DE82020421.

This paper describes an economical lead counting system for the measurement of DT (14 MeV) neutrons and an arsenic counting system for the measurement of DD neutrons (2.5 MeV). These systems can be readily assembled from commercially-available equipment.

57992 **(ZfK—433(v.2)) Proceedings of the 10. International Symposium on Nuclear Electronics.** Flaemig, E.; Koenig, K.H. (eds.). (Joint Inst. for Nuclear Research, Dubna (USSR); Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic); Technische Univ., Dresden (German Democratic Republic)). Feb 1981. 342p. (CONF-8004215—(Vol.2)). NTIS (US Sales Only), PC A15/MF A01. Order Number DE82702197.

From 10. international symposium nuclear electronics; Dresden, German Democratic Republic (10 Apr 1980).

The report comprises lectures given at the X. International Symposium on Nuclear Electronics. Volume II comprehends essential topics to the development of computerized systems and the application of CAMAC modules and their connection with microprocessors in the field of high energy physics. Volume II is divided in two sections. Section C: measuring electronics in high energy physics. Section D: application of computer aided systems in experiments with special regard to microcomputer and CAMAC system.

57993 (ZfK—433(v.2), pp 24-37) **High rate pulse processing systems for silicon active targets.** Artuso, M.; D'Angelo, P. (Istituto Nazionale di Fisica Nucleare, Milan (Italy)); Gatti, E. (Politecnico di Milano (Italy). Ist. di Fisica); Manfredi, P.F. (Pavia Univ. (Italy)); Marioli, D. (Politecnico di Milano (Italy). Centro Studi Nucleari E. Fermi). Feb 1981. Dep. NTIS (US Sales Only).

From 10. international symposium nuclear electronics; Dresden, German Democratic Republic (10 Apr 1980).

The theoretical part of this paper is focused on the choice of the preamplifier and on the comparison between time-variant and time-invariant pulse processing for this particular set of applications. The points covered by the analysis are: limitations of transformer-coupled preamplifiers, fast cold-resistence charge-sensitive loops and count-rate performances of gated filters and transversal filters. Upon the conclusions of the evaluation analysis a new pulse processing system has been based. It was implemented with the purpose of reaching a count-rate capability of 10^6 pulses per second. The processor consists of a fast preamplifier followed by a triangular shaper delivering a 100ns-wide pulse. The shaper employs a coaxial-cable transversal filter. The complete system which serves 30 silicon detectors is described, and its performances in terms of energy resolution, counting rate capabilities and stability are given.

57994 (ZfK—433(v.2), pp 61-72) **Line track detection with fast bit-slice microprocessors.** Stuckenberg, H.J. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Feb 1981. (In German). Dep. NTIS (US Sales Only).

From 10. international symposium nuclear electronics; Dresden, German Democratic Republic (10 Apr 1980).

A bit-slice microprocessor is described which renders possible to calculate the track-coordinates of selected events. The microprocessor is constructed with fast hardware and software. The hardware is described in detail and the problems of the software are discussed. The results of the calculation of the track coordinats as well as the radius and the tangent of the track are figured. They demonstrate that the microprocessor works effectively as an event filter.

57995 **(ZfK—461) Position-sensitive ionization chamber for a time-of-flight spectrometer.** Manfrass, P.; Schilling, K.D.; Seidel, W.; Sodan, F.; Stary, F. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Nov 1981. 11p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702198.

The construction and working principles of a position sensitive ionization chamber are described, which is used for the time-of-flight spectrometer DEMAS. The whole set-up gives information on the energy, the time-of-flight and the coordinates of a detected HI-reaction product. Also the differential energy lost for Z-identification can be determined. The results for each parameter are given.

57996 **(ZfK—464) Electronical set-up and on-line data processing for the determination of the cross section of the reaction ^{1}H(n,d)γ.** Hutsch, J.; Moesner, J.; Schmidt, G.; Stiehler, T.; Kudin, L.G.; Spiridenkov, E.M.; Volkov, S.S. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Jan 1982. 9p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702199.

After a brief description of the physical problem the electronical set-up for the investigation of the reaction ^{1}H(n,d)γ at Esub(n) = 25 MeV and the connection with the on-line computer are described in the first part of the present work. The second part includes the software and the data handling.

57997 **(ZJE—235) Activation method for determining neutron spectra and fluences.** Hogel, J.; Vespalec, R. (Skoda, Plzen (Czechoslovakia). Zavod Vystavba Jadernych Elektraren). 1980. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702200.

3 mm thick foils of 4 and 17 mm in diameter were used for measurements. NaI scintillation detectors 45 mm in diameter by 50 mm thick and 40 mm in diameter by 1 mm thick, and a Ge-Li spectrometer of 53 cm^3 in volume were used for gamma detection. A photopeak or a certain part of the integral spectrum was measured for each radionuclide. Computer code PIKAR was applied in automatic calculation of a simple gamma spectrum obtained using the semiconductor spectrometer. The FACT code was used for calculating foil activity. Codes SAND II and RFSP were used for neutron spectra unfolding. Ge-Li detector spectrometry was used for determining neutron fluence. Code FLUE was used for determining the mean value of neutron flux density and fluence.

57998 **Automatic readout micrometer.** Lauritzen, T. (to Department of Energy). US Patent 4,320,577. 23 Mar 1982. Filed date 4 Aug 1979. vp. PAT-APPL-045170.

A measuring system is disclosed for surveying and very accurately positioning objects with respect to a reference line. A principal use of this surveying system is for accurately aligning the electromagnets which direct a particle beam emitted from a particle accelerator. Prior art surveying systems require highly skilled surveyors. Prior art systems include, for example, optical surveying systems which are susceptible to operator reading errors, and celestial navigation-type surveying systems, with their inherent complexities. The present invention provides an automatic readout micrometer which can very accurately measure distances. The invention has a simplicity of operation which practically eliminates the possibilities of operator optical reading error, owning to the elimination of traditional optical alignments for making measurements. The invention has an extendable arm which carries a laser surveying target. The extendable arm can be continuously positioned over its entire length of travel by either a coarse or fine adjustment without having the fine adjustment outrun the coarse adjustment until a reference laser beam is centered on the target as indicated by a digital readout. The length of the micrometer can then be accurately and automatically read by a computer and compared with a standardized set of alignment measurements. Due to its construction, the micrometer eliminates any errors due to temperature changes when the system is operated within a standard operating temperature range.

57999 **Spin precession resonance spectrometer.** Felcher, G.P.; Carpenter, J.M. (Argonne National Lab., IL (USA)). *Nuclear Instruments and Methods in Physics Research;* **192**: No. 2/3, 513-522(1 Feb 1982).

We present the concept of a new neutron scattering instrument to be used at a pulsed neutron source. The machine, which starts as a development of the resonance detector spectrometer and incorporates the basic ideas of spin precession energy analysis, is suited for the study of medium- and high-energy excitations in solids and liquids, particularly at small momentum transfers. The most novel characteristic of its performance is a high resolving power, achieved without appreciable loss of neutron flux. In an alternative operation (and sacrificing resolution) the instrument is capable of separating spin-dependent from spin-independent scattering processes.

58000 **Thermal neutron coincidence counting system.** Erkkila, B.H.; Marshall, R.S. (Los Alamos Sci Lab, NM). *Nuclear Technology;* **50**: No. 3, 307-313(Oct 1980).

The thermal neutron coincidence counter (TNC) is one of a variety of instruments used in the Plutonium Processing Facility at the Los Alamos Scientific Laboratory (LASL) for nondestructive assay (NDA) of spontaneously fissioning material, such as plutonium in powder, scrap, and metal. 2 refs.

4402 Radiation Effects On Instrument Components, Instruments, Or Electronic Systems

REFER ALSO TO CITATION(S) 56730, 57472, 58632

58001 **(AD-A—109691/6) Hardness assurance latchup test procedure. Final report, 25 April 1977-28 August 1978.** Witteles, A.A. (TRW Defense and Space Systems Group, Redondo Beach, CA (USA)). 28 Aug 1978. 21p. NTIS, PC A02/MF A01.

This test procedure defines the detailed requirements for gamma dose rate testing of semiconductor integrated circuits to determine if they are susceptible to radiation-induced latchup. This test is not deleterious, and devices which have been subjected to and passed the test may be used as production hardware. There are two types of radiation-induced latchup: (1) a hard latchup, and (2) an incipient latchup. A hard latchup is a sustained functional failure. The erroneous operational condition can be stopped by cycling bias power if burnout has not occurred in the interim. Incipient latchup is characterized by a functional failure which is not sustained, but which lasts longer than can be explained by normal circuit time constants. Identification of a latchup-susceptible IC is accomplished by identifying erroneous operating states immediately after radiation exposure by exercising the device with a functional test.

58002 **(AD-A—109700/5) Radiation effects on transmission in optical fiber systems. Final report 1980-1981.** Hilarides, W.H. (Naval Academy, Annapolis, MD). 2 Jun 1981. 51p. (USNA-TSPR—110). NTIS, PC A04/MF A01.

A study was done of the effects of 14.7 MeV neutrons on transmission in optical fibers. This study was done with monochromatic light in the spectral range from 700 to 1700 nanometers. Of the fibers studied, two were high purity silica fibers, and two were Germanium doped core silica fibers. An important result of the study was that the radiation induced damage was wavelength related. The induced damage decreased rapidly as the wavelength increased from 800 to 1100 nanometers, with minimal damage noted above 1300 nanometers. This trend was due primarily to the energy levels of traps formed as the bombarding neutrons broke bonds within the silica. Several other interesting trends were noted. First, the water content of the fiber affected the amount of induced damage. Second, the method by which the fiber was made affected the damage levels. Third, the dopant used affected the damage levels. These trends deserved further study, but because the data base was so small, more specific conclusions were not possible.

58003 **(AD-A—110263/1) Essential pattern and sequence sensitivity in semiconductor memories.** Tuszynski, A. (Minnesota Univ., Minneapolis (USA). Dept. of Electrical Engineering). 15 Jul 1980. 101p. NTIS, PC A06/MF A01.

Pragmatic classification of errors linked to a study of Essential Pattern and Sequence Sensitivity leads to a new and credible strategy for the validation of individual chips and entire memories. Three categories or errors are recognized: hard, non-random soft and random soft errors. Progress in the verification of VLSI devices is predicated on the availability of diagnostic instrumentation. Three promising techniques are being developed: (1) Stroboscopic Scanning Electron Microscopy; (2) the Zero-Capacitance Probe; and (3) Pseudo Analog Testing. More attention must also be given to the matter of process statistics. Lastly, much remains to be done at the system level. We consider error correction of the Hamming-code variety as a particularly efficient technique of fault-tolerant design and we discuss chip and system architectures for reduction of the risk of burst errors. All in all we advocate (1) conventional testing for hard errors attributable typically to stuck-at-faults, (2) extensive analysis and diagnostics for non-random soft errors produced more often than not by crosstalk manifested as Pattern or Sequence Sensitivity, and (3) block-oriented error correction for random errors induced most often by alpha particles and cosmic rays.

58004 **(AD-A—111047/7) Radiation effects in pigtailed GaAs and GaAlAs LEDs. Final report, 12 Feb 79-30 Sep 80.** Barnes, C.E. (Sandia Labs., Albuquerque, NM (USA)). Jun 1981. Contract AC04-76DP00789. 115p. (SAND—81-0929). NTIS, PC A06/MF A01.

Permanent and transient radiation effects have been studied in Plessey pigtailed, high radiance GaAs and GaAlAs LEDs using neutron, gamma ray and X-ray sources. The radiation-induced source of degradation in these devices was determined by also examining both bare, unpigtailed LEDs and separate samples of the Corning fibers used as pigtails. No transient effects were observed in the unpigtailed LEDs during either pulsed neutron or X-ray exposure. In contrast, the Corning doped silica fibers exhibited strong transient attenuation following pulsed X-ray bombardment. Permanent neutron damage in these pigtailed LEDs consisted essentially of light output degradation in the LED itself. While this effect was significant, it is important to note that these LEDs have exceptionally good neutron tolerance in that their average light output degrades by only a factor of 1.7 at fluences near 1 x 10(to the 14th power)n/sq cm. Permanent gamma ray effects due to a Co-60 irradiation of 1 megared were restricted to a small increase in attenuation in the fiber. The two primary radiation effects were then transient attenuation in the fiber pigtail and permanent neutron-induced degradation of the LED.

58005 **(SAND—81-2140) Soft-error susceptibility of a CMOS RAM: dependence upon power-supply voltage.** Kolasinski, W.A.; Koga, R.; Blake, J.B.; Diehl, S.E. (Sandia National Labs., Albuquerque, NM (USA); Aerospace Corp., Los Angeles, CA (USA). Space Sciences Lab.; Auburn Univ., AL (USA). Dept. of Electrical Engineering). May 1982. Contract AC04-76DP00789. 9p. NTIS, PC A02/MF A01. Order Number DE82015654.

Two types of delidded CMOS 1024 x 1 RAM (Harris HM 6508-RH and Sandia TA597) have been tested for susceptibility to soft bit errors caused by 150-MeV krypton ions. Bit-error susceptibility was measured as a function of bias voltage and exposure angle with respect to the chip normal. Comparison of measured bit-error rates and thresholds with those computed by use of a simple device model and manufacturer-supplied data shows good agreement in some respects while raising questions in others. In the case of the HM6508-RH RAMs, measured values of critical charge of 1 pC and 2 pC at 5V and 7V, respectively, indicate that the devices can be expected to show bit-error rates in space of approximately 1 x 10^{-5} per chip per day at 7V bias.

4403 Miscellaneous Instruments

REFER ALSO TO CITATION(S) 56473, 56612, 56716, 56751, 56833, 56836, 57370, 57380, 57504, 57556, 58048, 58069, 58595

58006 **(BDX—613-2658R) Quadrature-error-correction techniques for the HP8542A ANA.** Taylor, J.L. (Bendix Corp., Kansas City, MO (USA)). 1981. Contract AC04-76DP00613. 14p. (CONF-810793—1). NTIS, PC A02/MF A01. Order Number DE82015427.

From Workshop on automatic radio frequency measurements; Los Angeles, CA, USA (1 Jul 1981).

Quadrature error may be defined as the deviation from linearity of the detected magnitude and phase of the input signals in an automatic network analyzer. Quadrature error affects normal automatic network analyzer calibration parameters. Direct measurement of quadrature error involves measurement of the test channel amplitude and the test channel phase at the input to the attenuators controlling the signal amplitude to the quadrature detector. These measurements are then compared to the digitized components. A far less laborious indirect measurement method involves using the automatic network analyzer in a normal operating mode after normal calibration and making measurements of a precision air line. The measured data are then evaluated for deviations from linearity as a function of the measured phase. This method adds some error due to inaccuracy in calibration, but its effects may be reduced. Once the quadrature error is known, a Fourier series curve fit may be used to correct for it. (LEW)

58007 **(BDX—613-2787) RF characterization of semiconductors. Final report.** Thomas, A.G. (Bendix Corp., Kansas City, MO (USA)). Jun 1982. Contract AC04-76DP00613. 44p. NTIS, PC A03/MF A01. Order Number DE82016995.

A capability to perform RF characterization and a program for providing RF performance assurance for semiconductor devices were developed to support new advanced weapon systems with all solid-state radars. This report summarizes the activities performed at Bendix Kansas City since 1972 and the conclusions formulated on the characterization of various categories of bipolar microwave devices.

58008 **(DPSPU—81-30-9) Automated mass-spectrometer system for measuring uranium and plutonium process streams.** Boyce, W.B.; Goergen, C.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 1981. Contract AC09-76SR00001. 10p. (CONF-811025—26). NTIS, PC A02/MF A01. Order Number DE82020068.

From 25. conference on analytical chemistry and nuclear technology; Gatlinburg, TN, USA (6 Oct 1981).

A Varian Mat 260 Automated Thermal Ionization Mass Spectrometer System was purchased by the Savannah River Plant (SRP) and recently installed by Varian Factory representatives to meet the requirements of the SRP Safeguards program. This instrument features many new innovations in mass spectrometers. The most novel is a 23 cm radius magnetic sector that provides the same dispersion as a 46 cm radius sector by using off-axis ion beam entry and exit to the magnetic field. Up to 13 samples may be loaded at one time because the source housing is designed to receive a carrousel holding up to 13 dual filament assemblies. The dual Faraday Cup collector system is designed to measure simultaneously two uranium or plutonium masses, three mass units apart. A Hewlett Packard 9825-A calculator and a Varian developed software package controls filament heatup cycles, sample preconditioning, ion beam focusing, carrousel rotation and mass selection. The calculator also performs data acquisition services with a hard copy printout. A glove box train provides containment for radioactive sample preparation and filament plating. It also provides the necessary containment for the mass spectrometer ion source and a separate preconditioner without having to remove the loaded sample carrousel from the glove box train.

58009 (EFI—488(31)-81) Statistics of electron multiplication in microchannel plates. Akhperdzhanyan, A.G.; Margaryan, Yu.L. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701857.

Kinetic equations for the probabilities of different values of the multiplication coefficient for microchannel plates are set up and solved. The fluctuations of the multiplication coefficient are shown to obey the Polya statistics in the model under consideration.

58010 (LA-UR—82-1425) Metallograph for the examination of low-level radioactive samples. Cook, J.H.; Shaffer, D.S.; Petty, W.F. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 5p. (CONF-820609—31). NTIS, PC A02/MF A01. Order Number DE82015729.

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

A new remote-controlled metallograph was built for use in a low-level radiation background. The metallograph is low cost compared to a conventional remote-controlled metallograph. The motors that drive the stage motions and focus are commercially available and attach to the metallograph without modification. The metallograph was installed on a drawer in a blister behind a shielding door. This allows the metallograph to be reached quickly and easily for maintenance and repair.

58011 (NUREG/CR—2264) Characterization methods for ultrasonic test systems. Busse, L.J.; Becker, F.L.; Bowey, R.E.; Doctor, S.R.; Gribble, R.P.; Posakony, G.J. (Pacific Northwest Lab., Richland, WA (USA)). Jul 1982. Contract AC06-76RL01830. 55p. (PNL—4215). NTIS, PC A04/MF A01 - GPO $5.00.

Methods for the characterization of ultrasonic transducers (search units) and instruments are presented. The instrument system is considered as three separate components consisting of a transducer, a receiver-display, and a pulser. The operation of each component is assessed independently. The methods presented were chosen because they provide the greatest amount of information about component operation and were not chosen based upon such conditions as cost, ease of operation, field implementation, etc. The results of evaluating a number of commercially available ultrasonic test instruments are presented.

58012 (PTB-E—19) Wide-band E/H field sensing probes: A discussion of probe interactions and coupling problems. Lindsay, J.E. Jr. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Elektrizitaet). Oct 1981. 78p. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

This report will discuss a variety of problems encountered in the development of a wide-band E-and H field probe. This probe is to cover the frequency range of a few tenths of a megahertz to approximately 10 MHz. Time harmonic (i.e., sinusoidally varying) fields are to be measured; the E-and H field ellipses are to be determined and also the resulting Poynting vector.

58013 (UUIP—1052) Electron spectroscopy for atoms, molecules and condensed matter. Siegbahn, K. (Uppsala Univ. (Sweden). Fysiska Institutionen). Dec 1981. 58p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE82702497.

A review is given of the research performed at the Institute of Physics, Uppsala under the direction of Prof. Siegbahn. in the field of electron spectroscopy applied to solids, liquids and gases. The developemnt of the spectroscopic methods is the central theme of the review.

58014 Self-heated thermocouples for far-infrared detection. Neikirk, D.P.; Rutledge, D.B. (Division of Engineering and Applied Science, California Institute of Technology, Pasadena, California 91125). *Applied Physics Letters;* **41**: No. 5, 400-402(1 Sep 1982). Contract AM03-76SF00010.

A novel self-heated Bi-Sb thermocouple for far-infrared detection has been developed. The detector is suitable for integration with monolithic antennas and imaging arrays. The device is fabricated in a single photolithography masking step using a photoresist-bridge technique. This bridge technique has also been used to make microbolometers with lower 1/f noise than those made by two conventional masking steps. The thermocouples have a noise equivalent power (NEP) of 7×10^{-10} W/($\sqrt{}$Hz) and a 3-dB frequency response of 150 kHz.

58015 Direct detection of vacuum ultraviolet scintillations in liquid helium using germanium photodiodes. Luke, P.N.; Steiner, H.M.; Haller, E.E. (Lawrence Berkeley Laboratory and University of California, Berkeley, California 94720). *Applied Physics Letters;* **41**: No. 4, 315-317(15 Aug 1982). Contract AC03-76SF00098.

Direct detection of vacuum ultraviolet scintillations in liquid helium produced by 5.3 MeV α particles has been accomplished using a high-purity germanium photodiode. The diode was immersed in the liquid helium and operated in the side-entry mode with a senstive area of 0.3×1.0 cm. Scintillation from each α particle was detected as a single pulse. A signal rise time <0.1 μs was obtained at an electric field $>$ or ≈ 1200 V cm^{-1}. The quantum efficiency of the photodiode was estimated to be ~ 4.

58016 Broadband triboluminescence in silica core fiber optic waveguides. Smiel, A.J.; Fischer, T.A. (Electro-Optics Division, 2152, Sandia National Laboratories, Albuquerque, New Mexico 87185). *Applied Physics Letters;* **41**: No. 4, 324-326(15 Aug 1982). Contract AC04-76DP00789.

This letter describes the first observation of broadband, shock-induced luminescence in silica core fiber optic waveguides on a single-event basis. Spectra recorded with an optical multichannel analyzer suggest that at least two different types of luminescence centers are responsible for this emission. The degree to which each type of luminescence center is created and/or excited is found to depend upon the detailed dynamics of the crushing.

58017 Imaging antenna array at 119 μm. Neikirk, D.P.; Tong, P.P.; Rutledge, D.B.; Park, H.; Young, P.E. (Division of Engineering and Applied Science, California Institute of Technology, Pasadena, California 91125). *Applied Physics Letters;* **41**: No. 4, 329-331(15 Aug 1982). Contract AM03-76SF00010.

A focal-plane imaging antenna array has been demonstrated at 119 μm. The array is a line of evaporated silver bow-tie antennas with bismuth microbolometer detectors on a silicon substrate. Radiation is coupled into the array by a lens placed on the back of the substrate. The bolometers are thermally isolated from the silicon substrate with a half-micron layer of polyimide. The array performance is demonstrated by coherent imaging of a series of holes at half the diffraction-limited cut-off frequency.

58018 Deep level transient spectroscopy using CAMAC components. Jervis, T.R.; Teter, W.M.; Cole, T.; Dunlavy, D. (Los Alamos National Laboratory, P.O. Box 1663, MS D429, Los Alamos, New Mexico 87545). *Review of Scientific Instruments;* **53**: No. 8, 1160-1162(Aug 1982). Contract W-7405-ENG-36.

Apparatus for computer-controlled acquisition of capacitance transient data for deep level analysis is described. The system is configured for either electrical or optical excitation of deep levels in GaAs and is based on the highly flexible CAMAC interface. The system is designed to collect transient spectroscopy data in as simple a form as possible and to make use, as much as possible, of commercially available apparatus of resonable cost. Hardware requirements and connections are described as are software for data acquisition and analysis.

58019 **Reply to "Comment on 'Thermocouple temperature measurements in shock-compressed solids' ".** Bloomquist, D.D.; Sheffield, S.A. (Sandia National Laboratory, Albuquerque, New Mexico 87185). *Journal of Applied Physics;* **53**: No. 8, 5964-5965(Aug 1982). Contract AC04-76DP00789.

We disagree with the interpretation offered in the above comment. The suggestion was made that the anomalously fast response of thin-foil thermocouples reported previously is the result of strain dependence of the thermocouple response and not shock enhanced thermal equilibration. Although the emplacement geometry has a profound effect on the response of embedded thin-foil temperature gauges as noted in the above comment, the evidence presented, along with recent results discussed in this reply, do not support the conclusions presented in the above comment.

58020 **Remote lapse-rate sensing using atmospheric refraction over complex terrain.** Porch, W.M.; Green, T.J. (University of California, Lawrence Livermore National Laboratory, California 94550). *Applied Optics;* **21**: No. 6, 981-982(15 Mar 1982). Contract W-7405-ENG-48.

A technique for continuous remote lapse-rate measurements using atmospheric refraction over complex terrain has been developed. Using a vertically oriented 1024 element linear photodiode array at the focus of a C-90 Celestron to detect laser radiation, the lapse rate of the Big Sulfur Creek Valley was determined. (AIP)

58021 **Multiple-pass reflectometer.** Edwards, D.F. (Los Alamos National Lab., NM); Baumeister, P. *Applied Optics;* **20**: No. 22, 3968-3971(15 Nov 1981).

The multiple-pass reflectometer has been shown to be a convenient and precise instrument for measuring absolute spectral reflectance values in excess of 0.99. Given here is an extension of earlier work. We present details of the setup, operation, parameter optimization, and some limitations of the reflectometer. For a carefully aligned instrument the precision of the measurement is limited by the uncertainty in the computer fit of a straight line to the data. For the uv and visible spectral regions, typical reflectance precision is a few parts in 10^4. Systematic errors due to nonuniform photosurfaces and astigmatism have been minimized for the setup described here.

58022 **Determination of plate contours with a servo-scanning interferometer.** Primak, W. (Argonne National Lab., IL). *Optical Engineering;* **20**: No. 3, 481-485(May 1981).

The history of Badoz's principle of linear detection of fringes having a potential precision of 5 x 10^{-6} orders and its applications to the measurement of birefringence, to ellipsometry, and to interferometry are given. The application of the principle to a servo-scanning interferometer (Twyman-Green configuration) for the calibration of the instrument, the analysis of the data, and the determination of the absolute contour of small plates is described. The problems of the interferometry and the determination of absolute contours, and the prospects for improving the precision from that attained, 1/70 fringe, to the very much greater potential of Badoz's principle are discussed.

58023 **Ultraviolet spectrograph lens.** Brixner, B.; Winkler, M.A. (Los Alamos National Lab., NM). *Proceedings of the Society of Photo-Optical Instrumentation Engineers;* **288**: 12-14(1981).

A 700-mm f/4.7 spectrograph camera lens was designed for imaging spectral lines in the 200 to 400-nm region on a 120-mm flat image field. Lens elements of fused silica and crystalline calcium fluoride have so little secondary spectrum that raytracing calculations predict a monochromatic resolution limit of 30 lines/mm without refocusing in the 238- to 365-nm region. Light scattering at the polished calcium-fluoride surfaces is avoided by sandwiching the fluoride elements between fused silica and cementing with silicone fluid. The constructed lens makes good spectrograms.

58024 **Multi-anode microchannel arrays.** Timothy, J.G. (Colorado, University, Boulder, Colo.); Mount, G.H. (Ball Corp., Ball Aerospace Systems Div., Boulder, Colo.). pp 360-368 of Los Alamos Conference on Optics. Liebenberg, D.H. Palos Verdes Estates, CA; Society of Photo-Optical Instrumentation Engineers (1979).

From Conference on Optics; Los Alamos, NM, USA (23 May 1979).

The Multi-Anode Microchannel Arrays (MAMA's) are a family of photoelectric, photon-counting array detectors being developed for use in instruments on both ground-based and spaceborne telescopes. These detectors combine high sensitivity and photometric stability with a high-resolution imaging capability. MAMA detectors can be operated in a windowless configuration at extreme-ultraviolet and soft X-ray wavelengths or in a sealed configuration at ultraviolet and visible wavelengths. Prototype MAMA detectors with up to 512 x 512 pixels are now being tested in the laboratory and telescope operation of a simple (10 x 10)-pixel visible-light detector has been initiated. The construction and modes-of-operation of the MAMA detectors are briefly described and performance data are presented.

58025 **Subnanosecond detector developments at ITT.** Eberhardt, E.H. (ITT Tube and Sensor Laboratories, Fort Wayne, IN). pp 369-377 of Los Alamos Conference on Optics. Liebenberg, D.H. Palos Verdes Estates, CA; Society of Photo-Optical Instrumentation Engineers (1979).

From Conference on Optics; Los Alamos, NM, USA (23 May 1979).

This paper describes the performance characteristics of the following four new types of subnanosecond optical detectors: (1) a triplanar phototube with 100-150 ps FWHM response and less-than-unit gain, (2) a microchannel plate photomultiplier tube with 300-500 ps FWHM response and up to one-million gain, (3) a magnetically focused, electrostatically deflected streak tube with a 10 ps time resolution capability, and (4) an all-electrostatic circular-scan streak tube with a 7 ps time resolution capability. The first two detectors convert a fast input optical pulse, or chain of pulses, directly to a fast output pulse (or output pulse chain) in a coaxial transmission line, while the latter two detectors convert a fast input optical pulse to an intensity-modulated, spatially distributed output optical image.

58026 **(SAND—82-0831) Computer simulations of 75-mm projectiles impacting sand targets.** Montgomery, S.T. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1982. Contract AC04-76DP00789. 53p. NTIS, PC A04/MF A01. Order Number DE82015796.

Results from numerical simulations of two 75 mm projectile designs impacting and penetrating at normal incidence into sand at 3000 ft/sec are described. The results indicate similar behavior for both designs. During penetration the front of the projectiles deformed plastically so that as the projectile penetrated into the sand a plastic deformation or crushing front moved from the front end of the projectile towards its back end. Accelerations at the front of the projectiles are given and compared with experimentally determined accelerations for similar conditions.

58027 **(BF-R—64.176-64.181-1) Detonation-like explosion modes. Interim report, August 1979-December 1980.** Geiger, W.; Rischbieter, F.; Stock, M.; Synofzik, R.; Moen, I.; Wilson, C.W. (Battelle-Institut e.V., Frankfurt am Main (Germany, F.R.)). Feb 1981. 303p. (In German and English). Dep. NTIS (US Sales Only), MF A01. Order Number DE82904639.

Portions of document are illegible.

In the majority of the experiments performed until now, the average flame speeds in the region outside of the partial confinement have been observed to be in the range between 320 and 750 m/s with peak overpressures up to 1.1 bar. These unexpectedly large figures may be explained by the rapid increase of the flame surface area in the outside region due to convection of the flame by the unsteady free jet from the orifice. In the case of cylindrically expanding deflagrations flame speeds of up to 400 m/s with corresponding overpressures of up to 0.64 bar have been observed, in the case of deflagrations within tubes the flame front velocities amounted up to 900 m/s. In order to obtain a rough estimate of the range of overpressures and wave velocities from the interaction between a blast wave and a flame front, calculations have been made for the incidence of a plane shock wave from behind on a plane flame front. The experimental setup has been designed and constructed on the basis of these estimates. Theoretical analyses and numerical calculations demonstrate that the temperature rise due to radian preheating is limited and the corresponding increase in flame velocity and explosion pressure is small in the case of a fuel/air cloud uniformly loaded with dust. The situation can be much more severe in the case of an isolated dust pocket within the fuel/air cloud. In this case radiation transport by remote heating is effective, hence there may be excessive preheating of the dust pocket.

58028 **(SAND—82-0198C) Comparison of TiH/sub x/- and ZrH/sub x/-$KClO_4$ pyrotechnics.** Lieberman, M.L.; Carlson, R.S.; Rittenhouse, C.T.; Fronabarger, J.W. (Sandia National Labs., Albuquerque, NM (USA); Mound Facility, Miamisburg, OH (USA); Unidynamics/Phoenix, Inc., AZ (USA)). 1982. Contract AC04-76DP00789. 16p. (CONF-820710—6). NTIS, PC A02/MF A01. Order Number DE82015262.

From 8. international pyrotechnics symposium; Steamboat Springs, CO, USA (12 Jul 1982).

Portions of document are illegible.

Pyrotechnic properties of ZrH/sub x//$KClO_4$ blends have been compared with those previously obtained for TiH/sub x//$KClO_4$ blends. The results indicate that the dependence of spark sensitivity on fuel microstructure found for the latter materials also exists for the former. Bridgewire ignition data for the ZrH/sub x//$KClO_4$ blends show that the subhydrides are more sensitive than the dihydride. Results of ballistic output testing show that the ZrH/sub x//$KClO_4$ blends yield lower outputs than those achieved with TiH/sub x//$KClO_4$ blends.

58029 **(UCRL—83838) Gruneisen-parameter measurements for high explosives.** Bloom, G.H. (Lawrence Livermore National Lab., CA (USA)). 23 Jun 1981. Contract W-7405-ENG-48. 6p. (CONF-810684—54). NTIS, PC A02/MF A01. Order Number DE82006733.

From APS conference on shock waves in condensed matter; Menlo Park, CA, USA (23 Jun 1981).

Portions of document are illegible.

The Grueneisen parameter of the explosives PBX-9404 and RX-03-BB have been measured at full and reduced density. The samples were heated in 40 ns with a 2 MeV electron beam and the pressure developed was determined with a laser interferometer.

58030 **(AD—341048/7) Underwater pressure measurements in the lagoon.** Rollosson, G.W. (Sandia Corp., Albuquerque, NM (USA)). Apr 1953. 24p. NTIS, PC A02/MF A01.

On Mike shot of Operation Ivy measurement of underwater pressures was attempted at four locations near the floor of the lagoon. Gauges were installed at distances ranging from approximately 5700 to 112,000 ft from ground zero and about 1 mile from the reef. The single usable record showed sharp pressure spikes at 0.3 and 0/6 sec after zero time. Although the later spike corresponded with the time of arrival of the air shock at the surface of the lagoon above the gauge, no satisfactory explanation for the first spike has been found. Because two of the four gauges used were apparently faulty in their operation and the recorder to which a third was connected failed to start at all, it was impossible to draw any conclusions regarding the nature or magnitude of the underwater shock.

58031 **(AD—357978/6) Minefield clearance.** Richmond, O. (Army Engineer Research and Development Labs., Fort Belvoir, VA (USA)). Feb 1954. 104p. NTIS, PC A06/MF A01.

The specific objectives of the study were: (1) to determine the validity of using standard Universal indicator mine calibration constants for predicting live mine detonations under nuclear bursts, (2) to determine the effect of depth of mine burial on detonation by a nuclear burst, (3) to study the effect of sympathetic detonation in extending the radius of mine clearance under a nuclear burst; and (4) to correlate the actual mine detonation results with the basic blast parameters produced by a nuclear burst. Two thousand indicator mines and 1200 live mines were exposed to one nuclear explosion (Shot 10), in various special patterns extending out to 2700 ft from intended ground zero. Results of the test showed conclusive evidence of the ability of nuclear explosions to clear large paths through minefields. All M6 and M15 antitank mines that were buried within 6 in. of the ground surface were detonated out to 1550 ft from actual ground zero, and all M14 antipersonnel mines buried at the ground surface were detonated out to 1650 ft from actual ground zero.

58032 **(AD—362095/2) Air pressure measurements.** Swift, L.M.; Wells, E.J. (Stanford Research Inst., Menlo Park, CA (USA)). May 1955. 116p. NTIS, PC A06/MF A01.

Project 3.1 of Operation CASTLE was concerned with the measurement of pressures existing on the surfaces of a non-responsive cubical structure from Shot 3. The analysis of data was not a portion of this particular project but the data will be analyzed by other agencies and used in computations of structural loading under air blast. The definition of free-field conditions in the vicinity of the structure constituted a vital portion of the project. Free-field conditions have been analyzed and the results are included in this report. Of a total of 65 gages, 63 gave usable data, which are reported in the form of both tracings and tabulations. One Q gage and one pressure gage gave recordings which are obviously wrong and these data are therefore not reported. Due to the low yield of the shot, conditions were far from optimum so that the usefulness of the data was impaired.

58033 **(AD—370261/0) Effect on engineer bridging equipment.** Moore, G.T. (Army Engineer Research and Development Labs., Fort Belvoir, VA (USA)). Feb 1954. 122p. NTIS, PC A06/MF A01.

The purpose of Project 3.22, Operation UPSHOT-KNOTHOLE, was to indicate the vulnerability of Army prefabricated fixed bridging to atomic blast and to determine means to reduce the vulnerability. To accomplish this, two 100-ft Bailey bridge spans were erected such that one was exposed to Shot 9 and both were exposed to Shot 10 of the test series; and two single bay sections of bridging were erected to afford a comparison between Bailey and T6 bridging. The presence of a precursor wave and high dynamic pressures in the region of interest for Shot 10 severely limited the value of the results of that part of the experiment. Results indicate that an anchor cable would be the best means of limiting the response of such a bridge.

58034 **(AD—465294/7) Blast effects on tree stand.** Fons, W.L.; Storey, T.G. (Department of Agriculture, Washington, DC (USA)). Mar 1965. 48p. NTIS, PC A03/MF A01.

The tree stands on three separate islands varied from 29 to 170 acres in area with vegetation composed of broadleaf trees up to 80 ft tall and coconut palms about 40 ft tall. Several palms on the three islands were equipped with snubber wire arrangement for measuring maximum deflection. The large stand was instrumented with 16 selfrecording ground-level static overpressure gages at eight locations and two self-recording dynamic pressure gages at two locations; the two smaller stands were instrumented with two static overpressure gages each. Sample plots were established on two islands for assessing stem and limb breakage in more detail. Ground-level pressure measurements lengthwise of a large stand showed no attenuation in peak static overpressure. It was not possible to evaluate the degree of peak dynamic pressure attenuation because gages both in front of and inside the tree stand measured unrealistically high peak dynamic pressure compared to values calculated from corresponding peak static overpressure measurements. Nonuniform character of stands prohibited evaluation of shock attenuation from observations of tree damage with distance. The damage to the broadleaf trees was principally crown damage with occasional stem breakage or uprooting. The type of damage experienced was similar for moderate and high yield weapons. Observed damage from two weapons of different yields compare favorably with isodamage curves prepared for broadleaf stands.

58035 **(AD-A—108989/5) Cratering capabilities of low-yield nuclear weapons. Final report.** Strange, J.N. (Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Structures Lab.). Jul 1981. 32p. NTIS, PC A03/MF A01.

A review of past cratering experiments, both from high explosives and nuclear explosives, was conducted and the data gathered were analyzed in order to develop a generalized empirical method for predicting crater dimensions when only qualitative information on the media cratered is available. The methods developed enable crater predictions to be made in homogeneous and layered media within the stated orders of scatter. It is believed that the probability of a given crater falling within the predicted values is in the range of 0.8.

58036 **(AD-A—109480/4) Fiber Optic CODEC Link (FOCOL). Volume 1. Final report, 1 November 1978-26 January 1981.** Naumann, W.; Liles, E.; Hogg, R.D. (Effects Technology, Inc., Santa Barbara, CA (USA)). 26 Jan 1981. 65p. NTIS, PC A04/MF A01.

The fiber optic codec link was designed to meet the majority of data transmission requirements for both Underground Nuclear Weapon Effects Tests and High Explosive Tests at a substantial cost saving over current transmission methods including other multiplexing systems. The link is capable of transmitting a maximum of 92 channels of data over a fiber optic cable up to two kilometers in length. The bandwidth of the input data is switch selectable as 5kHz, 10kHz, or 20kHz. Fewer channels are available at higher bandwidths as lower bandwidth channels are paralleled to achieve higher bandwidth channels. Greater dynamic range is provided by the use of companding analog to digital converters which feature higher resolution for small signals.

58037 **(AD-A—109481/2) Fiber Optic CODEC Link (FOCOL). Volume 2 - manual. Final report, 1 November 1978-26 January 1981.** Naumann, W.; Liles, E.; Hogg, R.D. (Effects Technology, Inc., Santa Barbara, CA (USA)). 26 Jan 1981. 156p. NTIS, PC A08/MF A01.

The fiber optic codec link was designed to meet the majority of data transmission requirements for both Underground Nuclear Weapon Effects Tests and High Explosive Tests at a substantial cost saving over current transmission methods including other multiplexing systems. The link is capable of transmitting a maximum of 92 channels of data over a fiber optic cable up to two kilometers in length. The bandwidth of the input data is switch selectable as 5kHz, 10kHz, or 20kHz. Fewer channels are available at higher bandwidths as lower bandwith channels are paralleled to achieve higher bandwidth channels. Greater dynamic range is provided by the use of companding analog to digital converters which feature higher resolution for small signals. Volume 1 of the final report includes the technical discussion of the link program. Volume 2 of the final report is the manual for the link which provides a detailed description of the link and operating instructions.

58038 **(AD-A—109690/8) Places TV-track, ionosonde, and magnetometer operations. Final report, 1 April 1980-31 January 1981.** Chang, N.J.F. (SRI International, Menlo Park, CA (USA)). 1 Jun 1981. 16p. NTIS, PC A02/MF A01.

This report describes the TV tracking system, the slow-scan TV system, the KEL ionosonde, and the magnetometer that were operated in support of the PLACES experiment conducted at Eglin AFB, Florida in December 1980. A procedure for determining the proper launch time and aim point for both the beacon rockets and the probe rocket was developed after post-mission analysis of the first two releases. This procedure contributed to a successful beacon occultation for Event IRIS, and a successful probe penetration for Event JAN.

58039 **(AD-A—109717/9) Laboratory investigation of containment in underground nuclear tests. Final report, 17 December 1979-15 February 1981.** Cizek, J.C.; Florence, A.L. (SRI International, Menlo Park, CA (USA)). 15 Feb 1981. 90p. NTIS, PC A05/MF A01.

In support of the overall DNA program for stemming and containment of underground nuclear tests, existing laboratory techniques were further developed and applied to investigate the effects of a dynamically generated residual stress field on the containment of gases in exploded-device cavities. Laboratory experiments were performed on externally pressurized grout spheres containing a small explosive charge cast at the center. Immediately after detonation, water is pumped into the exploded cavity at a constant flow rate until the sphere is fractured to the outer surface. The fracture initiation pressures determined from the hydrofracture records are found to be substantially higher than those obtained in corresponding unexploded cavity experiments. This result provides a measure of the benefit to containment of the residual stress field created by the explosion. Relaxation of the residual stress field ws investigated by using a wide range of pumping rates, maintaining a constant cavity pressure for a time before hydrofracture, and by strain and stress gage measurements. An attempt was made to obtain hydrofracture records for uncoupled exploded cavities (air space around the charge). Although not successful, it was found that only a minor modification to the technique is required to provide the results.

58040 **(AD-A—109718/7) The relationship between material properties, residual stresses and cavity radius due to a nuclear explosion. Topical report, 26 September 1975-1 May 1976.** Rimer, N. (Systems, Science and Software, La Jolla, CA (USA)). 1 May 1976. 47p. (SSS-R—76-2907). NTIS, PC A03/MF A01.

The influence of material properties on the magnitude of the residual stresses around a nuclear cavity is examined. Particular attention in given to the effect on peak transverse residual stresses of parametrically varying material properties such as water content, percentage of air-filled voids, elastic properties, shear strength and depth of burial. The influence of these parametric variations on the final cavity radius is discussed. A correlation between peak residual stress and cavity radius is noted; a larger cavity radius implies a smaller residual stress.

58041 **(AD-A—109725/2) Analysis of jetting simulation experiments. Technical report.** Barthel, J.R.; Wiehe, J.W. (Systems, Science and Software, La Jolla, CA (USA)). 1 Jul 1981. 74p. (SSS-R—81-4898). NTIS, PC A04/MF A01.

This report describes calculational and analytical studies of high explosive jetting experiments designed to simulate energy injection into a nuclear line of sight. Numerous experiments were performed using identical spherical HE source embedded in wet sand. Damage was assessed by comparing the volume and depth of holes produced in aluminum target plates at the end of each pipe. An evacuated steel pipe, 19 mm o.d. and 0.3 mm thick, was the standard configuration. Many variations were used. Axially symmetric experiments produced some unexpected results, for example: use of a 2 mm jacket of lead around a standard pipe produced holes about twice as great in depth and volume as the average of the standard configurations; use of an air-filled pipe with wall thickness of 0.7 mm produced triple the standard hole size. Simplified calculation including the wall were performed for all three axisymmetric configurations in the frame of reference of a steady shock to provide guidance for the calculations of the actual configurations with a decaying shock. These produced the unexpected result that all three jet particulate mass and energy at equal rates as a steady state is approached. This result is explained by an adaptation of impulsive jetting theory. Configurations employing helical spiral asymmetries, 0.3 to 0.5 mm thick, also produced unexpected results. Spirals resting against the outer pipe wall resulted in essentially no change in target damage, whereas spirals resting against the inner wall virtually eliminated target damage.

58042 **(AD-A—109933/2) Final report.** Kardatzke, M.L.; Ellis, S.S.; Katzenstein, L.R.; Persky, M.E.; Smith, D.W. (Academy for Interscience Methodology, Chicago, IL (USA)). Dec 1980. 49p. (AIM—80-T-13). NTIS, PC A03/MF A01.

Chapters 1, 2 and 3 of this report describe technical effort directed towards the development of methods to be used in two-sided analyses. Chapter 3 describes analysis of weapon effectiveness against soft target data sets which verified the estimates provided by the National Strategic Force Mix Model, LINMIX. Chapter 4 discusses the revision of the National Strategic Force Mix Model, LINMIX. Chapter 5 and 6 are concerned with methods by which footprinting can be handled in LINMIX.

58043 **(AD-A—111419/8) Electromagnetic Pulse (EMP) handbook development for the Defense Nuclear Agency (DNA). Annual report 1 Oct 80-30 Sep 81.** Pierre, J.M. (Naval Research Lab., Washington, DC (USA)). 22 Feb 1982. 108p. (NRL-MR—4734). NTIS, PC A06/MF A01.

During FY 81, the Defense Nuclear Agency (DNA) initiated a program with the Naval Research Laboratory to provide technical and management support in the development of an electromagnetic pulse (EMP) handbook for ground based facilities. The focus of the handbook program during the first year was on the assessment of the data needs of the EMP user community and the adequacy of the existing data base. This report provides a summary of the activities, findings, and accomplishments during the past year in the EMP handbook development area.

58044 **(AD-A—995141/9) Operation Castle. Pacific Proving Grounds, spring of 1954. Report of Commander, Task Group 7.5.** (Joint Task Force Seven, Washington, DC (USA)). 1954. 57p. NTIS, PC A04/MF A01.

58045 **(SAND—82-0754) Radiation and propagation of short acoustical pulses from underground explosions.** Banister, J.R. (Sandia National Labs., Albuquerque, NM (USA)). Jun 1982. Contract AC04-76DP00789. 20p. NTIS, PC A02/MF A01. Order Number DE82020415.

Radiation and propagation of short acoustical pulses from underground nuclear explosions were analyzed. The cone of more intense radiation is defined by the ratio of sound speeds in the ground and air. The pressure history of the radiated pulse is a function of the vertical ground-motion history, the range, the burial depth, and the velocity of longitudinal seismic waves. The analysis of short-pulse propagation employed an N-wave model with and without enegy conservation. Short pulses with initial wave lengths less than 100 m are severely attenuated by the energy loss in shocks and viscous losses in the wave interior. The methods developed in this study should be useful for system analysis.

58046 **(UCID—19437) Introduction to nuclear test engineering.** O'Neal, W.C.; Paquette, D.L. (Lawrence Livermore National Lab., CA (USA)). 15 Jul 1982. Contract W-7405-ENG-48. 43p. NTIS, PC A03/MF A01. Order Number DE82020700.

The basic information in this report is from a vu-graph presentation prepared to acquaint new or prospective employees with the Nuclear Test Engineering Division (NTED). Additional information has been added here to enhance a reader's understanding when reviewing the material after hearing the presentation, or in lieu of attending a presentation.

58047 **(UCRL—53277) Look at nuclear artillery yield options using JANUS, a wargame simulation code.** Andre, C.G. (Lawrence Livermore National Lab., CA (USA)). 15 Jun 1982. Contract W-7405-ENG-48. 26p. NTIS, PC A03/MF A01. Order Number DE82020454.

JANUS, a two-sided, interactive wargame simulation code, was used to explore how using each of several different yield options in a nuclear artillery shell might affect a tactical battlefield simulation. In a general sense, the results or outcomes of these simulations support the results or outcomes of previous studies. In these simulations the Red player knew of the anticipated nuclear capability of the Blue player. Neither side experienced a decisive win over the other, and both continued fighting and experienced losses that, under most historical circumstances, would have been termed unacceptable - that is, something else would have happened (the attack would have been called off). During play, each side had only fragmentary knowledge of the remaining resources on the other side - thus each side desired to continue fighting on the basis of known information. We found that the anticipated use of nuclear weapons by either side affects the character of a game significantly and that, if the employment of nuclear weapons is to have a decided effect on the progress and outcome of a battle, each side will have to have an adequate number of nuclear weapons. In almost all the simulations we ran using JANUS, enhanced radiation (ER) weapons were more effective than 1-kt fission weapons in imposing overall losses on Red. The typical visibility in the JANUS simulation limited each side's ability to acquire units deep into enemy territory and so the 10-kt fission weapon was not useful against enemy tanks that were not engaged in battle. (Troop safety constraints limited its use on tanks that were engaged in direct fire with the enemy).

58048 **(UCRL—87284) FOREX: a fiber-optics diagnostic system for study of materials at high temperatures and pressures.** Smith, D.E.; Roeske, F. (Lawrence Livermore National Lab., CA (USA)). Jul 1982. Contract W-7405-ENG-48. 8p. (CONF-820822—8). NTIS, PC A02/MF A01. Order Number DE82019437.

From 26. technical symposium and exhibition of the International Society for Optical Engineering; San Diego, CA, USA (21 Aug 1982).

We have successfully fielded a Fiber Optics Radiation Experiment system (FOREX) designed for measuring material properties at high temperatures and pressures in an underground nuclear test. The system collects light from radiating materials and transmits it through several hundred meters of optical fibers to a recording station consisting of a streak camera with film readout. The use of fiber optics provides a faster time response than can presently be obtained with equalized coaxial cables over comparable distances. Fibers also have significant cost and physical size advantages over coax cables. The streak camera achieves a much higher information density than an equivalent oscilloscope system, and it also serves as the light detector. The result is a wide bandwidth high capacity system that can be fielded at a relatively low cost in manpower, space, and materials. For this experiment, the streak camera had a 120 ns time window with a 1.2 ns time resolution. Dynamic range for the system was about 1000. Beam current statistical limitations were approximately 8% for a 0.3 ns wide data point at one decade above the threshold recording intensity.

58049 **(USGS-OFR—82-137) Geologic, geophysical, and in-situ stress investigations in the vicinity of the Dining Car chimney, Dining Car/Hybla Gold Drifts, Nevada Test Site.** Townsend, D.R.; Baldwin, M.J.; Carroll, R.D.; Ellis, W.L.; Magner, J.E. (Fenix and Scisson, Inc., Mercury, NV (USA); Geological Survey, Denver, CO (USA)). 1982. Contract AI08-76DP00474. 148p. NTIS, PC A07/MF A01. Order Number DE82012239.

Portions of document are illegible.

The Hybla Gold event, detonated on Nov. 1, 1977, was conducted in the U12e.20 drifts of the E-tunnel complex beneath the surface of Rainier Mesa at the Nevada Test Site. Though the proximity of the Hybla Gold working point to the chimney of the Dining Car event was important to the experiment, the observable geologic effects from Dining Car on the Hybla Gold site were minor. Overburden above the working point is approximately 385 m (1263 ft). The pre-Tertiary surface, probably quartzite, lies approximately 254 m (833 ft) below the working point. This report comprises three chapters detailing the geologic, geophysical, and in situ stress data gathered in the period January through June 1977, in the course of mining and drilling in the Hybla Gold/Dining Car region. These investigations confirm several observations reported previously for the Rainier event, i.e., a zone of microfailure observable in thin-section and in physical properties exists adjacent to the chimney. In addition, however, a number of investigations add new information to our understanding of effects near the detonation point. Shear waves were found to be highly diagnostic in the microcracked zone near the chimney as well as zones of failure at greater range not discernible as well as zones of failure at greater range not discernible by other techniques. Extensive in situ stress measurements made by the hydrofracture and overcore techniques indicate changes in the orientation and magnitude of the pre-Dining Car stress field. The hydrofracture technique further suggests pronounced gradients in minimum stress magnitudes over short distances at some locations in the postshot stress regime.

4503 Explosion Detection

58050 (AD-A—110080/9) Regional detection of decoupled explosions, yield estimation from surface waves, two-dimensional source effects, three-dimensional earthquake modeling and automated magnitude measures. Semiannual technical report. Bache, T.C.; Murphy, J.R.; Day, S.M.; Bennett, T.J.; Shkoller, B. (Systems, Science and Software, La Jolla, CA (USA)). Jul 1980. 146p. (SSS-R—80-4594). NTIS, PC A07/MF A01.

This semiannual technical report includes summaries of five separate technical reports. These are: (1) 'A Simulation Study of the Detectability of a 5.3 KT Decoupled Explosion at Regional Distances in the Eastern United States;' (2) 'Yield Estimation from Surface Wave Recordings of Underground Explosions - A Review;' (3) 'The Contribution of Two-Dimensional Source Effects to the Far-Field Seismic Signatures of Underground Nuclear Explosions;' (4) 'Three-Dimensional Earthquake Modeling Including Nonlinear Rupture Dynamics;' (5) 'Automated Magnitudes m sub b and M sub s.

58051 (AD-A—110181/5) The investigation of the combined use of microbarometric and seismic data to detect and identify infrasonic signals. Semi-annual report No. 1, 1 Apr-30 Sep 81. Sorrells, G.G. (Teledyne Geotech, Garland, TX (USA)). 30 Dec 1981. 23p. NTIS, PC A02/MF A01.

There is a need to acquire an infrasonics monitoring capability to supplement existing atmospheric nuclear test surveillance systems. A research program to investigate the combined use of a three-component seismograph and a microbarograph to supply the desired monitoring capability is currently underway. A temporary observatory consisting of a five-element microbarograph array and a three-component, long-period seismograph system has been established near McKinney, Texas, to acquire the experimental data necessary to perform the investigation. Preliminary analysis of the data indicates that the infrasonic signal-to-noise ratio will be greater at the output of a vertical seismograph than at the output of a microbarograph in a frequency range extending roughly from 0.005 Hz to 0.05 Hz during intervals of atmospheric turbulence.

58052 (AD-A—110183/1) Relative waveform inversion. Semi-annual technical report 1 Nov 1979-30 Apr 1980. Mellman, G.R.; Kaufman, S.K. (Sierra Geophysics, Inc., Redmond, WA (USA)). Nov 1981. 77p. (SGI-R—81-048). NTIS, PC A05/MF A01.

A relative waveform inversion method has been developed which determines models that correctly predict waveform changes in a set of observed seismograms. By modeling changes in waveforms rather than absolute waveforms, a number of relatively poorly determined quantities, such as receiver function and Q, may be eliminated from the problem and greater resolution of key model parameters obtained. The method has been applied to the estimation of overall amplitude, pP amplitude and pP delay time for a suite of seven presumed underground nuclear explosions in the Eastern Kazakh region. Events divide into two populations based on pP amplitude, with events having small pP amplitude possibly showing indications of azimuthal variation in pP. The existence of events with radically different pP amplitudes suggest that biases may exist in current relative yield estimation techniques, an effect which is corrected for in the relative waveform method.

58053 (AD-A—110184/9) The use of intermediate and long period seismic waves for discrimination and yield determination. Annual Report No. 2, 1 Oct 80-30 Sep 81. Pomeroy, P.W. (Rondout Associates, Inc., Stone Ridge, NY (USA)). 1 Nov 1981. 114p. NTIS, PC A06/MF A01.

This report deals with the following subjects: (1) The use of Lg to determine yield for U.S. explosions as recorded by WWSSN stations in the United States; (2) Analyses of seismic data from the HARZER nuclear explosion as recorded at the Catskill Seismic Array (CSA) in Stone Ridge, New York; (3) Seismic noise characteristics at the CSA; and (4) The calibration and response of the CSA.

58054 (BARC—1103) Long-period seismic system at Gauribidanur. Suryavanshi, M.P. (Bhabha Atomic Research Centre, Bombay (India)). 1981. 19p. Dep. NTIS (US Sales Only),MF A01. Order Number DE82904591.

Portions of document are illegible.

This report describes the seismic long-period data acquisition system at Gauribidanur. The field electronics was designed to achieve a configuration of improved stability and dynamic range in the pass band of 0.025 to 0.1 Hz. Some typical records obtained by the system are shown. Surface wave magnitudes estimated at GBA are found to be in general agreement with those of international estimates.

58055 (FOA-C—20358-T1-Rev.) Internal seismological stations for monitoring a Comprehensive Test Ban Treaty. Dahlman, O.; Israelson, H. (Forsvarets Forskningsanstalt - FOA, Stockholm (Sweden)). Jun 1980. 48p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82903338.

Portions of document are illegible.

The possible use of internal seismological stations that might be established in the US and the USSR for the verification of a Comprehensive Test Ban on nuclear explosions are discussed. Attempts are made to assess various technical purposes that such internal stations might serve in relation to a global network of seismological stations. A description of American instrumentation developed for such stations is also presented. An extensive, non-technical summary is included.

50 ENVIRONMENTAL SCIENCES, ATMOSPHERIC

5001 Basic Studies

REFER ALSO TO CITATION(S) 58087, 59087

58056 (AD-A—111632/6) Geophysical plasmas and atmospheric modeling. Final report. Hyman, E.; Apruzese, J.; Brecht, S.; Chao, W.; Chen, J. (Science Applications, Inc., McLean, VA (USA)). Jan 1982. 450p. (SAI—82-676-WA). NTIS, PC A19/MF A01.

The work performed on this contract encompasses a wide range of topics in space plasma physics and atmospheric modeling in support of the programs of the Geophysical and Plasma Dynamics Branch of the Naval Research Laboratory (NRL). Significant results were obtained in the following areas which will be discussed in succeeding sub-sections below: (A) solar wind-magnetospheric interaction using 2D and 3D MHD computer simulations, (B) investigations of the lower hybrid drift instability, (C) double layer modeling, (D) auroral electron acceleration, (E) ELF/VLF generation in the ionosphere, (F) high altitude nuclear effects, (G) evaluations of atmospheric cooling model, (H) ozone transport, (I) limitations on stratospheric dynamics, (J) general circulation model studies, and (K) collective particle acceleration.

58057 (AD-A—111640/9) Atmospheric pressure and velocity fluctuations near the auroral electrojet. Technical report. Luhmann, J.G. (Aerospace Corp., El Segundo, CA (USA). Space Sciences Lab.). 15 Jan 1982. 40p. NTIS, PC A03/MF A01.

The low frequency pressure and velocity perturbations caused by the temporally varying Lorentz force associated with auroral electrojet activity are modelled by calculating the disturbances generated by a two-dimensional, time-dependent current system in a gravitationally stratified, isothermal, windless atmosphere. These calculations provide information about the pattern of gravity waves around the hypothetical electrojet and give estimates of the magnitudes of near-field auroral disturbances in the middle atmosphere. It is suggested that the near-field vertical wind shears may be large enough to affect the development of air turbulence in the auroral zone.

58058 (DOE/ET/03425—22) Balance of the tropospheric ozone and its relation to stratospheric intrusions indicated by cosmogenic radionuclides. Technical progress report, November 1, 1981-June 30, 1982. Reiter, R.; Kanter, H.J.; Jaeger, H.; Munzert, K.H.; Sladkovic, R. (Fraunhofer-Gesellschaft zur Foerderung der Angewandten Forschung e.V., Garmisch-Partenkirchen (Germany, F.R.). Inst. fuer Atmosphaerische Umweltforschung). Jul 1982. Contract AC02-76EV03425. 26p. NTIS, PC A03/MF A01. Order Number DE82019952.

The balance of the tropospheric ozone is studied with regard to sources and sinks. The influx of stratospheric ozone into the lower troposphere is determined by vertical profile measurements and fixed stations at three different levels. Presented are first results of the statistical analysis of the 12-year measuring series (1970 to 1981) of the cosmogenic radionuclide Be^7 used as tracer; the frequency distribution and annual variation of the Be^7 concentration are discussed. The power spectra of the Be^7 values for low frequencies ($\leqq$ 2 per year) are shown. The correlation of ozone with Be^7 is reinvestigated. The time variation of the concentration of the stratospheric aerosol after the eruption of Mt. St. Helens and other volcanoes, as detected by lidar, and their possible effect on the heat budget of the earth are studied. Possible sources of the mistery cloud, observed in early 1982, are shown.

58059 (PB—82-156613) One- and two-dimensional photochemical modeling of the chemical interactions in the middle atmosphere (0-120 km). Solomon, S. (National Center for Atmospheric Research, Boulder, CO (USA). Atmospheric Analysis and Prediction Div.). 1981. 282p. (NCAR/CT—62). NTIS, PC A13/MF A01.

Photochemical modeling studies of the middle atmosphere are described, with particular emphasis on the photochemistry of the nitrogen oxides, their production in the lower thermosphere, and possible transport to the stratosphere. A one-dimensional photochemical model which treated the troposphere and stratosphere has been extended to include the mesosphere and lower thermosphere. This model has been used to study the ion and neutral chemistry of charged particle precipitation events. The production of NO and OH by such events and their effects on atmospheric ozone in the stratosphere and mesosphere are described. A two-dimensional model has also been extended to treat the lower thermosphere and mesosphere, as well as the stratosphere and troposphere. Large amounts of NO are produced in the lower thermosphere, both by fast photoelectron impact on N2 during quiet times, and by auroral ionization. In a two-dimensional model, the NO produced can reach the stratosphere in large amounts near the pole during the polar night period. The effect of this large additional source of stratospheric NO from upper atmospheric phenomena on both stratospheric ozone and NO has been found to be substantial using presently accepted photochemistry.

58060 (PNL-SA—8633) PNL sections of draft WISPE report. Nickola, P.W. (Pacific Northwest Lab., Richland, WA (USA)). May 1980. Contract AC06-76RL01830. 83p. NTIS, PC A05/MF A01. Order Number DE82005800.

Observations and measurements of the meteorology of the southeastern United States during December 1979 in the vicinity of a power plant are presented. The temperature and humidity effects of the cooling tower plumes were investigated by tethered balloon flights. (ACR)

58061 January angular momentum balance in the OSU two-level atmospheric general circulation model. Kim, J.; Grady, W. (Climatic Research Institute and Department of Atmospheric Sciences, Oregon State University, Corvallis 97331). *Journal of the Atmospheric Sciences;* **39**: No. 5, 949-960(May 1982).

The atmospheric angular momentum balance is studied by analyzing the data during a simulated January of the Oregon State University two-level atmospheric general circulation model. Monthly zonal means of the Coriolis torques, the vertical transfer of relative angular momentum by penetrating convection, midlevel convection, background viscosity, pressure force and vertical motion, the meridional transfer of relative angular momentum by the standing zonal mean motion, standing eddies and transient motion, and the surface exchange of relative angular momentum by oceanic and continental friction and mountain torque are computed.

58062 Preliminary calculations of average storm duration and seasonal precipitation rates for the northeast sector of the United States. Thorp, J.M.; Scott, B.C. (Pacific Northwest Lab., Richland, WA). *Atmospheric Environment;* **16**: No. 7, 1763-1774(1982). Contract AC06-76RL01830.

Regional and seasonal averages of storm duration and precipitation rates are needed as input variables in models aimed at describing precipitation processes relating to acid rain and other problems. Hourly precipitation data for 77 first order weather stations were used to calculate the summer and winter regional average storm duration and average precipitation rates over the northeastern United States. Average storm duration for summer (June-July-August), and winter (December-January-February) seasons considered periods of up to three dry hours in summer storms, and up to 6 dry hours in winter storms to be part of the same storm. Thus, each storm consisted of one or more precipitation periods. The average precipitation event rates for summer and winter storms were calculated. By considering storm duration on an hourly basis, the 3-h summer storm was found to contribute the greatest fraction to total summer precipitation. Similarly, the 26-h winter storm was found to contribute the greatest fraction to winter precipitation. The summer storms typically consisted of one rain event lasting about three hours with rain rates averaging 2.5 mmh^{-1}. The 25-h winter storm averaged about 3 precipitation periods (or rain bands). Each period lasted about seven hours and had an average precipitation rate of 1.0 mmh^{-1}.

58063 Modeling the tropospheric wind field over complex terrain. Holdeman, J.T. (Oak Ridge National Lab., TN). pp 340-342 of Second symposium on the composition of the nonurban troposphere. Boston, MA; American Meteorological Society (1982). Contract W-7405-ENG-26.

Researchers describe a model developed for wind fields over complex terrain at Oak Ridge National Laboratory for use with a particle-in-cell (PIC) model for pollutant transport, dispersion, interaction and removal which is also under development.

58064 Nonstationary nocturnal drainage flow model. Rao, K.S.; Snodgrass, H.F. (National Oceanic and Atmospheric Administration, Oak Ridge, TN). *Boundary-Layer Meteorology;* **20**: 309-320(1981).

The evolution and structure of the steady state of an idealized nocturnal drainage flow over a large uniformly-sloping surface are studied usig a nonstationary model with a height-dependent eddy diffusivity profile and a specified surface cooling rate. The predicted mean velocity and temperature profiles are compared with Prandtl's stationary analytical solutions based on the assumption of a constant eddy diffusivity in the drainage layer. The effects of important physical parameters, such as the slope angle, surface cooling, atmospheric stability, and surface roughness, on the steady drainage flow are investigated.

5002 Chemicals Monitoring And Transport

REFER ALSO TO CITATION(S) 56032, 56053, 56055, 56071, 56113, 56172, 56182, 56384, 56386, 56722, 57845, 58058, 58059, 58128, 58148, 58183, 58245, 58246, 58256, 58257, 58258, 58259, 58260, 58261, 58262

58065 (ORNL-tr—4859A) **Recent results of dispersion experiments at emission heights of 50 and 100 m.** Geiss, H.; Vogt, K.J.; Ehrlich, H.G.; Polster, G. (Oak Ridge National Lab., TN (USA)). [nd]. Contract W-7405-ENG-26. Translation source information not available . 25p. NTIS, PC A02/MF A01. Order Number DE82021738.

Portions of document are illegible.

Models for the calculation of the environmental impact caused by emissions from conventional or nuclear plants are generally based on a Gaussian diffusion equation for the pollutant concentration near the ground. The necessary dispersion parameters, i.e., the standard deviations σ/sub y/ and σ/sub z/, can be empirically determined from dispersion experiments with exhaust air plumes containing tracers. In the Nuclear Research Facility Juelich 78 experiments at emission levels of 50 and 100 m have been carried out since 1970. The tests, which were carried out up to a distance of ca. 11 km, include all six diffusion categories. In order to better determine the dependency of the dispersion parameters on emission height, experiments involving the simultaneous emission of various tracer nuclides at both heights were also undertaken. The resulting dispersion parameters are representative for an area of average to great surface roughness. The dispersion parameters as well as the long-term dispersion factors calculated with them are compared with previous Juelich test results as well as with other parameter sets (Pasquill, Singer/Smith, McElroy/Pooler, Briggs). The influence of surface roughness and emission level in comparison with other systems is also discussed.

58066 (AD-A—109921/7) **Analysis of atmospheric ozone levels at commercial airplane cruise altitudes in winter and spring 1976-77. Technical paper.** Holdeman, J.D.; Nastrom, G.D. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). Apr 1981. 18p. (NASA-TP—1807). NTIS, PC A02/MF A01.

It has been speculated that the ozone sickness experienced by some airline passengers and crew members during the winter and spring of 1976-77 were induced by abnormally high concentrations of ambient atmospheric ozone. To investigate the possibility that 1976-77 was anomalous, ozone measurements from balloons for up to 13 years and from Global Atmospheric Sampling Program (GASP) equipped aircraft for 3 years have been studied. The analyses show that the winter and spring seasons of 1976-77 were averaged statistically, and no evidence was found to suggest that there was more than a usual variation in the frequency that commercial airplanes encountered high ambient ozone concentrations.

58067 (AD-A—109922/5) **Determination of theoretical sampling efficiencies for aspirated particulate matter through the DRES large-volume sampler.** Miskew, I.; Mellsen, S.B. (Defence Research Establishment Suffield, Ralston, Alberta (Canada)). Apr 1981. 45p. NTIS, PC A03/MF A01.

Sampling and collection efficiencies are calculated for a large-volume air sampler under conditions of anisokinetic as well as isokinetic flow. A mathematical model developed to evaluate a tapered-tube sampling probe was modified to obtain results for the large-volume sampler, using various particle sizes and flow velocities. These results should facilitate the prediction or correction of sampling errors in field and laboratory experiments.

58068 (AD-A—110342/3) **Ozone measurements to 48km with chemiluminescent ozone detectors. Annual progress report.** Rosen, J.M.; Hofmann, D.J. (Wyoming Univ., Laramie (USA). Dept. of Physics and Astronomy). Jan 1982. 9p. (AP—70). NTIS, PC A02/MF A01.

An inflight ozone calibrator was tested both in a laboratory environmental chamber and on a balloon flight. The results demonstrate the need for an inflight calibrator and also indicate that there may be a serious and previously unobserved temperature sensitivity problem with one of the primary ozone detectors.

58069 (AD-A—110688/9) **Breadboard gas filter correlation spectrometer for atmospheric measurement of hydrazines and nitrogen dioxide. Final report Jan 77-Apr 79.** Dick, R. (Barringer Research Ltd., Rexdale, Ontario (Canada)). Oct 1981. 31p. (TR—79-281). NTIS, PC A03/MF A01.

This report describes the efforts to build a breadboard Gas Filter Correlation Spectrometer (GFSC) for the atmospheric measurement of hydrazines and nitrogen dioxide. The instrument was configured for use as an ambient monitor, with the possibility of conversion to a remote sensor by addition of a telescope. The final detection limits for the gases were: N2H4 = .3 ppm, UDHM = .23 ppm, MMH = .22 ppm, and N02 = 9 ppm.

58070 (AD-A—110835/6) **Stratospheric reactions of peroxynitric acid. Final report, 29 September 1978-31 December 1980.** Barker, J.R.; Trevor, P.L.; Kenley, R.A.; Chang, J.; Davenport, J.E. (SRI International, Menlo Park, CA (USA)). 23 Apr 1981. 151p. (SRI—7921-F). NTIS, PC A08/MF A01.

Both HO2 and NO2 play crucial roles in the chemistry of the upper atmosphere. For several years, these two species were thought to react via a radical disproportionation reaction, although it was suggested that a longer-lived complex could be formed according to reaction (1): HO2 + NO2 + M reversible reaction HOONO2 + M. The importance of reaction (1) has recently been verified by direct observation of HO2NO2 by Fourier transform infrared spectroscopy. Moreover, the rate of reaction (1) has been measured, and its reverse reaction (-1) has been studied. Also, RRKM theory has been applied to these data for reaction (-1) so that its rate can be reliably estimated as a function of both temperature and pressure. In another publication, the effect of HO2NO2 on tropospheric photochemical smog chemistry was discussed.

58071 (BARC—1128) **Ethylene in the atmosphere and its role in aerosol formation.** Subba Ramu, M.C.; Mohan Rao, A.M.; Muraleedharan, T.S.; Vohra, K.G. (Bhabha Atomic Research Centre, Bombay (India). Div. of Radiological Protection). 1981. 30p. Dep. NTIS (US Sales Only), MF A01. Order Number DE82904596.

Portions of document are illegible.

Experiments investigating the mechanism of conversion of sulfur dioxide to sulfate aerosols in the presence of ethylene in the atmosphere are also discussed. The importance of ethylene in the atmosphere arises from the fact that its reactions in the atmosphere lead to the formation of hydroxyl and peroxy radicals which take part in rapid oxidation of gases like sulfur dioxide and oxides of nitrogen. The various intermediate reactions involved in the formation of the end products in the reactions of ethylene with other trace gases in the atmosphere are discussed. (PSB)

58072 (INIS-mf—7092, pp vp) **Environmental impacts of fossil-fuel and nuclear power plants.** Rusnak, M. (Ministerstvo Paliv a Energetiky CSSR, Prague). 1979. (In Czech). NTIS (US Sales Only), PC A09/MF A01.

From Conference on nuclear power and the environment; Zdar nad Sazavou, Czechoslovakia (2 Apr 1979).

Large power plants burning fossil fuels generate emissions with a high content of sulphur dioxide and a content of noxious aerosols and radioisotopes whose radioactivity exceeds the limits set for nuclear power plants. The main problem of nuclear power plants is to secure radiation safety namely in case of an accident even though the probability of such an event is very small. The most complicated problems are related to the treatment of spent fuel, its transport, processing and storage.

58073 (JUEL—1704) **Investigation of the electron spin resonance spectra from matrix isolated.** Trainer, M. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemie). Feb 1981. 112p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE82902420.

Portions of document are illegible.

The matrix isolation of C10 in a CO_2 matrix is investigated with the aim of providing a detection method for C10 in the stratosphere. Of main concern is the identification and interpretation of the so far unknown ESR-spectrum of matrix isolated C10. After trapping of C10 in a CO_2 matrix at 10 K a highly anisotropic ESR-spectrum is observed which can be attributed to C10. The shape and the g-values of the spectrum are characteristic for a $^2\pi$/sub 3/2/ groundstate. Some minor structure discernible on the spectrum can be related to C10 at different trapping sites. After annealing the sample at $T > 45$ K, the radical concentration diminishes and the g perpendicular peak splits into four peaks which correspond to the hyperfine splitting of C10. The values of the g and A tensors are determined by comparing the experimental spectrum with computer simulated spectra. In a simple crystal field model these values are compared with molecular parameters of C10 deduced from gas phase spectra.

58074 **(LA-UR—82-1363) Real-time monitoring of airborne beryllium, at OSHA limit levels, by time-resolved laser-induced breakdown spectroscopy.** Radziemski, L.J.; Loree, T.R.; Cremers, D.A. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENS-36. 16p. (CONF-820459—1). NTIS, PC A02/MF A01. Order Number DE82016072.

From Beryllium subwog meeting; Denver, CO, USA (19 Apr 1982).

Real-time detection of beryllium particulate is being investigated by the new technique of laser-induced breakdown spectroscopy. For beryllium detection we monitor the 313.1-nm feature of once ionized beryllium (Be II). Numerous publications describe the technique, our beryllium results, and other applications. Here we summarize the important points and describe our experiments with beryllium.

58075 **(NASA-CR—165264) Automated system for global atmospheric sampling using B-747 airliners. Final report.** Lew, K.Q.; Gustafsson, U.R.C.; Johnson, R.E. (United Air Lines, Inc., San Francisco, CA (USA)). Oct 1981. 31p. NTIS, PC A03/MF A01.

The global air sampling program utilizes commercial aircraft in scheduled service to measure atmospheric constituents. A fully automated system designed for the 747 aircraft is described. Airline operational constraints and data and control subsystems are treated. The overall program management, system monitoring, and data retrieval from four aircraft in global service is described.

58076 **(PB—82-146309) Investigation of the role of natural hydrocarbons in photochemical smog formation in California. Final report 19 Jun 79-18 Sep 80.** Winer, A.M.; Fitz, D.R.; Miller, P.R.; Stephens, E.R.; Burleson, F.R. (California Univ., Riverside (USA). Statewide Air Pollution Research Center). Mar 1981. 127p. NTIS, PC A07/MF A01.

Progress is described for a program designed to obtain data necessary for assessing the potential contribution of natural organics to the formation of photochemical air pollution in the California South Coast Air Basin (CSCAB). Needed data include knowledge of emission rates, ambient concentrations and oxidant- and aerosol-forming potential of biogenic hydrocarbons as well as estimates of vegetative biomass in the CSCAB. The following tasks have been carried out: Oxidant-precursor relationships were determined for near-ambient concentrations of a-pinene based on data obtained with a 40,000-liter dual-mode outdoor irradiation chamber. Initial measurements were made of the ambient concentrations of natural hydrocarbons emitted by relevant vegetative communities in areas free of anthropogenic emissions. Plant enclosure chambers and analytical methods were developed for measuring the emission factors of isoprene and monoterpenes from natural, ornamental and agricultural vegetation in the 'source region' of the CSCAB. Studies were made of the feasibility of applying remote imagery techniques (including LANDSAT, U-2 and low altitude photography) to the task of quantifying the extent and mass of vegetation in the 'source region' of the CSCAB.

58077 **(PB—82-151432) Hazard evaluation and technical assistance Report No. TA76-111, U.S. Secret Service vehicle garage, Washington, DC.** Ruhe, R.L. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). Jun 1977. 10p. (TA—76-111). NTIS, PC A02/MF A01.

Exposures to carbon-monoxide (630080) (CO) nitrogen dioxide (10102440) (NO2), and nitric oxide (10102439) were surveyed at the United States Secret Service (SIC-7525) Department of the Treasury, vehicle garage in Washington, D.C., on October 28, 1976. The survey was requested by the Chief of Administrative Operations Division, United States Secret Service, Department of the Treasury on behalf of an unspecified number of garage employees. Breath analyses for 7 workers revealed elevated carboxyhemoglobin (COHb) concentrations, but only 2 exceeded the OSHA standard of 50 parts per million, and these were found in heavy smokers. Nonsmokers did not exceed criteria, but did have elevated COHb. In air, CO concentrations were well within OSHA standards of 50 parts per million for an 8 hour time weighted average. No detectable concentrations of nitrogen dioxide or nitrous oxide were found. The author recommends that malfunctioning garage doors be repaired, outside air intake be kept clear of debris, automobiles be prohibited from parking at the outside air intake, local exhaust system be used when cars are serviced, and an inspection, test and evaluation of the ventilation system be performed to ensure its optimum operation.

58078 **(PB—82-157769) Hazard evaluation and technical assistance Report No. Ta 77-79, Department of Housing and Urban Development, Washington, DC.** Price, J.H. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). Feb 1978. 21p. (TA—77-79). NTIS, PC A02/MF A01.

Worker exposures to carbon monoxide (630080) (CO) were surveyed at the Housing and Urban Development (HUD) parking garage (SIC-7525) on October 25 to 27, 1977. The evaluation was requested by HUD on behalf of 3 parking attendants and about 1,000 carpool members. CO concentrations ranged from 20 to 56 parts per million (ppm). The recommended OSHA limit is 50ppm. Attendants were exposed to sufficient CO to produce carboxyhemoglobin concentrations as high as 7.3 percent as compared with NIOSH recommended criteria of 5 percent. The author concludes that a hazard exists due to CO on 1 day of exposure. He recommends an evaluation of the ventilation system, staggered departure times, increased capacity for the ventilation system, avoidance of needless idling of engines during periods of traffic congestion, employment of a traffic patrolman to direct traffic out of the garage, and the continued operation of the ventilation system until the garage is closed in the evening.

58079 **(PB—82-158312) Size selective samplers for particulate monitoring in California. Final report.** John, W.; Wall, S.; Wesolowski, J.J. (California Dept. of Health Services, Berkeley (USA). Air and Industrial Hygiene Lab.). Oct 1981. 38p. NTIS, PC A03/MF A01.

The sampling efficiency of the Size-Selective Hi-vol has been measured with monodisperse DOP particles. The cutpoint is 15 micrometers and is insensitive to flow rate. Particle deposits on the filter rate are 3% lower near the corners than in the center. Sampling a non-uniform aerosol cloud results in non-uniformity on the filter, but reduced by a factor of three. On the basis of these tests and particle bounce tests by the authors, it is concluded that this instrument is a satisfactory 'inhalable' particle sampler. The AIHL cyclone was modified to accept cassette-mounted membrane filters and retested. The pressure drop vs. flow rate curve shows the cyclone to operate in a single flow regime from 5 to 200 L/min. Using monodisperse oleic acid particles, the 50% cutpoints at 16.7, 24 and 55 L/min are found to be 3.5, 2.5 and 1.2 micrometer, respectively. The data at 55 L/min fit the same universal curve as that at lower flow rates. Deposits on the after filter were uniform to within 5%. The cyclone has been found to perform well with the new filter holder.

58080 **(PB—82-164369) Particle sampling and analysis in the California San Joaquin Valley. Final report Jul 78-Jul 80.** Heisler, S.L.; Baskett, R. (Environmental Research and Technology, Inc., Westlake Village, CA (USA)). Dec 1981. 277p. NTIS, PC A13/MF A01.

The California Central Valley experiences significant air pollution during certain times of the year. For some time, the origins of pollution have been debated. It is not certain how much of the pollution comes from transport, or how much is locally generated. As a part of a large investigation of these questions, an exploratory aerosol characterization program was conducted at the same time other air quality observations and tracer studies were undertaken. The results of the aerosol study indicate that the particulate matter sampled during short periods of the winter 1978 and summer and fall 1979 were dominated by soil dust, sulfate, nitrate and carbon. This was true of both the particles approximately less than 20 micrometers aerodynamic diameter, and approximately less than 2.5 micrometers aerodynamic diameter. Fine particles made up half or less of the material sampled. Sulfate concentrations and carbon were reasonably uniform through the months and locations sampled, but there was significantly more nitrate found in winter than in the summer. Some evidence for enrichment in ammonium was found in the aircraft data. The contributions of source to particle samples were estimated by the chemical element balance method. Blowing dust from cultivated and uncultivated land, unidentified carbon sources, and material from atmospheric chemical reactions (ammonium sulfate and nitrate) accounted for most of the material collected.

58081 **(PB—82-166133) National air quality, monitoring, and emissions trends report, 1977. Annual report.** Hunt, W.F. Jr; Frank, N.H.; Curran, T.C.; Faoro, R.; Cox, W. (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Dec 1978. 78p. (EPA—450/2-78-052). NTIS, PC A05/MF A01.

This report presents national and regional trends in air quality through 1977 for total suspended particulate, sulfur dioxide, carbon monoxide, nitrogen dioxide and oxidants. The change in the number of people exposed to air quality levels above the National Ambient Air Quality Standards (NAAQS) is emphasized. Changes in air quality levels are discussed for the Nation, the Northeast Corridor, extending from Washington, D.C. to Boston and two selected metropolitan areas: Greater Cleveland and St. Louis. Air quality monitoring during 1977 is presented in terms of the number of reporting stations by pollutant and measurement method and their status with respect to the NAAQS. A unique feature of this report is the presentation of emission density maps, by county. Nationwide emissions for the period 1970-1977 are also presented.

58082 **(PB—82-166331) Development of methods for the determination of elemental phosphorus and phosphine in air. Final report.** Barrett, W.J.; Dillon, H.K. (Southern Research Inst., Birmingham, AL (USA)). Jan 1977. 110p. (SORI-EAS—77-060). NTIS, PC A06/MF A01.

Development of a solid sorbent sampling method for the measurement of elemental phosphorus vapor concentrations in air is described. The method is based on collection of phosphorus vapor on Tenax-GC, extraction with xylene, and determination by gas chromatography with a flame photometric detector. The overall method appears to meet all of the requirements established by NIOSH for industrial hygiene applications. Efforts to develop a solid sorbent sampling method for phosphine with a nonspectrophotometric analytical finish were not entirely successful. No solid sorbent that could collect phosphine efficiently and from which phosphine could be recovered by extraction or heating was found. The most nearly satisfactory method was based on collection of phosphine by reaction with mercuric cyanide on silica gel, with subsequent regeneration of phosphine by reduction with sodium borohydride and with gas chromatographic determination of the recovered phosphine. The recovery of phosphine was, however, less than quantitative and the storage stability of the collected sample was poor.

58083 **(PB—82-167206) Acidification of rain in the presence of SO2, H2O2, O3, and HNO3.** Overton, J.H. Jr; Durham, J.L. (Northrop Services, Inc., Research Triangle Park, NC (USA)). Jan 1982. 27p. NTIS, PC A03/MF A01.

The production of acid sulfate and the accumulation of acid nitrate are calculated for falling raindrops using a physico-chemical model that accounts for the mass transfer of SO2, H2O2, O3, HNO3, and CO2. The acidification is postulated to occur through the absorption of free gaseous HNO3 and the absorption and reaction of SO2, H2O2, and O3 to yield H2SO4. Investigated are the relative effectivness of H2O2(aq) and O3(aq) for oxidizing SO2(aq) to yield H(+1) and SO-2(-2), and the role of HNO3(aq) in acidifying raindrops and influencing SO4(-2) formation. Results indicate: that H2O2 is more effective than O3, HNO3 inhibits SO4(-2) formation due to O3 oxidation, and in all cases, HNO3 is important in acidifying rain.

58084 **(PB—82-167743) Complete testing of the NIOSH method for the determination of trace metals by atomic absorption spectrophotometry.** Marks, G.E.; Knutson, E.O. (IIT Research Inst., Chicago, IL (USA)). Sep 1975. 125p. NTIS, PC A06/MF A01.

A full collaborative test is conducted for evaluation of NIOSH Analytical Method P and CAM 173, 'General Procedure for Metals.' The method is applicable to the determination of 25 metals in airborne dusts and fumes by direct aspiration atomic absorption spectrophotometry. Aerosols of cadmium, chromium, cobalt, lead, and nickel are generated using aqueous metal nitrate solutions. Results show that the overall precision of the NIOSH method is 30% for lead, the best element. The method is found to understate the aerosol concentration by 9 to 23% for the five metals.

58085 **(PB—82-167750) Study of the cost effectiveness of stationary source, mobile source and transportation controls to improve air quality. Final report Sep 79-Nov 81.** Bellomo, S.J.; Mehra, J. (BKI Associates, Inc., McLean, VA (USA)). Nov 1981. 210p. NTIS, PC A10/MF A01.

This report presents the development and application of a sketch planning approach to conducting a cost effectiveness analysis of stationary source, mobile source and transportation controls to improve air quality. The methodology consists of five steps: adjust emission inventories, determine the initial list of controls, determine direct costs and emission reduction, determine other effects (user costs, socio-economic, other environment, etc.), and evaluate control strategies using a least cost model. The application of the methodology to the Philadelphia Air Quality Control Region for evaluating hydrocarbon emissions showed that although stationary source controls were more effective in reducing hydrocarbon emissions, most of the transporation controls were more cost effective even though their direct effect on reducing hydrocarbon emissions was not that great. Further testing in other metropolitan areas is needed to verify the generality of this conclusion.

58086 **(PB—82-169913) Methodology for estimating emissions from off-highway mobile sources for the RAPS program. Final report March-September 1974.** Hare, C.T. (Southwest Research Inst., San Antonio, TX (USA)). Oct 1974. 91p. NTIS, PC A05/MF A01.

Emissions, population, and usage data existing in the technical literature have been collected and organized for the following unregulated sources: outboard motors, snowmobiles, motorcycles, lawn and garden equipment, construction equipment, industrial equipment, and farm equipment. Methodologies for estimating emissions and fuel consumption on a county basis have been developed for the sources noted above. They have been demonstrated for counties in the St. Louis Metropolitan Air Quality Control Region (AQCR), and their strengths and weaknesses have been discussed. Methods have also been developed to apportion county emissions estimates to grid elements, but they have not been demonstrated. The exhaust constituents assessed include hydrocarbons (HC), carbon monoxide (CO), oxides of nitrogen (NOx), particulate, aldehydes (RCHO), and oxides of sulfur (SOx). For outboard motors, neither particulate nor aldehyde data were available; but carbon dioxide (CO2) emissions were included.

58087 **(PB—82-172347) Chemically reacting plume experiments in the wind tunnel. Data report.** Builtjes, P.J.H. (Hoofdgroep Maatschappelijke Technologie TNO, Apeldoorn (Netherlands)). Oct 1981. 23p. NTIS, PC A02/MF A01.

This report contains the data from the experiments of a chemically reacting plume in the wind tunnel at TNO-Apeldoorn. The experiments have been carried out in the PIA-wind tunnel of TNO-Apeldoorn. In the wind tunnel the atmospheric turbulent boundary layer above grassland (carpet roughness) has been simulated.

58088 (PB—82-177874) Review of the National Ambient Air Quality Standards for Particulate Matter: assessment of scientific and technical information. Staff paper (final). (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Jan 1982. 274p. (EPA—450/5-82-001). NTIS, PC A12/MF A01.

This paper evaluates and interprets the available scientific and technical information that the EPA staff believes is most relevant to the review of primary (health) and secondary (welfare) National Ambient Air Quality Standards for Particulate Matter (PM) and presents staff recommendations on alternative approaches to revising the standards. The assessment is intended to bridge the gap between the scientific review in the EPA criteria document for particulate matter and sulfur oxides and the judgements required of the Administrator in setting ambient air quality standards for particulate matter. The major recommendations of the staff paper include the following: (1) that TSP be replaced by a new particle indicator that includes only those particles less than a nominal 10 micrometers (thoracic particles or PM(10)); (2) that the levels of both 24-hour and annual standards be revised; (3) that the statistical form of the standard should be changed; (4) consideration of a fine particle (less than 2.5 micrometers) secondary standard recognizing the advantages of combining any action with later decisions on acid deposition programs; and (5) consideration of secondary standards related to soiling and nuisance.

58089 (PB—82-179631) A method for determining helium in water. Report of investigations 1981. Holland, P.W. (Bureau of Mines, Amarillo, TX (USA). Helium Operations). Jan 1982. 23p. NTIS, PC A02/MF A01.

The Bureau of Mines has developed a method for determining helium in water for use in sampling and analyzing surface and subsurface waters for geochemical survey work. The accuracy of the analytical method is within plus or minus 10 percent for samples containing above 20 x 10 to the -8th power cc He (STP)/cc H2O. The minimum detectable helium-in-water concentration is calculated to be 2 x 10 to the -8th power cc He (STP)/cc water. Water samples are collected in 500-cc stainless steel cylinders. The dissolved gases are extracted into a cylinder of equal volume containing a known quantity of neon. The resulting gas mixture is subsequently analyzed for helium and neon-21 by mass spectrometry. The volume of helium in the sample is calculated from the mass spectrometric determination of the helium-to-neon-21 ratio, the known quantity of neon used, and the extraction efficiency of helium.

58090 (PB—82-184615) Health hazard evaluation report No. HHE-80-032-814, Magma Copper Company, San Manuel, Arizona. Apol, A.G.; Coye, M. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Surveillance, Hazard Evaluation and Field Studies). Feb 1981. 22p. (HHE—80-032-814). NTIS, PC A02/MF A01.

Personal breathing zone samples and medical evaluations of workers were performed at Magma Copper Company Smelter (SIC-3331) in San Manuel, Arizona on March 6, 1980 and from April 22 to April 23, 1980. The surveys were requested by a representative of the United Steel Workers, Local 937, to determine potential hazards to workers in the reverbatory furnace and converter departments of the smelter. Personal air samples contained cadmium (7440439), copper (7440508), and lead (7439921) concentrations below the OSHA standards of 100, 200, and 50 micrograms per cubic meter, respectively. Of the 75 samples collected for sulfur-dioxide (7446075), 14 exceeded the OSHA standard of 5 parts per million. All 92 workers examined had blood lead concentrations below 40 micrograms per 100 milliliters. Four arsenic (7440382) blood concentrations were above 100 micrograms per liter, but because of overall low arsenic concentrations in the work force these elevated values were not considered significant. Sulfur-dioxide exposure was responsible for complaints of respiratory irritation, chronic obstructive pulmonary disease, asthma and skin irritation. The authors conclude that a hazard exists at the company from exposure to sulfur-dioxide. The use of respirators during high exposures reduces hazards but does not eliminate the effects of repeated short term exposures. Recommendations include updating of the ventilation system, initiation of a respirator program, use of engineering controls to reduce airborne contamination, and worker hygiene improvements.

58091 (PB—82-188913) Dependence of nephelometer scattering coefficients on relative humidity: fronts, nocturnal disturbance, and wood smoke. Griffing, G.W. (Environmental Protection Agency, Research Triangle Park, NC (USA). Environmental Sciences Research Lab.). 1981. 36p. (EPA—600/3-82-006). NTIS, PC A03/MF A01.

The dependence of the nephelometer scattering coefficient of atmospheric air on the relative humidity at the RTP is discussed for four different meteorological examples. These examples feature (1) the passage of a low pressure system with thunderstorms, (2) the passage of a cold, dry front, (3) a nocturnal weather disturbance due to an unknown source, and (4) wood smoke aerosols from burning tree piles. Nephelometer scattering coefficient data were obtained by the use of two nephelometers. One nephelometer was operated at the ambient outside relative humidity and the other nephelometer at a different relative humidity. Using this operational mode of data acquisition, qualitative temporal information was deduced on the variations of aerosol size and number density as various meteorological parameters vary. The temporal trend of the visibility is also discussed for each example.

58092 (PB—82-190554) Determination of an empirically derived IP/TSP relationship. Final report Aug 80-Feb 81. Nelson, A.C. Jr.; Wijnberg, L. (PEDCo Environmental, Inc., Durham, NC (USA)). Apr 1982. 70p. NTIS, PC A04/MF A01.

The primary objective of this study was to provide researchers with statistical methodology for comparing data on inhalable particulate (IP) and on the IP/TSP ratios from various sites, predicting IP concentration as a function of total suspended particulate (TSP) concentration, and detecting potential outliers. Eleven sites were selected for study based on the completeness of both IP and TSP data. The frequency distributions of IP and TSP data indicate that the lognormal distribution provides a better approximation than the normal distribution. No attempt is made to derive numerical results for all the available IP/TSP data because the 11 sites are not a random selection from a population of sites. The data from these 11 sites were compared graphically by means of box plots showing the dispersion of the date, the median value, and specified percentiles. One of the major results was the study of relationships between the measurements of IP and TSP. Two forms of this relationship were compared, a simple linear one and a first order approximation to a model relating the logarithms of IP and TSP. The linear relationship was considered to be satisfactory for most applications; however, the second model form indicates that the simple ratio prediction (i.e., using a constant ratio of IP/TSP over all values of TSP) may not be appropriate for all TSP. Simple statistical test procedures are given for comparing the average ratios at two or more sites (or for two or more years at a single test site), detecting outlying observations, and for selecting IP monitoring sites based on available TSP data and a proposed standard for IP.

58093 (RR—614.71) Sulfur in the air in the capital (Helsinki) metropolitan area: ITASAT-project. Final report. Wallin, M.; Lumme, E.; Hietamaeki, M.; Rantakrans, E. (Finnish Meteorological Inst., Helsinki). 1981. 86p. (In Finnish). NTIS, PC A05/MF A01.

Methods for regionally producing and processing information about air quality, air protection measures, and determining alternative examples for air protection solutions are assessed. The sulfur dioxide content of air is predicted. The effects of various air protection measures and their cost (flue gas desulfurization, use of low sulfur heavy fuel oil) are compared.

58094 (UCRL—87829) Modeling of dispersion of heavy gases. Knox, J.B. (Lawrence Livermore National Lab., CA (USA)). Jul 1982. Contract W-7405-ENG-48. 10p. (CONF-820936—1). NTIS, PC A02/MF A01. Order Number DE82019110.

From 13. international technical meeting on air pollution modeling and its application; Toulon, France (14 Sep 1982).

The phenomenology and/or the evolution of a heavy gas spill are considered from the early times of release to when it is diluted below a prescribed level of toxicity or lower flamability limit (LFL). To the extent the processes contributing to this phenomenology are known, they are described. From this discussion, salient processes emerge whose quantification leads to the structuring of models for heavy gas dispersion. Matters dealt with in this executive summary will be covered in more detail in the full presentation.

58095 A simple automatic variable flow controller. Wolf, I.; Carpenter, R.L. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM). *Journal of the Air Pollution Control Association;* **32**: No. 7, 744-746(Jul 1982).

A simple system is reported on for flow control, using standard components, that operates in the 20 to 70 ACFM flow rate range (0.4 to 1.4 m^3/min).The method is suitable for use in laboratory and field environments or for sampling exhaust gases from coal combustors. In source sampling tests, this system has successfully operated high volume filters at 26.9 ACFM (0.55 m^3/min) and a high volume cascade impactor at 21 ACFM (0.43 m^3/min). (JMT)

58096 Investigation of accident-generated aerosols: releases from free fall spills. Sutter, S.L.; Johnston, J.W.; Mishima, J. (Pacific Northwest Lab., Richland, WA). *American Industrial Hygiene Association Journal;* **43**: No. 7, 540-543(Jul 1982).

Saftey assessments and environmental impact statements for facilities require an estimation of airborne releases. Aerosols generated by accidents are being investigated to develop the source terms for these releases. The lower boundry accidental release event would be a free fall spill of powders or liquids in static air. Experiments measured the mass airborne and particle size distribution of these aerosols as a function of source size and spill height. Spill height and source size were significant in releases of both powders and liquids. Releases can be estimated using the relationship of source quantity and spill height. If definitive information is not available, the weight % of source initially airborne from a spill in static air can be estimated as 0.12% for powder and an order of magnitude lower for liquid. Powder median aerodynamic equivalent diameters ranged from 6 to 26.5 μm; liquids 4.1 to 34 m. All of the spills produced a significant fraction of respirable particles 10μm and less.

58097 Analysis of Burro series 40-m³ LNG spill experiments. Koopman, R.P.; Cederwall, R.T.; Ermak, D.L.; Goldwire, H.C. Jr.; Hogan, W.J.; McClure, J.W.; McRae, T.G.; Morgan, D.L.; Rodean, H.C.; Shinn, J.H. (Lawrence Livermore National Lab., CA). *Journal of Hazardous Materials;* **6**: No. 1-2, 43-83(Jul 1982).

A series of nine field experiments (Burro series) were conducted to determine the transport and dispersion of vapor from spills of liquified natural gas (LNG) on water. The principal conclusions are summarized as follows: The turbulent processes in the lower atmospheric boundary layer dominated the transport and dispersion of gas for all experiments except Burro 8. Burro 8 was conducted under very low wind-speed conditions, and the gravity flow of the cold gas displaced the atmospheric flow, causing the wind speed within the cloud to drop essentially to zero. This has profound implications for hazard prediction from large accidental spills. High-frequency (3-5 Hz) gas-concentration measurements indicate that peak concentrations within the flammable limits are common with 10-s-average concentrations above 1%. This implies a larger flammable extent than averaged data or calculations would indicate. Differential boiloff of LNG was observed with resultant enrichment of ethane and propane in the cloud at later times. This ethane-enriched region propagates downwind and represents an additional hazard since it is more easily detonated than the methane-rich region. Energetic rapid phase transition (RPT) explosions, though not expected, did occur under at least two different circumstances during the Burro 6 and 9 tests. These explosions were large enough to damage the facility and raise questions about the coupling of the RPT-produced shock wave into the ethane-rich region of the cloud.

58098 A comparison of dense gas dispersion model simulations with Burro series LNG spill test results. Ermak, D.L; Chan, S.T.; Morgan, D.L.; Morris, L.K. (Lawrence Livermore National Lab., CA). *Journal of Hazardous Materials;* **6**: No. 1-2, 129-160(Jul 1982). Contract W-7405-ENG-48.

The predictions from three vapor dispersion models for cold dense gas releases are compared with the results from several 40 m³ LNG spill experiments conducted at China Lake, California, in 1980. The models vary considerably in the degree to which they approximate important physical phenomena and include restricting assumptions. The simplest model (GD), a modified Gaussian plume model, predicted a vapor cloud that was always too high and too narrow by a factor of 1.5 to 3. The second model (SLAB), a layer-averaged conservation equation model with one independent spatial variable (downwind distance), generally predicted the maximum distance to the lower flammability limit (LFL) and cloud width quite well. SLAB assumes the vertical concentration distribution is nearly uniform so that the vertical concentration gradient ($\partial c/\partial z$) is essentially zero from the ground up through most of the cloud and then very steep at the top of the cloud. This was generally not the case in these experiments, especially in the high wind speed tests, where the vertical concentration gradient was found to be more gradual throughout the cloud. The final model (FEM3) is a fully three-dimensional conservation equation model that generally predicted the concentration distribution in time and space rather well. A particular achievement of this model was the prediction of a bifurcated cloud structure observed in one experiment conducted with a low ambient wind speed. Both the SLAB and the FEM3 models accurately predicted the length of time required for the cloud to disperse to a level below the LFL, even in the low wind speed test where the vapor cloud lingered over the source region for a considerable length of time after LNG spill was terminated.

58099 Predictions for particle deposition to vegetative canopies. Slinn, W.G.N. (Pacific Northwest Lab., Richland, WA). *Atmospheric Environment;* **16**: No. 7, 1785-1794(1982).

A theoretical framework is presented for the analysis of particle dry deposition to vegetation. This framework is similar to the one used for the analysis of momentum in a vegetative canopy. In both cases, numerical integrations could be performed, but here approximate analytical solutions are sought. First, the case of momentum is re-examined, and it is suggested that the momentum source (-cp/cx) can be important in some cases. An approximate solution to the equation describing the air concentration of particles is then found, using similar approximations found to be reasonable for momentum. The result is illustrated for different collection efficiencies. C/sub d/ E, and then a specific, particle-size-dependent E is proposed based on windtunnel data obtained by Chamberlain. The results suggest that dry deposition velocities for 0.1-2.0 μm particles are typically about an order-of-magnitude smaller than values currently used in many air-quality models.

58100 Mechanistic analysis of precipitation scavenging using a one-dimensional, time-variant model. Hales, J. (Pacific Northwest Lab., Richland, WA). *Atmospheric Environment;* **16**: No. 7, 1775-1783(1982).

A one-dimensional, time-variant model of a storm system is presented. The model is coded in modular form, and as a consequence it contains a great deal of flexibility for general interpretive use. Besides describing cloud and precipitation processes, the model possesses the capability to predict the precipitation scavenging of both reactive and nonreactive pollutants. Example computations are presented to illustrate the code's application for scavenging analysis. This example is based upon an orographic rain storm, and utilizes highly parameterized descriptions of cloud and precipitation phenomena. The primary pollutants of interest are SO_2 and sulfate. Sulfate aerosol is assumed to be scavenged by a nucleation mechanism, while SO_2 scavenging proceeds via the aqueous-phase reaction $SO_2+O_3 \rightarrow SO^{2-}{}_4$. Sulfate concentrations and deposition patterns obtained via these example calculations are not set forth as definitive characterizations of the scavenging process. They do, however, reflect some of the behavior commonly exhibited by real storm systems. More detailed application of this basic model is suggested for use in the future analysis of wet-deposition phenomena.

58101 Trace metals in atmospheric deposition: a review and assessment. Galloway, J.N. (Univ. of Virginia, Charlottesville); Thornton, J.D.; Norton, S.A.; Volchok, H.L.; McLean, R.A.N. *Atmospheric Environment;* **16**: No. 7, 1677-1700(1982).

Information on nineteen metals in atmospheric deposition potentially toxic to humans and other organisms was evaluated to conclude if metal concentrations are increasing in atmospheric deposition and if these concentrations threaten human or organism health. On the basis of rates of emission, atmospheric concentrations, and known temporal trends in deposition, Ag, Cd, Cu, Pb, Sb, Se, and Zn can be expected to show the greatest increases due to human activity with little or no increases expected for Co, Mn, Ni and Tl. The limited data available supported these expectations. In some cases, dry fallout was found to be significant relative to wet deposition. Of the metals studied only As, Hg, Se and possibly Cd are in the vapor phase in the atmosphere. Relative to the impact of these increased concentrations, Hg and Pb are now being deposited in some areas at levels toxic to humans and Cd, Cu, Hg, Pb and Zn at levels toxic to other organisms

58102 **Wet deposition variability as observed by MAP3S.** Wilson, J.W.; Mohnen, V.A.; Kadlecek, J.A. (State Univ. of New York, Albany). *Atmospheric Environment;* **16**: No. 7, 1667-1676(1982).

MAP3S data for 1977-1979 are utilized to examine temporal, spatial and directional variability of wet deposition of the dominant ions in precipitation for selected sites in the northeastern United States. Linear regression analysis applied to 3-y cumulative totals is found to be applicable and provide a reasonable wet deposition predictive capability. Trajectory analysis is also applied to the data set for two stations to determine the percentage of total wet deposition associated with various approach sectors. Spatial variability in wet deposition is examined by normalizing deposition totals. No step gradients in the normalized wet deposition of pollutant-related ions were found throughout the area of study.

58103 **Trajectory analysis of MAP3S precipitation chemistry data at Ithaca, N.Y.** Henderson, R.G.; Weingartner, K. (Mitre Corp., McLean, VA). *Atmospheric Environment;* **16**: No. 7, 1657-1665(1982).

Trajectory analyses have been performed for precipitation events collected by the MAP3S station at Ithaca, N.Y. over the period October 1977 to October 1979. The analyses have shown a clear seasonal dependence of the acidity due to precipitation events associated with air mass movement. During the summer, when biological activity is high, most of the $NH^+{}_4$ and SO_4^{2-} deposited by precipitation are carried by the same air masses thus reducing the acidity of the precipitation event. Most of the acidity on a per event basis during the summer is associated with air masses which have traveled over large NO/sub x/ sources to the east. When biological activity is low, however, most of the acidity on a per event basis is associated with air masses which have travelled over large SO_2 sources to the south west.

58104 **Variation in chemical wet deposition with meteorological conditions.** Raynor, G.S.; Hayes, J.V. (Brookhaven National Lab., Upton, NY). *Atmospheric Environment;* **16**: No. 7, 1647-1656(1982).

Analysis of hourly sequential precipitation samples collected at Brookhaven National Laboratory over a 4-y period shows systematic relationships between amounts of chemicals deposited in precipitation and meteorological conditions. Samples were taken by an automatic, sequential sampler and measured for pH, conductivity and the concentrations of major ions. Concurrent measurements and observations were made of the synoptic situation, precipitation type and rate, wind speed and direction, and temperature. Deposition per unit area was computed for subsets of the data classified by meteorological and time parameters. Results demonstrate that precipitation amount alone is not an adequate predictor of chemical wet deposition because of the variability of concentration in precipitation which is a complex function of emission rates and atmospheric processes. Results, however, document those conditions under which most material is deposited and those circumstances in which deposition occurs at the greatest rate. When classified by season, hydrogen and sulfate ion deposition are greatest in the summer when precipitation is lowest and least in the winter when precipitation is greatest. Nitrogen in both nitrate and ammonium has a similar but less extreme pattern. By synoptic type, all chemicals are deposited most heavily in warm front precipitation but the fraction of hydrogen and sulfate deposited in cold front and squall line hours is greater than the fraction of precipitation. All chemicals are deposited most heavily in steady rain when examined by precipitation type but thundershowers deposit chemicals of anthropogenic origin in amounts disproportionate to precipitation amounts. Results are also presented from data classified by other parameters.

58105 **The MAP3S/RAINE precipitation chemistry network: statistical overview for the period 1976-1980.** (MAP3S/RAINE Research Community). *Atmospheric Environment;* **16**: No. 7, 1603-1631(1982).

This paper presents a basic statistical summary of the initial 3 1/2 year operating period of the MAP3S/RAINE precipitation chemistry network. The overview considers statistical features of the precipitation event data base, including temporal and variable-pair behavior and spatial (site-to-site) relationships. Seasonal variations in concentrations of the species total sulfur, SO_2, free hydrogen ion and NH_4^+ are easily identifiable from both event and monthly average time trend analyses. Species-pair correlations are generally strong and positive among the major ionic species total S, nitrate, free hydrogen and ammonium; variations from this trend at individual sites can be related to geographical location. Though reasonable coherency is exhibited in site-to-site correlation analyses, the questions of proper averaging time and network density make interpretation of spatial statistics difficult. It is anticipated that this summary will be a directly useful resource for wet-deposition assessment in the northeastern United States, and should compose a convenient starting point for more detailed analysis by the extended research community.

58106 **Theoretical estimates of the scavenging coefficient for soluble aerosol particles as a function of precipitation type, rate and altitude.** Scott, B.C. (Pacific Northwest Lab., Richland, WA). *Atmospheric Environment;* **16**: No. 7, 1753-1762(1982). Contract AC06-76RL01830.

Wet removal coefficients are derived for rain and snow. The parameterizations are intended for regional or mesoscale models and are meant to apply for soluble particles that are incorporated into the cloud liquid water via nucleation. The wet removal coefficients are shown to be a function of precipitation rate which, in turn, is a function of altitude. This altitude dependency is determined from a series of transcendental equations and is related to height of the freezing level and form of precipitation at the ground (i.e. rain vs snow).

58107 **Predictions of in-cloud conversion rates of SO_2 to SO_4 based upon a simple chemical and kinematic storm model.** Scott, B.C. (Pacific Northwest Lab., Richland, WA). *Atmospheric Environment;* **16**: No. 7, 1735-1752(1982). Contract AC06-76RL01830.

A simple chemical model has been combined with a kinematic storm model in order to present a methodology for computing the percentage of total wet-deposited sulfate that is derived from an in-cloud conversion process. The overall model assumes that the sulfate deposited in precipitation originates from either nucleation of pre-existing particles or from aqueous-phase conversion of SO_2 occurring within the precipitating cloud. The model has been run for two idealized situations representing the average winter and summer storm conditions in the northeastern United States. Seasonally averaged storm conditions and pollutant concentrations for the eastern U.S. have been used to define input conditions for sulfur inflow and storm simulation, and 55-70% of the sulfate in the summer storm simulation. The storm model predicts time available for conversion within the condensed cloud water and enables conversion rates to be computed. In both the winter and summer storm simulations, SO_2 in-cloud conversion rates were found to be between 5 and 20% h^{-1}. Based upon calculations of sulfate removal efficiencies, over 80% of the ingested sulfate aerosol was removed from the simulated summer and winter storms. The storm simulations also predicted a high level source of sulfate which was attributable to in-cloud conversion of SO_2 at levels where removal by precipitation was neglibible. These findings should not be generalized to include any winter or summer storms at any location. To do so would require many simulations with data relating particular pollutant surface deposition patterns to specific inflow concentrations of pollutants. Such data are not available.

58108 In-cloud and below-cloud scavenging of nitric acid vapor. Levine, S.Z.; Schwartz, S.E. (Brookhaven National Lab., Upton, NY). *Atmospheric Environment;* **16**: No. 7, 1725-1734(1982). Contract AC02-76CH00016.

Scavenging coefficients,Λ, for the removal of HNO_3 vapor from the atmosphere by both cloud and rain drops have been calculated for assumed models of drop-size distribution. For cumulus clouds a value of $0.2s^{-1}$ is estimated for Λ. Evaluation of rainfall washout coefficients gives values of Λ ranging from $1.3x10^{-5}$ to $1.5x10^{-3}s^{-1}$, depending upon the rainfall rate, upon the drop-size distribution function employed, and, strongly upon the lower limit of the raindrop size employed in the calculations. The concentration of soluble gas dissolved within a falling drop per unit fall distance is found to be a function of drop size, with the smaller drops accumulating the greater concentration. The long-term average rate of heterogeneous removal of HNO_3 is estimated in the range 1-$8x10^{-6}s^{-1}$, representing comparable contributions from dry deposition and rainfall scavenging.

58109 SMICK - A scavenging model incorporating chemical kinetics. Drewes, D.R.; Hales, J.M. (Pacific Northwest Lab., Richland, WA). *Atmospheric Environment;* **16**: No. 7, 1717-1724(1982).

A scavenging model has been developed as an advanced tool for assessing the wet deposition of reactive gases and aerosols from point-source plumes. The model describes both the microscopic and macroscopic aspects of the plume-rain interaction, and predicts the concentrations of pollutant in rain at ground-level points below the plume. Microscopic interactions treated by the model include simultaneous mass transfer and chemical reaction, both outside and within the falling raindrops. Reversibility is incorporated within the mass-transfer description, thus allowing a realistic treatment of gas scavenging. Application of the model to the washout of SO_2 from power plant plumes, both with and without the assumption of chemical reaction within droplets, is described. These results indicate that sulfate levels found in rainwater below power-plant plumes are not adequately explained by traditional aqueous-phase conversion mechanisms involving oxidation of SO_2 by oxygen, at least when such conversion is limited to the below-cloud region. The model has been documented in user's-manual form, and is suggested for use in the general assessment of deposition impacts of pollution sources such as fossil power plants.

58110 SO_2 content in precipitation and its relationship with surface concentrations of SO_2 in the air. Pena, J.A.; de Pena, R.G.; Bowersox, V.C.; Takacs, J.F. (Pennsylvania State Univ., University Park). *Atmospheric Environment;* **16**: No. 7, 1711-1715(1982).

As part of the MAP3S program, SO_2 atmospheric concentration has been monitored continuously since October 1978 and precipitation samples have been collected during the same period with two different types of collectors; the Battelle and Aerochem models. The data provided by both collectors, together with the temperature and the SO_2 data have been analyzed in order to establish the degree of correlation between the sulfur dioxide contained in the rain samples and the SO_2 air concentration, and also the contribution of the dissolved SO_2 to the acidity of the precipitation. The results can be summarized as follows: (1) the S/sub IV/ content in the rain samples collected with the Battelle collector is close to the equilibrium values corresponding to the surface SO_2 concentration in the air. The values found in the samples collected with the Aerochem are lower. These results suggest that equilibrium between the gas and liquid phases is rapidly established in the falling rain and that the equilibrium values are preserved when the samples are adequately collected and stored. (2) The contribution to the total free acidity by S/sub IV/ reaches up to 13% in the winter and goes down to practically zero in the summer. (3) The $SO^{2-}{}_4$ content in the rain is negatively correlated with the SO_2 concentration in air at the surface.

58111 Factors influencing trace metal, sulfate and hydrogen ion concentrations in rain. Lindberg, S.E. (Oak Ridge National Lab., TN). *Atmospheric Environment;* **16**: No. 7, 1701-1709(1982). Contract W-7405-ENG-26.

Precipitation collected as wetfall-only and primarily on an event basis at a site in the Tennessee Valley is a dilute sulfuric acid solution containing trace metals whose concentrations exhibit log normal distributions. The concentrations of H^+, $SO_4{}^{2-}$, Pb, Mn and Zn exhibit maxima in the warmer months in response to synoptic meteorologic conditions. These conditions result in elevated air concentrations during air stagnation and in generally lower rainfall amounts per event and hence less dilution of the scavenged rainfall amount, the rainfall parameter exerting the strongest influence on cencentrations. Concentrations are negatively correlated with rainfall duration and intensity to a lesser extent. The relationship between concentration and rainfall amount is approximately a 0.6-power relationship. Calculated scavenging ratios generally increase with increasing atmospheric particle mass-median diameter of each element and are on the order of 100 for Pb, 1000 for $SO^{2-}{}_4$ and 5000 for Cd and Mn.

58112 Time- and space-resolved measurements of particulate formation during premixed constant volume combustion. Flower, W.L.; Dyer, T.M. (Sandia Lab, Livermore, Calif). pp 26p, Paper No. CSS/CI-80-01 of Combustion Institute, Central States Section, spring meeting, 1980. Baton Rouge, LA; Combustion Institute (1980).

From Spring meeting of the Combustion Institute Central States section; Baton Rouge, LA, USA (24 Mar 1980).

Experiments to characterize and measure soot particulate formation processes are being conducted in a constant volume combustion bomb. The objective of this work is to provide insight into the origins of soot and its behavior in combustion engines. These experiments with rich, homogeneous mixtures focus on the particulate formation and agglomeration processes, because the experimental conditions of a combustion bomb most accurately simulate the early phases of combustion in an engine. 19 refs.

58113 National research and development program: environmental air. Summary. Final report, 1975-1978. Brussels, Belgium; Service de la Programmation de la Politique Scientifique (1979). 40p. (In French). NTIS, PC A03/MF A01.

The air quality in and around Gent, Belgium, was studied. Results presented cover pollution transport, epidemiology (pulmonary and respiratory diseases), and measures of interior versus exterior contaminant concentrations. Modeling software for meteorology, emissions monitoring, methodology of environment monitoring, and the economic implications of the fight against air pollution are also discussed.

58114 (PB—82-156696) Chemical, physical and biological assay of welding fume. Part II: implications of positive mutagenic tests. Stern, R.M. (Svejsecentralen, Glostrup (Denmark)). [nd]. 36p. NTIS, PC A03/MF A01.

The consequences of positive mutagenic test results on stainless steel welding fume are discussed, and the need for identification of the active material pointed out. Detailed chemical analysis indicates that hexavalent chromium is one of the active mutagens. The possible significance of the large variation in water soluble and water insoluble Cr(VI) content of MIG and MMA fume is discussed in terms of variation in human carcinogenicity of these two types of Cr(VI) compounds. Arguments for the requirement of establishing strategies to deal with positive results before tests are carried out are presented.

58115 (AD-A—104802) Atmospheric ^{222}Rn measurements at San Nicolas island during 1980. Larson, R.E.; Jeck, R.K. (Naval Research Lab., Washington, DC (USA)). Oct 1981. 10p. NTIS, PC A02/MF A01.

Radon concentration in the near surface air at San Nicolas Island, California, was measured. Unreported results for January and July 1980 are emphasized. For six of eight days during the January session the measured radon concentration was greater than 40 picocuries/cubic m corresponding to a continental air mass. Only the first day involved a maritime air mass with radon concentration less than about 6 picocuries/cubic m. In contrast to all the previous sessions, maritime, air dominated the ten day session in July 1980, with radon concentrations generally less than about 5 picocuries/cubic m.

58116 (INIS-mf—7092, pp vp) **Evaluation of radiation hygiene impacts of A-1 nuclear power plant operation.** Carach, J. (Krajska Hygienicka Stanica, Bratislava (Czechoslovakia)). 1979. (In Slovak). NTIS (US Sales Only), PC A09/MF A01.

From Conference on nuclear power and the environment; Zdar nad Sazavou, Czechoslovakia (2 Apr 1979).

The environmental impact is evaluated of the operation of the Bohunice A-1 nuclear power plant. The permissible limits are given of the amount of radioactive exhausts and liquid radioactive wastes for the period 1973 to 1977. The results are given of the analysis of the strontium 90 and cesium 137 content in radioactive fallout, the soil, wheat, lucerne, in the waste discharge into the Dudvah river and the content of strontium 90 in mil, The results show that the current state of contamination of the biosphere by the operation of nuclear power plants is not a matter to cause concern. The programme of environmental control in the area of the nuclear power plant is described.

58117 **(ISH—9) Comparison of the radiation exposure by radioactive emissions of conventional power plants and of nuclear power plants.** Bretschneider, J. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Sep 1981. 51p. (In German). Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

The emission values of radioacitve matter of coal- and nuclear power plants are based on measurements. As to the nuclear power plants mean values of the emissions are determined by means of the data of several years of operation; the emission values for the hard coal power plants are based on measurements effected in the Staudinger power plant in 1979/1980. The calculation of the radiation exposures is realized with the models and parameters of the BMI-(Federal Ministry of the Interior) computation base. Beside the dose factors of ICRP-2 the results are calculated in parallel with the dose factors according to ICRP-30. The calculated radiation exposure as a total body dose rate or effective dose rate ranges at the maximum plotted point between 0.1 and 1 mrem/a for the generation of one giga-watt-year of potential energy. This is good for LWRs as well as for the stone coal power plant. The maximum dose rates for single critical organs or tissues are below 10 mrem/a. In coal power plants the bone and the bone surface are most-exposed, while in nuclear power plants the maximum dose rates are to be expected in the thyroid gland and in the fatty tissue.

58118 **(NUREG—0837-Vol.1-No.4) NRC TLD direct radiation-monitoring network. Progress report, October-December 1981.** Costello, F.; Thompson, T.; Cohen, L. (Nuclear Regulatory Commission, King of Prussia, PA (USA). Region I). Jun 1982. 67p. GPO $7.00.

Portions of document are illegible.

This report is part of a continuous series providing data from the NRC's Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network. This report presents data for the fourth quarter of 1981. The report presents the radiation exposure levels measured in the vicinities of NRC-licensed facilities throughout the country and includes facilities under construction, as well as those which are in operation. The TLD data are reported in terms of milliroentgens and include exposures received while the dosimeters were in transit, as well as exposures received in the field. A control TLD, labeled CTL TLD in the reports, accompanied the TLD shipment during transit and was stored in a low background area while the other TLDs were in the field. The control TLD exposure is given for the purpose of comparison and as an indication of transit exposure to the field TLDs. Station numbers which are not included represent stations which have been deleted, stations for which the TLD was lost during the quarter, or stations for which the TLD is damaged. Occasionally, a control TLD is not included because it was also lost or damaged. Two sets of data are presented for each site. The first set includes the TLD station number, its direction and distance from the site, the integrated quarterly exposure for the period, and the daily exposure rate. The second set of data summarizes in tabular form the average quarterly exposure measured at three ranges of distances from the facility.

58119 **(RHO-LD—163) Environmental surveillance. Annual report for calendar year 1980.** Wheeler, R.E.; Conklin, A.W.; Elder, R.E.; Osborne, W.L.; Graham, M.J. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jul 1981. Contract AC06-77RL01030. 96p. NTIS, PC A05/MF A01. Order Number DE82005827.

Portions of document are illegible.

Environmental surveillance was conducted in the 200 Areas, the B-C cribs controlled area, and the 600 Area retired dry-waste-disposal sites to determine: (1) compliance with DOE requirements; (2) overall impact of site operations on the environment; and (3) adequacy of radioactive waste containment systems. The report describes the 1980 environmental surveillance activities. Environmental data collected during 1980 show that the ambient radiation levels and the radionuclide concentration levels in most uncontrolled areas are in compliance with applicable DOE and Rockwell guidelines. A few sites adjacent to tank farms, burial grounds, and operating facilities were found to have surface contamination that exceeded guidelines and were posted as Radiological Controlled areas during 1980. Data included measurements of radionuclides in air, water, soil and sediments, and vegetation, and measurements of external radiation. Routine radiological surveys were performed on the roadways and on the surface of the waste disposal sites.

58120 **Collection of radon with solid oxidizing reagents.** Stein, L.; Hohorst, F.A. (Argonne National Lab., IL). *Environmental Science and Technology;* **16**: No. 7, 419-422(Jul 1982).

Although it is generally considered to be inert, radon reacts spontaneously at ambient temperature with a number of fluorine-containing compounds, including dioxygenyl salts, fluoronitrogen salts, and halogen fluoride-metal fluoride complexes. A method for the collection of radon from air, using either dioxygenyl hexafluoroantimonate ($O_2^+SbF_6^-$) or hexafluoroiodine hexafluoroantimonate ($IF_6^+SbF_6^-$) reagent, is described. The air is passed though a drying tube and then through a bed of the reagent, which captures radon as a nonvolatile product. In tests with radon-air mixtures containing 45-210000 pCi/L of radon-222, more than 99% of the radon was retained by beds of powders (2.3-3.0 g of compound/cm^3) and pellets (7.5-10.9 g of compound/cm^3). The gas mixtures were designed to simulate radon-contaminated atmospheres in underground uranium mines. No dependence of collection efficiency upon radon concentration was observed. The method can be used for the analysis of radon-222 (by measurement of the γ emissions of the short-lived daughters, lead-214 and bismuth-214) and the purification of small volumes of air.

58121 **Stochastic photolyisis: A new method for measuring rates of photosensitive reactions.** Haugen, G.R.; Steinmetz, L.L.; Hieftje, G.M.; Russo, R.E. (Lawrence Livermore Laboratory, Livermore, California 04550). *Applied Spectroscopy;* **36**: No. 3, 203-209(May 1982). Contract W-7405-ENG-48.

A new method is introduced for the measurement of photochemical or photobiological reaction rates. Based on linear response theory, the method uses a randomly modulated light source rather than a pulsed one, and uses cross-correlation analysis to extract the desired kinetic information. In operation, a randomly varying light source illuminates the reaction of interest, and the resulting fluctuations in reactant (or product) concentrations are monitored. Mathematical or instrumental cross correlation of the light source variations with those in component concentration then produces the familiar kinetic decay curve. Because the new method produces only minute concentration fluctuations, it can measure reaction rates near equilibrium; moreover, equilibrium position can be shifted by superimposing on the fluctuating light intensity a dc level. Also, because cross correlation is used, the method enjoys high signal-to-noise ratios. In the present study, the utility and practicability of the new technique are demonstrated through examination of the recombination kinetics of photolytically generated iodine atoms.

The conceptual basis of the work is the definition of specific variables and functions of coupled heat and mass balance equations for ectotherms and endotherms. A hypothesis is proposed that soil moisture and temperature sequences and duration limit reproduction in lizards via egg incubation requirements and thereby are a major factor limiting the distribution of lizards. Preliminary results in deer mice suggest that it will be possible to calculate environmental limits to growth and reproductive potential in outdoor environments. (ACR)

Thesis. Submitted by T.W. Doyle. Portions of document are illegible.

A model, FORICO, was developed to simulate the natural gap succession of the lower montane rain forest in Puerto Rico. The FORICO model stochastically simulates a 1/30-ha stand, and determines, on a yearly basis, the establishment, growth, and death of individual trees. Hurricane frequency and stand damage probabilities are included to mimic storm effects common to forests of the West Indies. Validation of the model was achieved by correlating diameter distributions and species ranking of model results to field data. Comparison of hurricane and nonhurricane simulations indicates that disturbance plays an important role in maintaining the composition and species diversity of the Puerto Rican rain forest.

58127 (UCRL—86217) **Evaluation of soil damping techniques used in soil structure interaction analysis of a nuclear power plant.** Nelson, T.A. (Lawrence Livermore National Lab., CA (USA)). 24 Feb 1982. Contract W-7405-ENG-48. 15p. (CONF-820707—1). NTIS, PC A02/MF A01. Order Number DE82009014.

From International conference on soil dynamics and earthquake engineering; Southampton, UK (13 Jul 1982).

A prediction of dynamic soil properties at the site of a nuclear power plant plays a very important role in the seismic analysis of the facility. Conventional modal analysis procedures can accommodate virtually any range of equivalent elastic soil stiffness which is used to characterize the site. However, high radiation damping associated with energy dissipation in the soil half-space is difficult to accommodate in an elastic modal solution to the dynamic problem. Several methods are available to combine the soil damping with the structural damping in a composite modal damping coefficient. However, even with this convenient representation, the resulting large fractions of critical damping can make modal solutions to the problems suspect. This paper is based on experience gained in this area during studies performed for the Nuclear Regulatory Commission involving seismic analyses of power plants.

58128 **Acidic precipitation: considerations for an air quality standard.** Evans, L.S. (Brookhaven National Lab., Upton, NY); Hendrey, G.R.; Stensland, G.J.; Johnson, D.W.; Francis, A.J. *Water, Air, and Soil Pollution;* **16**: 469-509(1981).

Acid precipitation, wet or frozen precipitation with a H^+ concentration greater than 2.5 μeq l^{-1}, is a significant air pollution problem. The chief precursor anions are nitrate and sulfate. Agricultural soils may benefit because of the high N and S requirements of agricultural plants. Detrimental effects to forest soils may result if atmospheric H^+ inputs significantly add to or exceed H^+ production by soils. Acidification of fresh waters of southern Scandinavia, southwestern Scotland, southeastern Canada, and northeastern United States is caused by acid deposition. These regions have in common highly acid precipitation with volume weighted mean annual H^+ concentration of 25 μeq l^{-1} or higher and slow weathering of granitic or precambrian bedrock with thin soils deficient in minerals which would provide buffer capacity. Biological effects on fresh waters are detectable below pH 6.0; many species of plants, invertebrates, and vertebrates are progressively eliminated. Generally, fisheries are severely impacted below pH 5.0 and are completely destroyed below pH 4.8. Present documenting effects of acid precipitation on terrestrial vegetation are insufficient to establish an air quality standard. For aquatic ecosystems, current research indicates that establishing a maximum permissible value for the volume weighted annual H^+ concentration of precipitation at 25 μeq l^{-1} may protect the most sensitive areas from permanent lake acidification. Such a standard would probably protect other systems as well.

5103 Radioactive Materials Monitoring And Transport

REFER ALSO TO CITATION(S) 56332, 56369, 56376, 56378, 56379, 56380, 56388, 56414, 56721, 58116, 58119, 58166, 58184, 58283

58129 (AD—465307/7) **Radioactivity of open-sea plankton samples.** Folsom, T.R.; Jennings, F.D.; Johnson, M.W. (Scripps Institution of Oceanography, La Jolla, CA (USA)). 18 Apr 1958. 20p. NTIS, PC A02/MF A01.

Samples of marine organisms of the deep sea were collected by Scripps Institution of Oceanography (SIO) and were later analyzed by SIO and the U. S. Naval Radiological Defense Laboratory (NRDL). The objective was to ascertain and to report on the general relationship pertinent to the uptake of fission products by the marine organisms in order to form a background for more extensive tests on Operation Wigwam. Gross beta activities, beta absorption curves and gamma spectra were analyzed, after identification of the organisms. A radiochemical analysis was also performed. It was found: (1) that marine organisms concentrate activity from fallout fission products in the water by factors of the order of 1,000, (2) that the partition of fallout fission products in the ocean is profoundly influenced by biological processes and that a purely physical model is inadequate to predict distribution, (3) that the feeding mechanism of the organism does not clearly determine the amount of activity assimilated, (4) that there is evidence of fractionation of isotopes by different organisms, and (5) that there is some evidence that finely despersed activity is retained more or less proportionally with the dry weight of the organism.

58130 (CERN—81-15) **Radiological impact of the LEP project on the environment.** Goebel, K. (ed.). (European Organization for Nuclear Research, Geneva (Switzerland)). 19 Nov 1981. 190p. (In French). NTIS (US Sales Only), PC A09/MF A01. Order Number DE82701836.

Translated from the English original CERN—81-08.

The siting of the large electron-positron (LEP) accelerator, its experimental areas, and its supporting infrastructure are discussed with respect to the radiological impact on the surrounding areas and on the population in the Pays de Gex and the Canton de Geneve. The final conclusions are based on work done by the former LEP Study Group and by the LEP Radiation Working Group. The calculations and estimates show that the stray ionizing radiation, the radioactivity, and the radiation-induced noxious chemical products released by the LEP installation will have only an insignificant impact on the area, the individual members of the public, and the population as a whole. This result for LEP phase 85 can also be extrapolated under reasonable assumptions for LEP 125 - a possible future development phase of the present project.

58131 (CONF-820729—1) **Simulation of radionuclide transport in U.S. agriculture.** Sharp, R.D.; Baes, C.F. III. (Oak Ridge National Lab., TN (USA)). 1982. Contract W-7405-ENG-26. 14p. NTIS, PC A02/MF A01. Order Number DE82018164.

From Summer computer simulation conference; Denver, CO, USA (19 Jul 1982).

Because of the recent concern about the impact of energy technologies on man and related health effects, there has emerged a need for models to calculate or predict the effects of radionuclides on man. A general overview is presented of a model that calculates the ingrowth of radionuclides into man's food chain. The FORTRAN IV computer program TERRA, Transport of Environmentally Released Radionuclides in Agriculture, simulates the build-up of radionuclides in soil, four plant food compartments, in meat and milk from beef, and in the livestock food compartments that cause radionuclide build-up in milk and meat from beef. A large data set of spatially oriented parameters has been developed in conjunction with TERRA. This direct-access data set is called SITE, Specific Information on the Terrestrial Environment, and contains 35 parameters for each of 3525 half-degree longitude-latitude cells which define the lower 48 states. TERRA and SITE are used together as a package for determining radionuclide concentrations in man's food anywhere within the conterminous 48 states due to atmospheric releases.

58132 (DOE/EP—0038) **Summary of annual environmental reports for CY 1980: Department of Energy nuclear sites.** (USDOE Assistant Secretary for Environmental Protection, Safety and Emergency Preparedness, Washington, DC. Office of Operational Safety). Aug 1982. 54p. NTIS, PC A04/MF A01. Order Number DE82020467.

During CY 1980, radiation exposures to off-site populations from all Department of Energy (DOE) facilities were well within designated criteria and were similar to the 1979 levels. The maximum reported individual whole body dose to any member of the public from any DOE site was 15 mrem for the year. The total population dose within an 80 km (50 mi) radius of all sites reporting was 240 man-rem from DOE operations, compared to a total of nearly eight million man-rem to the same populations from natural sources. Nonradiological releases in site effluents were generally within prescribed regulatory limits, with several facilities having pollution abatement projects planned or under construction to correct noncompliance conditions. Inadvertent releases of radioactive and nonradioactive pollutants had no significant health or ecological impacts.

58133 (INIS-mf—7092, pp vp) **Radioactivity and ionizing radiation in Czechoslovak nuclear power plants and in their vicinity - problems of monitoring.** Melichar, Z.; Blazek, J. (Vyskumny Ustav Jadrovych Elektrarni, Jaslovske Bohunice (Czechoslovakia)); Vlcek, K. (Federalni Ministerstvo Paliv a Energetiky, Prague (Czechoslovakia)). 1979. (In Slovak). NTIS (US Sales Only), PC A09/MF A01.

From Conference on nuclear power and the environment; Zdar nad Sazavou, Czechoslovakia (2 Apr 1979).

An analysis is made of problems related to the monitoring of radioactivity and ionizing radiation in nuclear power plants and their environment. It is demonstrated that in spite of radioactive effluents the radiation dose from nuclear power plants comprises less than 1% of the total dose from the environment. A survey is given of radionuclides contributing to the total dose absorbed by certain body organs of man. Methods are described of the monitoring of radionuclides and radiation in nuclear power plants and their environment during operation of the plant.

58134 (INIS-mf—7092, pp vp) **Application of mathematical models in assessing environmental impacts of nuclear facilities.** Dlouhy, Z. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). 1979. (In Czech). NTIS (US Sales Only), PC A09/MF A01.

From Conference on nuclear power and the environment; Zdar nad Sazavou, Czechoslovakia (2 Apr 1979).

Mathematical models are divided into atmospheric models which monitor the migration of radioactive substances in the atmosphere, hydrological models which monitor the discharge of radioactive substances into the hydrosphere and their concentrations in sediments, water flora and fauna, and hydrogeological models which monitor the migration of radioactive substances in ground water. The application is described of the hydrogeological model in the evaluation of the radiation burden in the environment of the Dobronin radioactive waste disposal site. This model contains the determination of the maximal amounts of disposed radioactive substances, maximal design-basis accident, the amounts of leached radioactive substances, the calculation of the time of migration of substances in the soil, the determination of the dispersion in the aquifer and the determination of the radiation burden of the population.

58135 (INIS-mf—7092, pp vp) **Radiation monitoring systems of nuclear power plants and experience with their operation.** Moravek, J. (Vyskumny Ustav Jadrovych Elektrarni, Jaslovske Bohunice (Czechoslovakia)); Feik, K. (Atomova Elektraren Bohunice, Jaslovske Bohunice (Czechoslovakia)). 1979. (In Slovak). NTIS (US Sales Only), PC A09/MF A01.

From Conference on nuclear power and the environment; Zdar nad Sazavou, Czechoslovakia (2 Apr 1979).

Radiation monitoring is divided into the monitoring of the movement of radioactive substances in the nuclear power plant, the monitoring of the radiation situation inside the operating areas and the monitoring of the radiation situation in the environment of the nuclear power plant. Technical means for securing radiation monitoring are divided into the centralized system of radiation monitoring, sampling and portable monitoring instruments. The current state and experience gained with the operation of the A-1 and V-1 nuclear power plants in Czechoslovakia where dosimetric units have been set up for securing radiation safety are described.

58136 **(NUREG—0837-Vol.2-No.1) NRC TLD direct radiation-monitoring network. Progress report, January-March 1982.** Costello, F.; Thompson, T.; Cohen, L. (Nuclear Regulatory Commission, King of Prussia, PA (USA). Region I). Jul 1982. 186p. NTIS - GPO.

The Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network is operated by the NRC in cooperation with participating states. This report presents the radiation exposure levels measured in the vicinities of fifty-six NRC-licensed facilities throughout the country and includes facilities under construction as well as those which are in operation. A complete listing of the sites monitored is included. Each site is monitored by approximately 40 TLD stations located in concentric rings. Three sets of data are presented for each site. The first set includes the TLD station number, its direction and distance from the site, the integrated exposure for the period, and the exposure normalized to a ninety day quarter (standard quarter). The second set of data summarizes in tabular form the average exposure measured in each of the sixteen standard windrose sectors around the facility and normalized to a standard quarter. The third set of data summarizes the average exposure measured at three ranges of distances from the facility and normalized to a standard quarter. A change has been made this quarter in the number of elements being used to determine exposure on a routine basis. Previously, all four elements of the dosimeter (two lithium borate elements, two calcium sulfate elements) were used in calculating exposure. Based on studies of the reproducibility and other response factors of the dosimeter, it was determined that for routine measurements the precision of the results can be improved by using only the two calcium sulfate elements. In the event of an unusual situation involving possible exposures due to low energy photons or beta radiation, the data from the lithium borate elements will also be used.

58137 **(ORNL—5768) Agricultural production in the United States by county: a compilation of information from the 1974 census of agriculture for use in terrestrial food-chain transport and assessment models.** Shor, R.W.; Baes, C.F. III; Sharp, R.D. (Oak Ridge National Lab., TN (USA)). Jan 1982. Contract W-7405-ENG-26. 347p. NTIS, PC A15/MF A01. Order Number DE82006143.

Portions of document are illegible.

Terrestrial food-chain models that simulate the transport of environmentally released radionuclides incorporate parameters describing agricultural production and practice. Often a single set of default parameters, such as that listed in USNRC Regulatory Guide 1.109, is used in lieu of site-specific information. However, the geographical diversity of agricultural practice in the United States suggests the limitations of a single set of default parameters for assessment models. This report documents default parameters with a county-wide resolution based on analysis of the 1974 US Census of Agriculture for use in terrestrial food chain models. Data reported by county, together with state-based information from the US Department of Agriculture, Economic and Statistics Service, provided the basis for estimates of model input parameters. This report also describes these data bases, their limitations, and lists default parameters by county. Vegetable production is described for four categories: leafy vegetables; vegetables and fruits exposed to airborne material; vegetables, fruits, and nuts protected from airborne materials; and grains. Livestock feeds were analyzed in categories of hay, silage, pasture, and grains. Pasture consumption was estimated from cattle and sheep inventories, their feed requirements, and reported quantities of harvested forage. The results were compared with assumed yields of the pasture areas reported. In addition, non-vegetable food production estimates including milk, beef, pork, lamb, poultry, eggs, goat milk, and honey are described. The agricultural parameters and land use information - in all 47 items - are tabulated in four appendices for each of the 3067 counties of the US reported to the Census of Agriculture, excluding those in Hawaii and Alaska.

58138 **Field survey of the shallow land low-level radioactive waste burial site near Beatty, Nevada.** Nielson, H.L.; Wogman, N.A.; Kirby, L.J. (Battelle, Pac Northwest Lab, Richland, WA). *Proceedings of the Symposium on Waste Management;* **2**: 707-719(1981). (CONF-810217—).

From ANS waste management conference; Tucson, AZ, USA (23 Feb 1981).

High resolution gamma-ray spectrometry was used to determine radioactivity levels in surface soil at the site as part of an effort to confirm the boundaries of existing waste burial trenches, locate any additional radioactive wastes beyond the established burial area, characterize the distribution of radionuclides around the waste burial site, and determine whether movement of radioactivity from unearthed waste drums had occurred. Cesium-137, /sup 60/ Co, and some other radionuclides were measured around the perimeter fence and in the area where waste drums were excavated along the northern fence. The data are compared with information generated by subsurface pulsed radar techniques. In addition, the in-situ counting measurements were compared with analyses of soil samples taken below ground surface at each counting location.

58139 **Chemical species of migrating radionuclides at Maxey Flats and other shallow land burial sites.** Kirby, L.J. (Battelle, Pac Northwest Lab, Richland, WA). *Proceedings of the Symposium on Waste Management;* **2**: 721-733(1981). (CONF-810217—).

From ANS waste management conference; Tucson, AZ, USA (23 Feb 1981).

A research program is described for the determination of chemical species of migrating radionuclides at shallow land burial sites. An experimental trench and inert atmosphere sampling wells were installed at Maxey Flats to establish the means for study of saturated and unsaturated flow in and near a simulated waste burial trench and a waste burial trench. Preliminary results establish that plutonium exists in the subsurface water entering the experimental trench mostly in the reduced forms. Related measurements of surface distributions of radionuclides at Maxey Flats confirm that surface contamination has been retained largely within the fenced area.

5105 Site Resource And Use Studies

REFER ALSO TO CITATION(S) 56043, 56045, 56212, 56213, 56214, 56215, 56216, 56217, 56307, 56390, 58216, 58225

58140 **(PB—82-157785) Final environmental impact statement and report: North Monterey County facilities plan. Volume I.** (Monterey Peninsula Water Pollution Control Agency, CA (USA)). Aug 1977. 611p. NTIS, PC A99/MF A01.

The North Monterey County Wastewater Facilities Plan will provide additional waste treatment capacity at a consolidated regional facility to handle the reasonable growth in the North Monterey County area. The project will be constructed in three elements. This document contains the revisions and additions to the Draft EIS/EIR. These are based on the comments received and further information developed on the project. Major issues raised by Comments are: Water quality issues centered on stream flow augmentation to the Salinas River, the public health agencies' comments firmly cautioned against reusing effluent for irrigation until its health effects are adequately studied and air quality comments were supportive of the EIS' impact analysis and stress the mitigation of the projects secondary air quality impact.

58141 **Land application studies of industrial waste oils.** Watts, J.R. (Savannah River Lab., Aiken, SC); Corey, J.C.; McLead, K.W. *Environmental Pollution, Series A: Ecological and Biological;* **28**: No. 3, 165-175(Jul 1982). Contract AC09-76SR00819.

Investigations to determine the environmental consequences of land disposal of waste oil were begun in 1975 at the United States Department of Energy's Savannah River Plant near Aiken, South Carolina. Waste oil (21 litres m^{-2}) was applied and mixed thoroughly into the top 15 cm of soil. Four fertiliser levels were applied and the plots were tilled for aeration at 2 and 9 months after the oil was applied. Soil core samples, taken at 3-month intervals, showed negligible vertical migration of oil and a steady decline in the oil content of the soil. One year after the initial application, microbial activity, as measured by CO_2 emanation rate, was six times as great on the sites which had oil applied as on adjacent control sites without oil. Oil biodegradation was not affected by the fertiliser levels. Plant growth on the oil-treated plots was negligible in 1975 and was restricted in 1976. In 1977, on the non-oil plots, Digitaria was the most common species, but Richardia scabra and Diodia teres were also present in significant quantities. These species were largely excluded on the oil plots so that almost all of the vegetation was Digitaria. There was no significant difference in productivity in 1977 between oil and non-oil plots.

5106 Regulations

REFER ALSO TO CITATION(S) 56414, 57098, 57101, 57102, 57103, 57104, 57105, 57106, 57107, 58182

58142 **(DOE/ER—0058-Vol.3A) Environmental compliance guide: guidance manual for Department of Energy compliance with the Endangered Species Act.** (USDOE Assistant Secretary for Environmental Protection, Safety and Emergency Preparedness, Washington, DC. Office of the Deputy Assistant Secretary for Environment, Safety and Health). Jun 1982. 66p. NTIS, PC A04/MF A01. Order Number DE82019221.

This document provides guidance for Department of Energy (DOE) officials responsible for complying with Section 7 of the Endangered Species Act of 1973, as amended. The Endangered Species Act requires federal agencies such as DOE to ensure that none of their actions jeopardize the continued existence of endangered or threatened species or result in the destruction or adverse modification of designated critical habitat for such species. The Department is required to consult with the US Fish and Wildlife Service and/or the National Marine Fisheries Service, and if advised by these agencies that an endangered or threatened species or critical habitat may be affected, prepare a biological assessment of the effects of the proposed action. The content of a biological assessment is based on existing information on the federally protected species and habitats, data and observations from limited site surveys or visits, and consultations with local experts on the species. Information in the biological assessment is used by the responsible agencies as a basis for evaluating the effects of the proposed DOE action on species federally protected.

58143 **(PB—82-154410) Requirements and alternatives for a management information system to support hazardous waste enforcement. Final report.** Hussain, E.C. (American Univ., Washington, DC. Inst. for Applied Public Financial Management). Dec 1981. 99p. NTIS, PC A05/MF A01.

The Environmental Protection Agency administers a hazardous waste management program based on the authorities contained in the Resource Conservation and Recovery Act and the Comprehensive Environmental Response, Compensation, and Liability Act. Within the agency, the Office of Waste Programs Enforcement is responsible for administering the enforcement provisions of the hazardous waste program. The office does not have an information system that can handle the enforcement program. This report spells out the requirements for such an information system and possible alternatives for different systems to handle the enforcement job. Various constraints on the systems are also discussed.

Portions of document are illegible.

Thirty-four surveys were made in the area of Saronicos Gulf, Aegean Sea, during 1981. The stations consisted of three transects of three stations each from inshore to offshore waters. Determinations of temperature and salinity were made at 10 meter intervals. Secchi disc-light extinction, insident solar radiation, oxygen, phosphate, nitrate, nitrite, ammonia, and silicate measurements were performed at 1, 10, and 40 m depth. The results are presented in tables.

58148 **(DOE/EV/10019—2-Vol.2) Effect of increasing CO_2 on ocean biota. Volume II, Part 5. Environmental and societal consequences of a possible CO_2-induced climate change.** Holm-Hansen, O. (American Association for the Advancement of Science, Washington, DC; California Univ., San Diego, La Jolla (USA)). Jul 1982. Contract AS01-79EV10019. 26p. NTIS, PC A03/MF A01. Order Number DE82020250.

Attempts to predict the most important biological effects on the marine biota caused by increased atmospheric CO_2 concentrations and concomitant climactic changes are discussed. Particular attention is placed on phytoplankton, benthic plants, microbial cells, zooplankton, and fish stocks, and how changes in one or more of these trophic levels can result in significant changes in the nature and dynamics of the overall food web. Surface waters of the entire marine environment are considered, including the intertidal zone and estuaries; deeper waters are not considered. The major environmental factors considered are: (1) an increase in atmospheric CO_2 concentrations; (2) an increase in atmospheric temperature; (3) a decrease in pH of ocean water; and (4) an increase in atmospheric ozone concentration. The magnitude and temporal aspects of these atmospheric changes are based on previously developed models. (ERB)

58149 **(NUREG/CR—2860) Storm-surge measurements and computations for Hurricane David.** Howell, G.; Lee, D.Y.; Wang, H. (Florida Univ., Gainesville (USA). Dept. of Coastal and Oceanographic Engineering). Aug 1982. 76p. (UFL/COEL—82/005). GPO $5.00.

Portions of document are illegible.

One of the objectives of the Coastal Data Network System established and maintained by the Coastal and Oceanographic Engineering Laboratory at the University of Florida is to acquire and document storm surge data along the Florida Coast. Since the establishment of the system only one major hurricane resulted in storm surge of significance. This was Hurricane David which swept through the lower part of Florida's east coast in September 1979. Storm surge data were obtained at Miami Beach, Palm Beach, and Vero Beach. These data were analyzed and documented. In addition, the numerical storm surge model developed by Dean and Chiu was used to compute the storm surges at Palm Beach and Vero Beach to facilitate comparisons.

58150 **(PB—82-160094) South Atlantic OCS area living marine resources study: executive summary. Final report.** (South Carolina Wildlife and Marine Resources Dept., Charleston (USA). Marine Resources Research Inst.). Oct 1981. 16p. NTIS, PC A02/MF A01.

The continental shelf of the South Atlantic Bight has numerous areas of live bottom which are defined as areas containing biological assemblages consisting of such sessile invertebrates. Although live bottom areas are known to be important to commercial and recreational fisheries of the South Atlantic region, the ecology of bottom dwelling invertebrates and valuable finfish species utilizing live bottom reefs is not well understood. The primary study objectives were to characterize the invertebrate and nektonic communities associated with each live bottom area and evaluate factors which might influence community structure such as depth, latitude, bottom relief, season, and petroleum related activities.

58151 **(PB—82-171760) Environmental assessment of the Alaskan continental shelf. Volume 4. Biological studies: distribution and abundance of some epibenthic invertebrates of the northeastern Gulf of Alaska with notes on the feeding biology of selected species. Final report.** Feder, H.M.; Jewett, S.C. (Alaska Univ., College (USA). Inst. of Marine Science). Mar 1979. 811p. NTIS, PC A99/MF A01.

The operations connected with oil exploration, production, and transportation in the northeast Gulf of Alaska will present a wide spectrum of potential dangers to the marine environment. The report is an inventory of dominant invertebrates, their abundance and distribution patterns in the area of the Gulf of Alaska.

58152 **(RLO—2225-T24-49) Chemical and geochemical studies off the coast of Washington. Progress report, September 1981-July 1982.** Carpenter, R. (comp.). (Washington Univ., Seattle (USA). School of Oceanography). Jul 1982. Contract AT06-76EV70024. 20p. NTIS, PC A02/MF A01. Order Number DE82020043.

Portions of document are illegible.

Progress is reported on a series of marine chemical and geochemical investigations involving both laboratory studies and field studies off the coast of Washington. Most of the field work the past few years has been on the Washington continental shelf, slope, and the submarine canyons indenting the shelf north of the Columbia River. The aim is to provide basic data required to characterize underlying chemical and physical processes and their rates which control the distributions, concentrations, and ultimate fate of some of the potentially hazardous agents associated with fossil fuel and/or nuclear power production or transportation. Several processes of special importance in the sea, and methodologies and expertise to study them are being emphasized. Laboratory and field experiments and theories derived from them are being used iteratively to investigate: vertical transfer of trace chemicals from surface seawaters to underlying waters and sediments; processes which may transfer certain chemicals from sediments back into the overlying water column; redox processes which besides changing valence states of certain chemicals may alter their precipitation/dissolution tendencies, their biological availability and/or toxicity; and accumulation histories of potentially hazardous chemicals in sediments during the past 100 years.

58153 **Comparison of sensitivity analysis and error analysis based on a stream ecosystem model.** Gardner, R.H.; O'Neill, R.V.; Mankin, J.B.; Carney, J.H. (Oak Ridge National Lab., TN). *Ecological Modelling;* **12**: 173-190(1981).

When individual model parameters must be measured in field or laboratory experiments, the provision of feedback information for allocation of research efforts is an important function of modeling. Both sensitivity analysis and Monte Carlo error analysis can be used to determine which parameters require intensified measurement effort. When both methods are applied to a stream ecosystem model, the assumptions of sensitivity analysis are violated if reasonable estimates of measurement errors on parameters are used. Sensitivity analysis estimates a linear relationship between a state variable and a parameter and largely ignores higher order effects. In the model investigated in this study, higher-order effects dominate prediction error, and the results of sensitivity analysis are misleading. It is suggested that the simple correlation coefficient derived from analysis of Monte Carlo simulations is a more reasonable way to rank model parameters according to their contribution to prediction uncertainty. For the stream model used in this study, having variance on the four parameters, indicated as most important by sensitivity analysis, reduces prediction errors by only 2 to 6%. Halving variance on the four, completely different, parameters with the largest simple correlation coefficients reduce prediction errors by 17 to 31%.

This volume consists of appendices which include: Chemical Recognition Code List; HACS (Hazard Assessment Computer System) Systems and Error Messages; HACS Default File; Indexes to HACS Data Fields by Field Number and by Field Name; Sample Problem and Output; Lists of Chemical Recognition Codes by Hazard Assessment Model; and by Hazard Assessment Path Codes; and Descriptions of HACS Data Fields.

58155 **(ANL/EES-TM—169) Sampling and detection of tagged dredged material.** Van Loon, L.S.; McCown, D.L.; Ditmars, J.D. (Argonne National Lab., IL (USA)). Jan 1982. Contract W-31-109-ENG-38. 34p. NTIS, PC A03/MF A01. Order Number DE82016056.

Systems for sampling and detecting tagged dredged sand in the Upper Mississippi River were developed by Argonne National Laboratory for the U.S. Army Corps of Engineers, Rock Island District. The Corps plans to demonstrate main-channel disposal of dredged material, and it requires systems to detect the movement of the dredged material after the material has been placed in a deep reach of river. The dredged material in the demonstration will be tagged with sand particles coated with fluorescent dye. Argonne designed systems for: sampling of the bottom surficial sediments at discrete points along transects from a boat that employs a precision navigation system; on-board visual inspection of the samples for dyed sand in an ultraviolet light box; and photography of ultraviolet-illuminated samples. This report describes the systems and their use as well as the results of tests to determine proper settings for photographic equipment.

58156 **(CM—51) Inadequacy of one dimensional ocean models for the global carbon cycle.** Bjoerkstroem, A. (Stockholm Univ. (Sweden)). Feb 1981. 29p. NTIS, PC A03/MF A01.

An attempt is made to estimate the free parameters in a model of the oceanic carbon cycle, using GEOSECS data. It turns out to be impossible to set the parameters in a way that is compatible with the observed distributions of carbon and oxygen simultaneously. The result indicates that it may not be possible for any horizontally homogeneous ocean model to depict the carbon cycle in a satisfactory way. A model where Antarctic water is treated separately is required.

58157 (CONF-810488—4) **Simulated transport of polycyclic aromatic hydrocarbons in artificial streams.** Bartell, S.M.; Landrum, P.F.; Giesy, J.P.; Leversee, G.J. (Oak Ridge National Lab., TN (USA); National Oceanic and Atmospheric Administration, Ann Arbor, MI (USA); Michigan State Univ., East Lansing (USA); Savannah River Ecology Lab., Aiken, SC (USA)). 1981. Contract W-7405-ENG-26. 31p. NTIS, PC A03/MF A01. Order Number DE82013446.

From International symposium on energy and ecological modelling; Louisville, KY, USA (20 Apr 1981).

Portions of document are illegible.

A model was constructed to predict the pattern of flow and accumulation of three polycyclic aromatic hydrocarbons (PAH) (anthracene, naphthalene, and benzo(a)pyrene) in artificial streams located on the Savannah River Plant near Aiken, South Carolina. Predictions were based upon the premise that the fundamental chemistry of individual PAH contains useful information for predictive purposes. Model processes included volatilization, photolysis, sorption to sediments and particulates, and net accumulation by biota. Simulations of anthracene transport were compared to results of an experiment conducted in the streams. The model realistically predicted the concentration of dissolved anthracene through time and space. Photolytic degradation appeared to be a major pathway of anthracene flux from the streams.

58158 (EDF-R—81E117738) **Maintaining of the demineralized water quality in storage tanks.** Hochmueller, K.; Wandelt, E. (Electricite de France, 92 - Courbevoie. Service Etudes et Projets Thermiques et Nucleaires). Mar 1981. 12p. (In French). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702337.

Two processes for maintaining the quality of the mineralized water in storage tanks are considered. A slight overpressure of nitrogen can be created above the water, or the air flowing in the tank can be cleaned by passing it through a soda-containing lime filter.

58159 (EPRI-CS—2469) **Biofouling control assessment: a preliminary data base analysis. Final report.** Graham, J. (Lockheed Ocean Science Labs., Carlsbad, CA (USA)). Jul 1982. 215p. NTIS, PC A10/MF A01. Order Number DE82905810.

Portions of document are illegible.

Tightening regulations on the use of chlorine to control biofouling within electric utility cooling water systems have focused intense interest on biofouling growth and its control. This report documents an assessment of past and existing R & D and research needs relating to biofouling growth, control methods, and their impact on generating stations. The Atomic Industrial Forum's Power Database and a biofouling survey conducted by the NUS Corporation were analyzed. Chlorine use rates, injection times, and daily injection quantities were related to various plant and cooling water source characteristics. Chlorine remained the preferred biocide; mechanical cleaning methods ranked second. Wide variations in chlorine use were found, linked mainly to cooling water source characteristics. A brief literature review resulted in an annotated bibliography on biofouling and its control technologies, indexed by author, organization, and topic to enable rapid identification of individuals and organizations engaged in relevant research. Areas of research not adequately covered by existing data were identified as: a lack of an effective mechanism or process for rapidly determining condenser performance such that effective and timely biocide or cleaning operations could be implemented; a lack of information about the action of biocides on the biofilm layer and its breakdown; and a lack of comprehensive studies on alternate biocides.

58160 (NUREG/CR—1598) **Evaluation of catch-per-unit-effort indices used in aquatic monitoring programs at nuclear-power-plant sites.** McKenzie, D.H.; Skalski, J.R.; Simmons, M.A.; Metzger, R.M. (Pacific Northwest Lab., Richland, WA (USA)). Jul 1982. Contract AC06-76RL01830. 114p. (PNL—3369). NTIS, PC A06/MF A01 - GPO $5.50.

Catch-per-unit-effort (CPUE) indices, or the catch of fish (in numbers or weight) per defined unit of fishing effort, have been used as a fisheries management tool and in monitoring programs at nuclear power plants. An examination of CPUE techniques was conducted with the purpose of developing guidelines for evaluating monitoring programs and interpreting the resulting information. Data bases were selected for analysis from power plant monitoring programs which: (1) had an extensive data base of at least three years; (2) made use of several fish sampling methods; and (3) had monitoring designs which incorporated replicate samples from the fish communities. Two approaches to analyzing and evaluating data bases were taken. At riverine sites, the emphasis centered on applied biological and field sampling; quantitative aspects were evaluated with graphical presentations and coefficients of variation. At the remaining sites, emphasis was placed on statistical aspects and a posteriori sampling designs and hypotheses. Data analyzed from selected programs do not provide evidence to support basic assumptions of CPUE such as proportionality of CPUE to population abundance, sufficiency of CPUE to detect changes of reasonable magnitude, and capability to assess power plant-induced change through CPUE measurement. The findings indicate that CPUE indices cannot be relied on as the sole bases for assessing population changes. Future approaches should be based on a realistic framework that integrates qualitative and quantitative components and recognizes the shortcomings of CPUE as a monitoring tool.

58161 (PB—82-167677) **Manual of Standards of Quality for Drink Water Supplies (second edition).** (Indian Council of Medical Research, New Delhi). 1975. 28p. NTIS, PC A03/MF A01.

The Indian Council of Medical Research had published a 'Manual of Standards of Quality for Drinking Water Supplies' in 1962. This Manual contains revised chemical and bacteriological standards of quality for drinking water, and may be used to serve the purpose of standardization of quality for safe water supply in order to maintain public health and reduce morbidity from various water-borne diseases.

58162 (UCRL—87650) **Water-quality monitoring at the Hoe Creek test site: review and preliminary conclusions.** Wang, F.T.; Mead, S.W.; Stuermer, D.H. (Lawrence Livermore National Lab., CA (USA)). 20 May 1982. Contract W-7405-ENG-48. 42p. (CONF-820610—7). NTIS, PC A03/MF A01. Order Number DE82015759.

From American Institute of Chemical Engineers' spring meeting; Anaheim, CA, USA (8 Jun 1982).

Portions of document are illegible.

It has been shown that underground coal gasification (UCG) may introduce a broad range of residual gasification products into the groundwater of a coal aquifer. Sorption of many contaminants by the coal itself is an important factor in restricting the migration of these contaminants in the ground water. However, field studies, conducted at Lawrence Livermore National Laboratory's Hoe Creek site, have shown that sorption of organic compounds by coal is not as effective as expected, perhaps because the coal surface area is limited. Furthermore, if severe roof collapse has taken place during gasification, non-coal aquifers located above the gasified coal seam may be interconnected with the coal aquifer, and contaminants may enter these non-coal aquifers, in which sorption is even less effective. The Hoe Creek II and III experiments have provided opportunities to study the contamination of a sand aquifer located above a gasified coal seam in a hydrological recharge area. Preliminary results indicate that the water in the overlying sand aquifer is much less contaminated with organic compounds than the water in the gasified coal aquifer. In conducting these field investigations, valuable lessons ere learned concerning groundwater monitoring. A suggested monitoring strategy is discussed.

58163 **Tracing kepone contamination in James estuary sediments.** Nichols, M.M. (Virginia Inst. of Marine Sciences, Gloucester Point); Cutshall, N.H. *Re'un. Cons. Int. Explor. Mer;* **137**: 102-110(1981).

The escape of Kepone into the James River estuary, Virginia, for more than nine years produced widespread contamination of the sediments with important ecological consequences. The pollutant extended seaward more than 100 km from its source and contaminated an estimated 31 million tonnes of sediment to depths of more than 60 cm. Kepone spread through the food chain and to every segment of the environment from marshes to the channel floor. Kepone escaped mainly during high river inflow from a point source in freshwater tributaries. Near the source Kepone is associated with organic material but in the lower estuary it is adsorbed on finegrained sediment. A bulk of the contaminated sediment is transported and trapped by the estuarne circulation. It accumulates in the turbidity maximum of the middle estuary far from the source. In this zone it is deposited in less energetic sites where sedimentation is relatively fast. Contamination extends downward > 60 cm; peak concentrations at 10 to 25 cm relate to high production in 1974. The Kepone inventory is now being buried by less contaminated sediment. Recovery is most rapid in the middle estuary where contamination was most intense.

58164 **Statistical inconsistencies in the use of no-observed-effect levels in toxicity testing.** Skalski, J.R. (Battelle, Pac Northwest Lab, Richland, WA). *American Society for Testing and Materials, Special Technical Publication;* No. 737, 377-387(1981). (CONF-7910273—).

From 4. annual symposium on aquatic toxicology; Chicago, IL, USA (16 Oct 1979).

Use of the no-observed-effect level (NOEL) as an experimental end point violates the principle of negative inference, the logical basis of statistical hypothesis testing. The NOEL is based on the nonrejection of the hypothesis of no toxic effect, whereas scientific methods stress conclusions based on the rejection of a hypothesis. Failure to reject this hypothesis may result either because the concentration is "safe" or because the experimental protocol to detect a toxic response is insensitive, but the cause is indeterminant and the error rate unknown. The lowest rejected concentration tested (LRCT) is recommended as an experimental end point. By the use of LRCT the rate of misclassification is known and is equal to /alpha/. Experimental designs that emphasize both the biological and the statistical significance of LRCT end points are recommended. 18 refs.

5203 Radioactive Materials Monitoring And Transport

58165 **(IAEA-R—1757-F) Study of leakages at dam sites in fractured rocks with the aid of the borehole dilution technique. Final report for the period 15 December 1975 - 14 December 1977.** Ozbek, E. (International Atomic Energy Agency, Vienna (Austria)). Feb 1978. 32p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702353.

The connection between springs which occurred after the impoundment of Keban Lake and the lake was proved by tritium measurements. By additional application of single borehole techniques using radioisotopes as tracers it was possible to localize solution channels in the karstic aquifer as preferential paths for the water movement.

58166 **(NUREG/CP—0025) Workshop on environmental assessment.** Watson, E.C. (comp.). (Pacific Northwest Lab., Richland, WA (USA)). Jul 1982. Contract AC06-76RL01830. 157p. (PNL—4235; CONF-811257—). NTIS, PC A08/MF A01 - GPO $6.50.

From Workshop on environmental assessment; Gaithersburg, MD, USA (15 Dec 1981).

Objectives of the workshop were: to review and evaluate the state-of-the-art of environmental impact assessments as applied to the regulation of applications of nuclear energy and related ancillary systems; to identify areas where existing technology allows establishing acceptable methods or standard practices that will meet the requirements of the NRC regulations, standards and guides for both normal operations and off-standard conditions including accident considerations; to illuminate topics where existing models or analytical methods are deficient because of unverified assumptions, a paucity of empirical data, conflicting results reported in the literature or a need for observation of operation systems; to compile, analyze and synthesize a prioritized set of research needs to advance the state-of-the-art to the level which will meet all of the requirements of the Commission's regulations, standards and guides; and to develop bases for maintaining the core of regulatory guidance at the optimum level balancing technical capabilities with practical considerations of cost and value to the regulatory process. The discussion held in small group sessions on aquatic, atmospheric, and terrestrial pathways are presented. The following research needs were identified as common to all three groups: validation of models; characterization of source terms; development of screening techniques; basis for de minimis levels of contamination; and updating of objectives for environmental monitoring programs.

58167 **(NUREG/CR—2502) Users guide and documentation for adsorption and decay modifications to the USGS solute transport model. Formal report.** Tracy, J.V. (Ertec Western, Inc., Long Beach, CA (USA)). Jan 1982. 148p. NTIS, PC A07/MF A01.

Development and user documentation for the incorporation of radioactive decay and equilibrium adsorption into the MOC solute transport model of Konikow and Bredehoeft (1974) is provided. The models of radioactive decay, linear isotherm, Langmuir isotherm, and the Freudlich isotherm, are developed as well as the basic flow and conservative transport equations for a ground water system. The report includes the theoretical developments, numerical implementations, data input requirements, a listing of the computer code that is written to comply with Fortran 77 standards, sample input and sample output, and a Bibliography of selected publications on various aspects of the transport problems.

58168 **Radionuclides in Mono Lake, California.** Simpson, H.J. (Columbia Univ., Palisades, NY); Trier, R.M.; Toggweiler, J.R.; Mathieu, G.; Deck, B.L.; Olsen, C.R.; Hammond, D.E.; Fuller, C.; Ku, T.L. *Science (Washington, D.C.);* **216**: 512-514(30 Apr 1982).

Several radioisotopes of the naturally occurring uranium and thorium decay series, in addition to fallout plutonium, have unusually high concentrations in the water column of Mono Lake, a natural alkaline, saline lake. Complexing by carbonate ions appears to be responsible for the enhanced solubility of actinide elements with oxidation states of IV to VI. In contrast, fallout strontium-90 has been largely removed from the water, probably as a result of coprecipitation with calcium carbonate. The daughter/parent activity ratios of thorium, radium, and uranium isotopes suggest that thorium is removed from the water column to the sediments on time scales substantially longer than a month and that the desorption of thorium from the sediments to the water column requires less than a few years.

58169 **Elevated concentrations of actinides in Mono Lake.** Anderson, R.F.; Bacon, M.P.; Brewer, P.G. (Woods Hole Oceanographic Inst., MA). *Science (Washington, D.C.);* **216**: 514(30 Apr 1982).

Tetravalent thorium, pentavalent protactinium, hexavalent uranium, and plutonium (oxidation state uncertain) are present in much higher concentrations in Mono Lake, a saline, alkaline lake in eastern central California, than in seawater. Low ratios of actinium to protactinium and of americium to plutonium indicate that the concentrations of trivalent actinides are not similarly enhanced. The elevated concentrations of the ordinarily very insoluble actinides are maintained in solution by natural ligands, which inhibit their chemical removal from the water column, rather than by an unusually large rate of supply.

58170 **Americium interaction with calcite and aragonite surfaces in seawater.** Shanbhag, P.M.; Morse, J.W. (Texas A & M Univ., College Station). *Geochimica et Cosmochimica Acta;* **46**: No. 2, 241-246(Feb 1982). Contract AS05-79EV10306.

Observations of the distribution of ^{241}Am in the marine environment indicate that Am has a high affinity for solid surfaces. The adsorption of Am onto calcite and aragonite surfaces from seawater and related solutions has been studied, in order to establish the interaction of Am with a major component of many marine sediments. Results indicate that Am is rapidly and strongly adsorbed. This occurs even when both dissolved Am concentrations and solid to solution ratios are low. The minimum value for K/sub D/ determined is 2 x 10^5. Measurements of reaction kinetics established that Am is adsorbed from seawater at 40 times the rate per unit surface area on synthetic aragonite that it is on synthetic calcite. Approximately 15% of the difference is attributable to epitaxial influences, with the remainder being due to enhanced site competition by Mg on calcite relative to aragonite.The adsorption rate is first order with respect to Am concentration, but follows approximately the square root of the solid surface area to solution volume ratio. Adsorption rate of Am on biogenic aragonite and Mg-calcites are, within a given particle size range, close to equal. It is not possible to normalize these adsorption rates to surface area due to the differing microporous structure of biogenic carbonates. The Am adsorption rates on a shallow water calcium carbonate-rich sediment gave results which were predicted from its mineralogic mixture of components.

58171 Determination of some oxidation states of plutonium in sea water and associated particulate matter. Lovett, M.B. (Ministry of Agriculture, Fisheries and Food, Lowestoft (UK). Fisheries Radiobiological Lab.); Nelson, D.M. (Argonne National Lab., IL (USA)). pp 27-35 of Techniques for identifying transuranic speciation in aquatic environments. Proceedings of a technical committee meeting on the behaviour of transuranics in the aquatic environment and sediment-water exchanges: techniques for identifying the speciation, jointly organized by the IAEA and the CEC and held in Ispra, Italy, 24-28 March 1980. Vienna, Austria; IAEA (1981).

From Technical committee meeting on the behaviour of transuranics in the aquatic environment and sediment-water exchanges; Ispra, Italy (24 Mar 1980).

A full description is given of an analytical procedure to separate the lower oxidation states of Pu (III and IV) from the higher oxidation states (V and VI). This is possible by the simultaneous use of two isotopic tracers, ^{242}Pu(IV) and ^{236}Pu(VI), which are added as early as possible in the analytical scheme. Various aspects of the chemical processes are discussed, as are the procedures adopted for the preparation of the tracer solutions.

58172 (NUREG/CR—1939-V4) Ecological studies of wood-boring bivalves in the vicinity of the Oyster Creek Nuclear Generating Station: progress report June-August 1981. Quarterly progress report 1 Jun-31 Aug 81. Hoagland, K.E.; Crocket, L. (Lehigh Univ., Stone Harbor, NJ (USA). Wetlands Inst.). Jan 1982. 52p. NTIS, PC A04/MF A01.

The species composition, distribution, and population dynamics of wood-boring bivalves are being studied in the vicinity of the Oyster Creek Nuclear Generating Station, Barnegat Bay, New Jersey. Untreated wood test panels are used to collect organisms at 12 stations. Physiological tolerances of 3 species are also under investigation in the laboratory. Competition among the species is being analyzed. In the summer of 1981, Teredo bartschi occurred in large numbers at one station in Oyster Creek, but did not appear in significant numbers in Forked River.

58173 (PNL-SA—9978) System for remote monitoring of changes in aquatic habitat resulting from water-level fluctuations. Neitzel, D.A.; Becker, C.D.; Fickeisen, D.H. (Pacific Northwest Lab., Richland, WA (USA)). 1982. Contract AC06-76RL01830. 4p. (CONF-820837—1). NTIS, PC A02/MF A01. Order Number DE82019213.

From American Fisheries Society symposium on aquisition and utilization of aquatic habitat inventory information; Billings, MT, USA (1 Aug 1982).

We used a remote, pressure-sensitive radiotelemetry system to monitor water-level fluctuations in sloughs along the Hanford Reach of the Columbia River below Priest Rapids Dam. The sloughs are important spawning and nursery areas for smallmouth bass and other resident fish. Water levels in these sloughs fluctuated as much as 2 m in 24 hours. The impact to aquatic communities in the sloughs varied with river discharge and with air and river water temperatures. Changes in slough water temperature, which fluctuated as much as 14°C in 24 hours, were one of the major impacts to the aquatic habitat.

REFER ALSO TO CITATION(S) 56045, 56047, 56049, 56169, 56170, 56171, 56218, 56463, 56464, 56714, 58140

58174 (DOE/NBM—2016055) OTEC environmental benchmark survey Kahe Point, Oahu, May 1980-May 1981. Final report. Noda, E.K.; Bienfang, P.K.; Kimmerer, W.J.; Walsh, T.W. (Lawrence Berkeley Lab., CA (USA); Noda (E.K.) and Associates, Honolulu, HI (USA); Oceanic Inst., Waimanalo, HI (USA); Hawaii Univ., Kaneohe (USA). Hawaii Inst. of Marine Biology). Sep 1981. Contract W-7405-ENG-48. 515p. NTIS, PC A22/MF A01. Order Number DE82016055.

Portions of document are illegible.

Six biological/chemical cruises at two stations off Kahe Point, Oahu, Hawaii which took place between May 1980 and May 1981 are detailed. The objective was to evaluate the variability of physical, chemical, and biological variables within a potential OTEC siting area over a yearly cycle. The minimum ΔT observed between surface waters and 700 m was about 19°C. Nutrient concentrations showed typical profiles with the largest variability occurring at depth. Strong positive correlations exist between nitrate and both phosphate and silicate. Both dissolved organic nitrogen and phosphorus are highest in the surface mixed layer, decline through the nutricline, and become relatively constant near 900 m. Nutrient concentrations also showed significant variation with time of year and between stations in both near surface and deep water. The vertical distribution of chlorophyll a showed a maximum between 55 m and 120 m. The euphotic zone extended to about 130 m. Total biomass concentrations were uniform in the upper 80 m declining with depth. Primary productivity was uniform with depth down to 90 m and then declined. Phytoplankton measurements varied mainly with depth and time of year. Zooplankton biomass and number were higher in surface waters and decreased with depth. As with nutrient and phytoplankton data, zooplankton variability was greatest with depth. However, zooplankton measurements showed significant differences between day and night. Additionally, small but significant variations due to time of year and station-to-station were observed. Zooplankton taxonomic analyses from these two sites were consistent with analyses from other tropical sites.

58175 (PB—82-159674) Water resources data for West Virginia, water year 1980. Appendix - coal areas. Water-data report 1 Oct 1970-30 Sep 1980. (Geological Survey, Charleston, WV (USA). Water Resources Div.). Oct 1981. 233p. NTIS, PC A11/MF A01.

Water resources data for the 1980 water year for coal regions of West Virginia consist of discharge and water-quality records collected during two sampling periods at 369 sites. Also included are sediment data from 26 sites. Data was collected as a part of the statewide Coal Hydrology project.

58176 (PB—82-159948) 13(a) assessment of the Rio Grande Region. Final report. (Camp Dresser and McKee, Inc., Austin, TX (USA)). Sep 1981. 87p. NTIS, PC A05/MF A01.

The report summarizes results of an assessment of water requirements, water availability and other water implications of the development of emerging, nonnuclear energy technologies in the Rio Grande Region. The technologies assessed include advanced coal combustion, geothermal energy, small-scale/low-head hydropower, and enhanced oil recovery.

58177 (PB—82-160102) South Atlantic OCS area living marine resources study. Volume I: an investigation of live bottom habitats south of Cape Fear, North Carolina. Final report. (South Carolina Wildlife and Marine Resources Dept., Charleston (USA). Marine Resources Research Inst.). Oct 1981. 329p. NTIS, PC A15/MF A01.

The major objectives of this study were to (1) characterize benthic and nektonic communities associated with representative live bottom habitats on the continental shelf of the South Atlantic Bight, and (2) evaluate factors which might influence these communities, particularly the potential for impact by offshore oil and gas activities. The study areas include nine live bottom areas located off South Carolina, Georgia and Florida.

58178 (PB—82-160110) **South Atlantic OCS area living marine resources study. Volume II: an investigation of live bottom habitats north of Cape Fear, North Carolina. Final report.** (South Carolina Wildlife and Marine Resources Dept., Charleston (USA). Marine Resources Research Inst.). Oct 1981. 146p. NTIS, PC A07/MF A01.

The major objectives of this study were to (1) characterize benthic and nektonic communities associated with representative live bottom habitats on the continental shelf of the South Atlantic Bight, and (2) evaluate factors which might influence these communities, particularly the potential for impact by offshore oil and gas activities. The report describes three study sites at the edge of the continental shelf in a 55-100m depth zone, near Cape Fear, North Carolina.

58179 (PB—82-161787) **Water resources reference base for the 13(a) assessment of the Rio Grande Region. Technical memo.** Brandes, R.J.; Kier, R.S.; Stecher, L.S. (Camp Dresser and McKee, Inc., Austin, TX (USA)). Sep 1981. 86p. NTIS, PC A05/MF A01.

The report is an assessment required by law to determine present and future water supplies for emerging energy technology. The area described is the Rio Grande region. Water quality and water law are also discussed in the report.

58180 (RHO-BWI-LD—33) **Preliminary evaluation of water-resource development and potential within the Pasco Basin.** Bell, N.M.; Leonhart, L.S. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Nov 1980. Contract AC06-77RL01030. 256p. NTIS, PC A12/MF A01. Order Number DE82007010.

Portions of document are illegible.

This report was prepared in conjunction with the Basalt Waste Isolation Project in partial fulfillment of requirements to assess the effects of a deep geologic repository for radioactive wastes upon adjacent water resources within the Pasco Basin. Because of the many unanswered questions with respect to repository siting, environmental characterization, engineering design, and other factors related to the proposed facility, it is somewhat premature to present an intensive evaluation of such effects. However, it is considered appropriate at this time to speculate, in a generic fashion, upon the nature of these effects as a basis for future scenario evaluations. Accordingly, this report provides the following: (1) general information and data on the nature of water resources present within the Pasco Basin; (2) a description of present and, to the extent possible, a prediction of future use and trends; (3) speculation with respect to possible interfaces between the repository and adjacent water resources. Background information describes the setting of the Pasco Basin with respect to the physical and socioeconomic resources present. Uses of the water resource, with particular regard to industrial, agricultural, municipal, recreational, and river barging and transportation are described, and a matrix serves to show the existing administrative structure. For the groundwater system, three scenarios were evaluated briefly: importation and application of surface water for irrigation, excessive discharge from wells, and subsidence related to dewatering. In conclusion, it was determined that intrusion into the deeper groundwater systems within the Wanapum Basalt for well development is a foremost consideration with respect to scenarios involving contaminant release to the biosphere.

58181 (PB—82-154261) **Economic impact of implementing volatile organic compound Group II regulations in Ohio. Final report Jun-Dec 81.** Formento, J.W.; Chaudhry, R.; Ploski, T.J.; Klickman, M. (Dames and Moore, Park Ridge, IL (USA)). Dec 1981. 263p. NTIS, PC A12/MF A01.

The major objective of the contract effort was to determine the direct economic impact of implementing Reasonably Available Control Technology (RACT) standards in Ohio. The study is to be used primarily to assist EPA and Ohio decisions on achieving the volatile organic compound (VOC) emission limitations of the RACT standards. The economic impact was assessed for the following eight RACT industrial categories: petroleum refinery fugitive emissions; surface coating of miscellaneous metal parts and products; gasoline tank trucks; synthesized pharmaceutical manufacturing; rubber tire manufacture; graphic arts; petroleum liquid storage in external floating roof tanks; and dry cleaners using perchloroethylene. The scope of this project was to determine the costs and direct impact of control to achieve RACT limitations for these eight VOC industrial categories in Ohio. Direct economic costs and benefits from the implementation of RACT limitations were identified and quantified. While secondary impacts (social, energy, employment, etc.) are addressed, they were not a major emphasis in the study.

This manual covers all documentation and laboratory practices at the Mound Facility. Appendices cover Organizational Chart of Environmental Assessment and Planning Section; Routine Analytical Procedures; Log Books; and Sampling and Analysis Schedule for Radioactivity. (PSB)

58183 (INIS-mf—7092, pp vp) **Nuclear power and protection of waters, forests, soil and atmosphere.** Sarnik, K. (Ministerstvo Lesneho a Vodneho Hospodarstva Slovenskej Socialistickej Republiky, Bratislava (Czechoslovakia)); Mayer, J. (Vyskumny Ustav Vodneho Hospodarstva, Bratislava (Czechoslovakia)). 1979. (In Slovak). NTIS (US Sales Only), PC A09/MF A01.

From Conference on nuclear power and the environment; Zdar nad Sazavou, Czechoslovakia (2 Apr 1979).

The common and the different characteristics of nuclear power plants and fossil-fuel power plants are described. The common characteristic is the heat pollution of the environment by warm waste water. Fine dust, sulphur dioxide and fluorine from conventional power plants seriously damage vegetation, agriculture, forestry, and the population as well. Nuclear power plants are built for maximum safety. The problem of the safety of nuclear power plants which is a very significant one is considered to have been resolved.

58184 (INIS-mf—7092, pp vp) **Radiation hygiene aspects of nuclear power development.** Sevc, J. (Institut Hygieny a Epidemiologie, Prague (Czechoslovakia)). 1979. (In Czech). NTIS (US Sales Only), PC A09/MF A01.

From Conference on nuclear power and the environment; Zdar nad Sazavou, Czechoslovakia (2 Apr 1979).

A comparison is made of the radiation exposure of the population from nuclear power plants and other radiation sources (including medicine) with that from background radiation. The total collective dose equivalent is estimated at 8 Sv per 1000 MWe per year in connection with the whole fuel-energy cycle. Criteria, standards and the system of radiation protection implemented in Czechoslovakia are described. It is estimated that the development of nuclear energy will improve the environment in this country.

58185 (INIS-mf—7092, pp vp) **Ecological evaluation of nuclear power plants.** Brabec, E.; Mejstrik, V. (Ceskoslovenska Akademie Ved, Pruhonice. Ustav Krajinne Ekologie). 1979. (In Czech). NTIS (US Sales Only), PC A09/MF A01.

From Conference on nuclear power and the environment; Zdar nad Sazavou, Czechoslovakia (2 Apr 1979).

The environmental impact is described of a nuclear power plant from the point of contamination by radionuclides and of thermal pollution. Changes in the temperature of water are a serious interference in the water ecosystem while the contamination by radionuclides in fail-free operation of the nuclear power plant is negligible. (J.P.).

5303 Environmental Impact Statements

REFER ALSO TO CITATION(S) 56211

58186 **(NUREG—0854) Final environmental statement related to the operation of Clinton Power Station, Unit No. 1. Docket No. 50-461.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). May 1982. 228p. NTIS11.

Portions of document are illegible.

This final environmental statement contains the second assessment of the environmental impact associated with operation of Clinton Power Station Unit 1 pursuant to the National Environmental Policy Act of 1969 (NEPA) and 10 CFR Part 51, as amended, of the NRC's regulations. This statement examines: the affected environment, environmental consequences and mitigating actions, and environmental and e conomic benefits and costs. Land-use and terrestrial- and aquatic-ecological impacts will be small. Air-quality impacts will also be small. However, steam fog from the station's cooling lake has the potential for reducing visibility over nearby roads and bridges. A fog-monitoring program for roads and ridges near the lake has been recommended. Impacts to historic and prehistoric sites will be negligible. Chemical discharges to Lake Clinton and Salt Creek are expected to have no appreciable impacts on water quality under normal conditions and will be required to meet conditions of the station's NPDES permit. The hydrothermal analyses indicate that under certain meteorological conditions (1-in-50-year drought(, the plant would have to be operated at reduced power levels in order to meet the thermal standards established by the Illinois Pollution Control Board Order PCB 81-82. The effects of routine operations, energy transmission, and periodic maintenance of rights-of-way and transmission line facilties should not jeopardize any populations of endangered or threatened species. No significant impacts are anticipated from normal operational releases of radioactivity. The risk associated with accidental radiation exosure is very low. Contentions associated with accidental radiation exposure is very low. Contentions associated with environmental issues accepted during the operating-license hearing are related to assessment of effects of low-level radiation. The net socioeconomic effects of the project will be beneficial. The action called for is the issuance of an operating license for Unit 1 of Clinton.

55 BIOMEDICAL SCIENCES, BASIC STUDIES

58187 **On structural identification.** Travis, C.C.; Haddock, G. (Oak Ridge Natl Lab, TN). *Mathematical Biosciences;* **56**: No. 3-4, 157-173(Oct 1981).

A problem which constantly recurs when developing mathematical models of biological systems is that some model parameters are unknown. This problem takes on particular significance when the unknown parameters are analogs of biological attributes which are not directly measurable, but are nevertheless of considerable scientific interest. A natural question which arises is whether or not these unknown parameters can be estimated indirectly from observations of the response of the real biological system to certain inputs. A direct method of deciding whether or not the unknown parameters of a dynamical system can be determined uniquely from an input-output experiment is presented. The method relies on the fact that a completely controllable and completely observable system is parameter identifiable if and only if it is not algebraically equivalent to any other system.

5501 Behavioral Biology

58188 **Estimates of hybridization between two species of catostomids in the Columbia River.** Dauble, D.D.; Buschbom, R.L. (Battelle Pacific Northwest Labs., Richland, WA). *Copeia;* No. 4, 802-810(1981).

Extent of hybridization is described between two sympatric catostomids, Catostomus macrocheilus and C. columbianus, from the Hanford Reach of the Columbia River, southeastern Washington state. Estimated percentage of hybrids based on presence of intermediate meristic characters ranged from 12.4 to 14.6% of the total sucker population. Discriminant function analysis reduced subjective variability and lowered estimates of hybridization to 3.0 to 7.1%. Principal component analysis also provided evidence that the suspected hybrids were intermediate between populations of C. macrocheilus and C. columbianus. Meristic characters contributed most to all methods of treatment, with number of lateral line scales the best single criterion for species separation. Any analysis of closely related species would benefit from examination of offspring from artificial crosses and from knowledge of allopatric population characteristics. Breakdown of isolating mechanisms leading to C. macrocheilus X C. columbianus crosses may result from overlap in spawning time and incomplete habitat segregation. Morphological and coloration differences at spawning may provide a basis for species recognition, thus providing some degree of ethological isolation.

58189 **Eigenvalues of a deterministic neural net.** Gibbs, W.R. (Los Alamos National Lab., NM). *Mathematical Biosciences;* **57**: 19-34(1981).

A topological description of the logical connectivity of the deterministic limit of a neural net is related to the eigenvalues of the Markov matrix that describes its evolution in time. A specific relation is shown between these eigenvalues and memory retention. A simple concrete example illustrates how information may be stored and retrieved with this mechanism. The fundamental symmetries of the system are discussed in the context of the present limit.

Portions of document are illegible.

Reagents were developed which bind covalently to side chains of kallikrein, thereby inactivating the enzyme. Both temporary and irreversible inhibitors have been synthesized. (ACR)

58191 **(EUR—7683-EN) Investigation of the properties of the primary electron-acceptor complex of photosystem I. Final report.** Evans, M.C.W.; Heathcote, P.; Nugent, J. (University Coll., London (UK)). 1982. 59p. Commission of the European Communities, Directorate-General for Information Market and Innovation, Jean Monnet Building, Luxembourg.

This paper describes work on the mechanism of photosystem I, in particular, with the composition of the electron acceptor system. A procedure was developed for large-scale isolation of chloroplasts from chlorophyll molecules. The purity of the particles competes with any reported preparation and stability is maintained for one week or longer. (PSB)

58192 **(SAND—82-1831C) Feasibility of imaging unstained DNA by field-ion tomography.** Panitz, J.A. (Sandia National Labs., Albuquerque, NM (USA)). 1982. Contract AC04-76DP00789. 7p. (CONF-820841—1). NTIS, PC A02/MF A01. Order Number DE82019481.

From 29. international field emission symposium; Goteborg, Sweden (9 Aug 1982).

A high field imaging technique has been described which can be used to obtain contour slice images of unstained macromolecules placed on the apex of a field-emitter tip. From a series of contour slice images, a three-dimensional reconstruction of molecule morphology can be obtained. This technique is called Field-Ion Tomography. Unlike Computer Assisted Tomography, Field-Ion Tomography can only be used to reconstruct exterior morphology. In order to apply field-ion techniques, an object must be placed on the apex of a field-emitter tip within an area close to the tip axis. Using an aqueous deposition procedure to place biomolecules within the area of the tip apex, reproducible, submonolayer coverages of ferritin were obtained. Although the procedure developed for ferritin can be used to place other biomolecules on to field-emitter tips, the procedure is difficult to apply unless there is an ample supply of the molecule of interest. In order to work with DNA, it was necessary to scale down the dosing parameters. To this end, a new dosing procedure was developed which requires only 10 λ of sample at a concentration of ≅ 5 μg/ml. (ERB)

58193 **Lymphocyte, monocyte, and granulocyte proteins compared by use of two-dimensional electrophoresis.** Gemmell, M.A.; Anderson, N.L. (Argonne National Lab., IL). *Clinical Chemistry (Winston-Salem, North Carolina);* **28**: No. 4, 1062-1066(Apr 1982). Contract W-31-109-ENG-38.

Cellular proteins were compared from normal human blood lymphocytes, monocytes, and granulocytes, using high-resolution two-dimensional electrophoresis. The leukocytes were isolated from peripheral blood by centrifugation on density step gradients (yielding a fraction of purified granulocytes and a lymphocyte/monocyte mixture) and monocytes were subsequently separated from lymphocytes by virtue of their adherence to plastic. The cells were labeled with [^{35}S]-methionine after various intervals in culture, then solubilized and analyzed by two-dimensional electrophoresis. Although most proteins in each cell type are common to all three, there are nevertheless several specific marker proteins that distinguish one cell type from another. We also examined the appearance of these markers in three lines of cultured cells from humans (GM607, a B-lymphoblastoid line; HL-60, a promyelocytic leukemic line; and 1494, a normal skin fibroblast).

58194 **Two-dimensional electrophoretic analysis of the heat-shock-induced proteins of human cells.** Anderson, N.L.; Giometti, C.S.; Gemmell, M.A.; Nance, S.L.; Anderson, N.G. (Argonne National Lab., IL). *Clinical Chemistry (Winston-Salem, North Carolina);* **28**: No. 4, 1084-1092(Apr 1982). Contract W-31-109-ENG-38.

Using two-dimensional electrophoresis, the responses of human cells in culture to heat shock have been investigated. These treatments result in the induction of increased synthesis of several specific proteins. One (HShock:1, SDS-molecular mass about 65 000) is increased by about 350-fold over the amount in untreated cells. Computer analysis of time-course studies indicates, however, that rates of synthesis of various proteins other than the classical heat shock proteins are affected, some of these alterations following time courses quite different from the main (HShock) inductions. The heat shock effect is thus much more complicated than previously realized. We purified the HShock:1 protein from heat-shocked human lymphoblastoid cells, and prepared a rabbit antiserum specific for HShock:1 on nitrocellulose two-dimensional gel transfers of total lymphoblastoid cell protein. A survey of mouse tissues shows high concentration of an HShock:1-like protein in the testis, and human testes also appears to contain substantial (though lower) concentrations. Using the antiHShock:1 antibody in an immunoassay, it will be possible to systematically examine HShock:1 concentrations in plasma and leukocytes, thereby opening up the possibility of a clinical test based for the first time upon an inducible aspect of cellular gene expression.

58195 **Proteins of human urine. III. Identification and two-dimensional electrophoretic map positions of some major urinary proteins.** Edwards, J.J.; Tollaksen, S.L.; Anderson, N.G. (Argonne National Lab., IL). *Clinical Chemistry (Winston-Salem, North Carolina);* **28**: No. 4, 941-948(Apr 1982). Contract W-31-109-ENG-38.

The proteins of human urine have been mapped by high-resolution two-dimensional electrophoresis, utilizing the ISO-DALT system. Wide-range pH gradients and narrow-range acid gradients were both used in the first-dimension separations. The patterns revealed proteins ranging in relative molecular mass from 10 000 to 90 000. Proteins identified in the map included transferrin, albumin, hemopexin, α_2-HS glycoprotein, α_1-antitrypsin, Gc globulin, α_1-acid glycoprotein, Zn α_2-glycoprotein, retinol binding protein, β_2-microglobulin, the immunoglobulin light chains, and MAUP (most acid urinary protein). The use and utility of internal-charge and molecular-mass standards are described. We used electrophoretic transfer of proteins to nitrocellulose sheets and subsequent detection by immunological methods to identify some proteins.

58196 **Two-dimensional analysis of human lymphocyte proteins. III. Preliminary report on a marker for the early detection and diagnosis of infectious mononucleosis.** Willard, K.E. (Argonne National Lab., IL). *Clinical Chemistry (Winston-Salem, North Carolina);* **28**: No. 4, 1031-1035(Apr 1982).

Two-dimensional gel electrophoretic patterns of human peripheral blood leukocytes from 12 patients with infectious mononucleosis were prepared by use of the ISO-DALT system. Before the two-dimensional separation, the leukocytes were purified by Ficoll-Paque gradient centrifugation and labeled overnight with [^{35}S] methionine. Quantitative increases in two proteins were detected in the patterns of infected leukocytes from the patients as compared with controls. Fluorescence-activated cell sorting of leukocytes from normal human peripheral blood before subsequent two-dimensional gel analysis revealed that the dramatic increase in one of these proteins (Inmono:2) could be due to shifts in the population ratios of lymphocytes, monocytes, and granulocytes. In contrast, the appearance in the infected leukocytes of a second protein, Inmono:1, could not be accounted for by cell-population shifts. Increased amounts of these two proteins have been found in every patient studied who had clinically detectable infectious mononucleosis. In addition, a patient who displayed symptoms of infectious mononucleosis but who did not have a positive result in the MONOSPOT test (Ortho) until three weeks after our analysis also demonstrated increased relative amounts of these proteins in his leukocyte pattern.

58197 **Two-dimensional analysis of human lymphocyte proteins. II. Regulation of lymphocyte proteins by a molecule present in normal human urine.** Willard, K.E. (Argonne National Lab., IL). *Clinical Chemistry (Winston-Salem, North Carolina);* **28**: No. 4, 1074-1083(Apr 1982). Contract W-31-109-ENG-38.

Lymphocytes cultured with concentrated human urine develop many alterations. New proteins appear (Urocon proteins), while others disappear (Urocof proteins) from the two-dimensional gel pattern. This paper characterizes a human urinary leukocyte effector protein (HULEP) that is responsible for the appearance of the Urocon:11-15 proteins in human lymphocytes. The effector molecule, HULEP-1, is a protein with a relative molecular mass in the range of 29 000 to 43 000. Urocon:11-15 production, cytoskeletal changes in the lymphocyte, and the presence of added HULEP-

1 in the cultures are all directly related. This molecule appears to alter the structure of the lymphocyte by degrading actin and possibly other lymphocyte cytoskeletal proteins. Peptide maps of Urocon:11-15 and β and γ actin provide evidence that Urocon:11-15 proteins are closely related to nonmuscle actin, and may be degradation products of this major cytoskeletal protein.

58198 Two-dimensional electrophoretic analysis of human leukocyte proteins from patients with rheumatoid arthritis. Willard, K.E. (Argonne National Lab., IL); Thorsrud, A.K.; Munthe, E.; Jellum, E. *Clinical Chemistry (Winston-Salem, North Carolina);* **28**: No. 4, 1067-1073(Apr 1982). Contract W-31-109-ENG-38.

Human leukocyte proteins from more than 150 patients with rheumatoid arthritis, together with age- and sex-matched controls, were analyzed by use of the ISO-DALT technique of two-dimensional polyacrylamide gel electrophoresis. Patients with ankylosing spondylitis, polymyalgia rheumatica, psoriatic arthritis, calcium tendinitis, post-infectious arthritis, and asymmetrical seronegative arthritis were also included as positive controls. Synthesis of several proteins, referred to by number as members of the Rheuma set, is shown to increase in the leukocyte preparations from patients with classical rheumatoid arthritis. Several of these proteins are specific to monocytes or granulocytes; others are of unknown cellular origin, but appear to be unique to rheumatoid arthritis. The Rheuma proteins appear to be indicators of disease activity, because their increased synthesis can be correlated with sedimentation rate and other clinical indices of rheumatoid disease activity.

58199 Cytoskeletal proteins from human skin fibroblasts, peripheral blood leukocytes, and a lymphoblastoid cell line compared by two-dimensional gel electrophoresis. Giometti, C.S.; Willard, K.E.; Anderson, N.L. (Argonne National Lab., IL). *Clinical Chemistry (Winston-Salem, North Carolina);* **28**: No. 4, 955-961(Apr 1982). Contract W-31-109-ENG-38.

Differences in proteins between cells grown as suspension cultures and those grown as attached cultures were studied by comparing the proteins of detergent-resistant cytoskeletons prepared from peripheral blood leukocytes and a lymphoblastoid cell line (GM607) (both grown as suspension cultures) and those of human skin fibroblasts (grown as attached cultures) by two-dimensional gel electrophoresis. The major cytoskeletal proteins of the leukocytes were also present in the protein pattern of GM607 cytoskeletons. In contrast, the fibroblast cytoskeletal protein pattern contained four groups of proteins that differed from the patterns of the leukocytes and GM607. In addition, surface labeling of GM607 and human fibroblasts with ^{125}I demonstrated that substantial amounts of vimentin and actin are exposed at the surface of the attached fibroblasts, but there is little evidence of similar exposure at the surface of the suspension-grown GM607. These results demonstrate some differences in cytoskeletal protein composition between different types of cells could be related to their ability or lack of ability to grow as attached cells in tissue culture.

58200 Proteins of human milk. I. Identification of major components. Anderson, N.G.; Powers, M.T.; Tollaksen, S.L. (Argonne National Lab., IL). *Clinical Chemistry (Winston-Salem, North Carolina);* **28**: No. 4, 1045-1055(Apr 1982). Contract W-31-109-ENG-38.

Traditionally, human milk proteins are identified largely by reference to bovine milk. Hence, to identify the major proteins in human milk, we subjected human and bovine milk, in parallel, to high-resolution two-dimensional electrophoresis. Isoelectric precipitation at pH 4.6 was our criterion for distinguishing whey proteins from those of the casein complex. The α- andβ-caseins were identified on the basis of relative abundance, relative molecular mass, and relative isoelectric points. No protein disappeared from ISO-DALT patterns of human milk after rennin treatment, and no new protein comparable to bovine para K-casein appeared in the BASO-DALT patterns; this suggests that K-casein is absent from human milk. The proteins identified in human milk patterns include the α and β casein families, lactalbumin, albumin, transferrin, IgA, and lactoferrin. Numerous additional proteins seen in patterns for human milk remain to be identified.

58201 Laser-Raman spectrum of a Davydov soliton. Scott, A.C. (Los Alamos National Lab., NM). *Physics Letters [Section] A;* **86**: No. 1, 60-62(26 Oct 1981).

It is suggested that the laser-Raman spectra between 30 and 300 cm^{-1}, which have recently been observed on metabolically active cells, may reflect the internal vibrations of Davydov solitons.

58202 Ascorbate induction of collagen synthesis as a means for elucidating a mechanism for quantitative control of tissue-specific function. Swartz, R.I.; Mandell, R.B.; Bissell, M.J. (Lawrence Berkeley Lab., CA). *Molecular and Cellular Biology;* **1**: No. 9, 843-853(Sep 1981). Contract W-7405-ENG-48.

Ascorbic acid displays the characteristics of an ideal inducer of tissue-specific function in primary avian tendon cells in culture. It is a highly specific, potent stimulator of collagen synthesis, it demonstrates slow reversible kinetics, and it has no effect on growth rate of the cultured cells. Kinetic analysis of ascorbate induction of collegen synthesis was used to determine the critical steps in this complex biosynthetic pathway. Full hydroxylation of the proline residues in collagen, although probably a necessary step for collagen induction, was in itself not sufficient for achieving either increased secretion or increased synthesis. On the other hand, an increase in secretion rate, which required both the presence of ascorbate and a high cell density, did correlate with the later stimulation in procollagen production. The process of procollagen secretion, therefore, meets the minimal requirements for the rate-limiting step. The fact that the cells maintained a large pool of intracellular procollagen despite changes in the rates of translation or secretion led us to postulate a possible feedback between the level of the internal procollagen pool and the rate of procollagen synthesis.

58203 Inhibition of /beta/-glucosidase activity in Trichoderma reesei C30 cellulase by derivatives and isomers of glucose. Woodward, J.; Arnold, S.L. (Oak Ridge Natl Lab, TN). *Biotechnology and Bioengineering;* **23**: No. 7, 1553-1562(Jul 1981).

The inhibition of /beta/-glucosidase in Trichoderma reesei C30 cellulase by D-glucose, its isomers, and derivatives was studied using cellobiose and p-nitrophenyl-/beta/-glucoside as substrates for determining enzyme activity. The enzymatic hydrolysis of both substrates was inhibited competitively by glucose. This inhibition by glucose was maximal at pH 4.8 and no inhibition was observed at pH 6.5 and above. The /alpha/anomer of glucose inhibited /beta/-glucosidase to a greater extent than did the /beta/form. Compared with D-glucose, L-glucose, D-glucose-6-phosphate, and D-glucose-1-phosphate inhibited the enzyme to a much lesser extent, unlike D-glucose-L-cysteine which was almost as inhibitory as glucose itself when cellobiose was used as substrate. Fructose (2-100mM) was found to be a poor inhibitor of the enzyme. It is suggested that high rates of cellobiose hydrolysis catalyzed by /beta/-glucosidase may be prolonged by converting the reaction product glucose to fructose using a suitable preparation of glucose isomerase. 20 refs.

58204 Peptidyl chloromethyl ketones and diazomethyl ketones as protease affinity labels. Shaw, E.; Kettner, C.; Green, G.D.J. (Brookhaven National Lab., Upton, NY). pp 401-409 of PEPTIDES: synthesis - structure - function. Rich, D.H.; Gross, E. (eds.). Madison, WI; Pierce Chemical Company (1981).

From 7. annual peptide symposium; Madison, WI, USA (15 Jun 1981).

Concerns with the mechanism of action of proteases led to the development of affinity labeling reagents. The conversion of a substrate carboxyl group to a bromo- or chloromethyl ketone group led to a new class of inactivators or serine proteases, which act in part like substrates forming initially a reversible complex with the protease. Within the complex an active center histidine residue normally positioned near the carboxyl group of the substrate to take part in proton transfer steps associated with catalysis becomes alkylated instead by the chloromethyl ketone. Serine proteases are subdivided according to substrate specificity and it became evident that, although all serine proteases have an active center histidine, chloromethyl ketone derivatives of amino acids or peptides inactivate only the serine protease whose specificity is satisfied. The possibility that affinity labeling reagents might be made so selective that they could provide new classes of therapeutic reagents was appreciated early in the application of this type of chemical modification to a variety of enzymes.

58207 **Genetic variation for prolidase (PEP-4) in the mouse maps near the gene for glucosephosphate isomerase (GPI-1) on chromosome 7.** Skow, L.C. (Oak Ridge National Lab., TN). *Boletin del Instituto Gemologico Espanol;* **19**: No. 7/8, 695-700(1981). Contract W-7405-ENG-26.

An inherited electrophoretic variant of prolidase (EC 3.4.13.9), also called peptidase 4 (PED-4), has been discovered among inbred strains of mice. Analysis of progeny from reciprocal backcrosses established that the electrophoretic forms are expressed codominantly and that Pep-4 is located between the genes for glucosephosphate isomerase (Gpi-1) and pink-eyed dilution (p) on chromosome 7. These data define a region of conserved gene linkage between mouse chromosome 7 and human chromosome 19, as originally indicated by somatic cell hybrid studies, and imply that human prolidase (PEPD) is located in the region of human chromosome 19 pter → q13.

58208 **Nucleotide modification of tRNA in the yeast Saccharomyces cerevisiae is not affected by the psi factor which modulates suppression efficiency.** Colby, D. (Univ. of California, San Francisco); Sherman, F. *Current Genetics;* **3**: 163-165(1981).

We have examined the tRNAs of two related strains of Saccharomyces cerevisiae, Psi^+ and Psi^-, which differ with respect to an extrachromosomal genetic element that modulates the expression of genotypic and phenotypic suppression. Both the pattern of tRNAs synthesized and the level of nucleotide modificaion of several selected tRNA species were found to be the same in the Psi^+ and Psi^- strains.

58209 (DOE/ER/10984—6, pp 185-246) **Biomedical research applications of electromagnetically separated enriched stable isotopes.** Lambrecht, R.M. (Brookhaven National Lab., Upton, NY). 1982. NTIS, PC A13/MF A01. Contract FG01-81ER10984.

In Separated isotopes: vital tools for science and medicine.

The current and projected annual requirements through 1985 for stable isotopes enriched by electromagnetic separation methods were reviewed for applications in various types of biomedical research: (1) medical radiosotope production, labeled compounds, and potential radiopharmaceuticals; (2) nutrition, food science, and pharmacology; (3) metallobiochemistry and environmental toxicology; (4) nuclear magnetic resonance, electron paramagnetic resonance, and Moessbauer spectroscopy in biochemical, biophysical, and biomedical research; and (5) miscellaneous advances in radioactive and non-radioactive tracer technology. Radioisotopes available from commercial sources or routinely used in clinical nuclear medicine were excluded. Priorities and summaries are based on statements in the references and from answers to a survey conducted in the fall of 1981. Current requirements for enriched stable isotopes in biomedical research are not being satisfied. Severe shortages exist for ^{26}Mg, ^{43}Ca, ^{70}Zn, ^{76}Se, ^{78}Se, ^{102}Pd, ^{111}Cd, ^{113}Cd, and ^{190}Os. Many interesting and potentially important investigations in biomedical research require small quantities of specific elements at high isotopic enrichments.

58210 (DOE/ER/10984—6, pp 247-268) **Workshop on clinical applications of stable isotopes and derived radioisotopes.** Reba, R.C. 1982. NTIS, PC A13/MF A01. Contract FG01-81ER10984.

In Separated isotopes: vital tools for science and medicine.

The importance of the stable isotope program for the practice of clinical nuclear medicine is summarized. The author observes that medical insurors are becoming more adamant that innovative and noninvasive procedures benefit the patient in actuality and not just to advance nuclear medicine. (PSB)

58211 (DOE/EV/04533—1) **Efficacy of clinical diagnostic procedures utilized in nuclear medicine. Technical progress report, 1 December 1981-30 November 1982.** Saenger, E.L. (Cincinnati Univ., OH (USA)). Jul 1982. Contract AC02-77EV04533. 53p. NTIS, PC A02/MF A01. Order Number DE82019932.

Portions of document are illegible.

The efficacy of nuclear medicine diagnostic procedures was measured. Three levels of efficacy were defined. However, two different methods of evaluating efficacy itself were first compared. Using two methods, logistic regression and entropy-minimax pattern detection, substantial agreement was found between them in several clinical observations. (1) There are no attributes that indicate that any grouping of symptoms, signs, and laboratory findings is capable of suggesting that a patient does or does not have a pulmonary embolus. (2) The lung scan test is the only reliable method which indicates that a patient may have a pulmonary embolus or does not have a pulmonary embolus. (3) The validity of these conclusions and the ability to apply them widely to ongoing clinical practice is based on the prospective design of the Study which included an appropriate distribution of institutions by type, size, and geographic location. Also, the only judgement samples was that of the referring physician. (ERB)

58212 (HRP—0903872/0) **Task force report on computerized tomographic scanners.** (Bergen-Passaic Health Systems Agency, Hackensack, NJ (USA)). Oct 1978. 325p. NTIS, PC A14/MF A01.

Computerized axial tomography (CAT) scanning was the focus of a task force established by the Bergen-Passaic Health Systems Agency in New Jersey. The task force reviewed the literature on CAT technology and its applications, surveyed four northeastern hospitals with operating CAT scanning installations, and created three working subcommittees which produced written reports. It was agreed by task force members that certain criteria should be used when evaluating applications for CAT scanners, e.g., service area, staff resources, emergency room activity, radiotherapy, 24-hour scanner coverage, the medically indigent, and cost. Overall, it was determined that CAT is a proven diagnostic tool of significant value and that it should be available to residents of the Bergen-Passaic health service area. Since the CAT field is rapidly evolving and changing, however, it was not possible to define quantitatively the long-term need for and supply of CAT scanners in the region. Appendixes present supporting data on the task force findings.

58213 **(HRP—0903938/9) Therapeutic radiology services in central Viginia 1981: appropriateness review findings.** (Central Virginia Helath Systems Agency, Inc., Richmond (USA)). Jul 1981. 18p. NTIS, PC A02/MF A01.

The Central Virginia Health Systems Agency (CVHSA) has developed and implemented specific criteria and standards for Therapeutic Radiology Services. The criteria address the availability, accessibility, and cost of the services, and the quality, continuity, and acceptability of the care provided. The data and information utilized in this review were obtained primarily from a specific Appropriateness Review survey instrument which was utilized by all of the HSA's in Virginia. The three institutional providers of megavoltage radiation therapy in HSA IV comply with the majority of CVHSA criteria and standards pertaining to availability, accessibility, and cost of services. Despite the fact that the Cobalt 60 unit at the McGuire Clinic provided treatment to less than 300 new patients during 1980, available evidence suggests that utilization of this unit will continue to grow during the next five years. Existing megavoltage units in HSA IV should be sufficient to absorb the total demand for radiation therapy services through 1985. The institutional providers of megavoltage radiation therapy comply with the majority of CVHSA criteria and standards pertaining to quality, continuity, and acceptability of care.

58214 **(HRP—0904057/7) Task force report on computed tomography.** (Health Systems Agency of Southwestern Pennsylvania, Inc., Pittsburgh (USA)). 28 Jul 1981. 33p. NTIS, PC A03/MF A01.

The relatively new radiological device of computed tomography is explained, and attention is directed to planning efforts for this service. The report was prepared to best reflect the intent and recommendations of the Task Force of the Southwestern Pennsylvania Health Systems Agency. The qualitative guidelines for the Computerized Tomographic (CT) Scanner cover the following: general facility considerations; general equipment considerations; regionalized programs; staffing and programs; types of CT technology; coordination and communication; and general planning considerations. The reported utilization of scanners in the region were reviewed, and technical reports on the capabilities of CT scanners were evaluated. An appendix presents an international classification of diseases which might indicate a need for scanning.

58215 **(HRP—0904070/0) Computed tomography (CT) scanning in mid-Michigan, 1981.** (Central Michigan Medical Care Review, Inc., East Lansing (USA)). 1981. 278p. NTIS, PC A13/MF A01.

During February and March 1981, data on computed tomography (CT) utilization was collected from hospitals, referring physicians, and CT facilities in the Lansing, Michigan, area. Regional need was projected using both population-based and Leonard methodologies. Both projections fall within 10 percent of actual head scan utilization, but body scan utilization is only 50 percent of the lower projection. Sixty-one percent of scans were performed on outpatients, and 50 percent of the inpatients receiving scans required transportation to another facility. The financial break-even level for the two area scanners is approximately 2,000 visits annually per scanner. Both scanners were maintaining a positive net present value. Further evaluation of the medical appropriateness of CT scans and an update of the screening criteria are recommended. Reimbursement policies for CT scanning should be evaluated, education sessions on appropriate CT use should be conducted, and in-depth reviews of selected types of CT orders should be performed. Appendices include survey instruments; indications and criteria for CT head and body scanning; sample protocols; the Leonard methodology; the CT planning policies of the Michigan Department of Public Health; and comments on net present value analysis. A bibliography, glossary, tables, and figures are included.

58216 **(PNL—4311) Microbial colonization of retorted shale in field and laboratory studies.** Rogers, J.E.; McNair, V.M.; Li, S.W.; Garland, T.R.; Wildung, R.E. (Pacific Northwest Lab., Richland, WA (USA)). Aug 1982. Contract AC06-76RL01830. 26p. NTIS, PC A03/MF A01. Order Number DE82020363.

The microbial colonization of retorted shale was measured in field lysimeters and laboratory with retorted shale obtained from an above-ground retort operating in the direct heating mode. In field lysimeter studies, total aerobic heterotrophic bacterial colony forming units (cfu), as measured by a selective plating medium in surface horizons of retorted shale and adjacent soils, were similar (3.3×10^6 and 2.7×10^6 bacterial cfu/g dry weight) two months after disposal. However, unlike the soil that exhibited a diverse community, the retorted shale was dominated by a single Micrococcus species that composed 30% of the total bacterial community. After one and two years, the total aerobic heterotrophic bacterial cfu in the retorted shale and soil were again similar; however, no bacterium dominated either community. A core sample from the field lysimeter indicated microbial colonization to a depth of 150 cm after one year. An increased ratio of anaerobic to aerobic heterotrophic bacterial cfu in the deepest sample (120 to 150 cm) implied the development of anaerobic conditions. In the laboratory, aerobic heterotrophic bacteria were shown capable of using, as the sole source of carbon, retorted shale in liquid cultures. Of the added nutritional amendments, PO_4^{-3}, NO_3^- and SO_4^{-2}, only phosphate markedly altered the colonization of retorted shale in liquid culture; shortening the lag phase of colonization from less than three to seven weeks to less than one week and leading to a greater aerobic heterotrophic population over the incubation interval. The addition of phosphate also led to a aerobic heterotrophic bacterial community composed entirely of Micrococcus species.

58217 **Characterization of Fv-1 gene-product-mediated resistance transfer.** Rascati, R.J.; Otten, J.A.; Brown, A.; Hannan, J.E.; Yang, W.K.; Tennant, R.W. (Oak Ridge National Lab., TN). *Intervirology;* **15**: 87-96(1981). Contract W-7405-ENG-26.

Fv-1 gene-specific resistance to ecotropic murine retroviruses can be transferred to permissive cells with RNA prepared from restrictive cells. The active RNA has a sedimentation coefficient of 20-22S at low ionic strength and multiple regions of activity (5-6S, 10-12S, 24-27S) at high ionic strength. The maximum level of resistance transfer cannot be enhanced with noninhibitory carrier RNA or facilitators of RNA uptake, and the maximum inhibition (40-60%) is independent of the MOI. The low efficiency of resistance transfer is, therefore, probably the result of a fraction of cells resistant to RNA uptake.

58218 **Some aspects of thermophilic and extreme thermophilic anaerobic microorganisms.** Ljungdahl, L.G.; Bryant, F.; Carreira, L.; Saiki, T.; Wiegel, J. (Univ. of Georgia, Athens). pp 397-419 of Trends in the biology of fermentations for fuels and chemicals. Hollaender, A.; Rabson, R. (eds.). New York, NY; Plenum Publishing Corporation (1981). Contract AS09-79ER10499.

In this presentation, researchers have discussed that the acetogenic thermophilic bacterium, Clostridium thermoaceticum, ferments glucose almost quantitatively to acetate. That part of the acetate is formed from CO_2, which functions as the electron sink. Researchers have demonstrated that enzymes in the acetate formation contain trace elements such as iron, cobalt, nickel, selenium and tungsten. Furthermore, researchers have indicated that this bacterium must have an electron transport system, which is not yet completely understood. With Clostridium thermohydrosulfuricum results have been obtained which indicate that this thermophile may selectively produce proteins dependent on the environmental temperature. Researchers have presented a new bacterium, Thermoanaerobacter ethanolicus, which ferments several sugars including starch, cellobiose, and xylose to ethanol. The existence in a thermal environment of anaerobic bacteria that grow at temperatures of around 90°C and which are capable of fermenting diverse substrates such as lactate, glucose, and cellulose, have been demonstrated.

5508 Morphology

58219 **(UCD—472-504) Nasal airway anatomy and inhalation deposition in experimental animals and people.** Schreider, J.P. (California Univ., Davis (USA). Lab. for Energy-Related Health Research). Sum 1982. Contract AC03-76SF00472. 29p. NTIS, PC A03/MF A01. Order Number DE82020262.

The anatomical characteristics of the nasal cavities of various experimental animals and man have been presented along with particle deposition considerations. There are a number of differences and similarities between the species. Perhaps one of the most obvious examples of anatomical differences is in the structure of the turbinate regions. Some of the differences could affect deposition of various sized particles in the nasal cavities. A degree of caution, therefore, has to be exercised in extrapolating the nasal deposition characteristics from one species to another. Simple scaling calculations may not be sufficient.

58220 **(DOE/EV/03264—21) Inborn anemias in mice. Comprehensive progress report, 1 August 1979-1 June 1982, to accompany twenty-seventh renewal proposal.** Bernstein, S.E.; Russell, E.S.; Barker, J.E. (Jackson Lab., Bar Harbor, ME (USA)). 1 Jul 1982. Contract AC02-76EV03264. 71p. NTIS, PC A04/MF A01. Order Number DE82019273.

Portions of document are illegible.

Hereditary anemias of mice have been investigated including four macrocytic anemias, three hemolytic anemias, nonhemolytic microcytic anemia, transitory siderocytic anemia, sex-linked iron-transport anemia, an α-thalassemia, and a new target-cell anemia. Each of these blood dyscrasias is caused by the action of a unique mutant gene, which determines the structure of different intracellular molecules controlling a different metabolic process. Thus the wide range of different hereditary anemias has considerable potential for uncovering many different aspects of hemopoietic homeostatic mechanisms in the mouse and by extension to man from an understanding of mammalian mechanisms utilized in the control of erythropoiesis. Each of the different anemias is studied through: (a) biochemical and biophysical characterization of peripheral blood cells; (b) determinations of cellular and organismic radiosensitivity under a variety of conditions; (c) measurements of iron metabolism and heme biosynthesis; (d) morphological and biochemical study of blood-forming tissue; (e) functional tests of the stem cell component; (f) examination of responses to erythroid stimuli and inhibitors; and (g) physiological complementation analysis via transplantation of tissue between individuals of differently affected genotypes.

58221 **(DOE/EV/10360—3) Correlation of chromosome patterns in human leukemic cells with exposure to chemicals and/or radiation. Comprehensive progress report, January 1, 1980-December 31, 1982.** Rowley, J.D. (Chicago Univ., IL (USA)). Jun 1982. Contract AC02-80EV10360. 24p. NTIS, PC A02/MF A01. Order Number DE82019266.

Portions of document are illegible.

The observations that two particular translocations are consistently associated with specific differentiation stages of acute nonlymphocytic leukemia were confirmed. These are the translocation between chromosomes 8 and 21 in acute myeloblastic leukemia with maturation and the translocation between chromosomes 15 and 17 in acute promyelocytic leukemia. The observation of others that structural rearrangements involving the long arm of No. 11 are frequently seen in acute monoblastic leukemia was also confirmed. The chromosome aberrations that are observed in the great majority of patients with acute leukemia secondary to cytotoxic therapy were defined. Thus of 47 patients with secondary acute nonlymphocytic leukemia, an aneuploid clone was seen in 44, and 39 of the 44 had a loss of part or all of No. 5 and/or No. 7. I have been able to localize the region of chromosome No. 7, loss of which is important for the development of leukemia was localized. Patients with ANLL de novo whose occupational histories suggest exposure to potentially mutagenic agents have a higher frequency of aberrations involving Nos. 5 and/or 7, than do patients not so exposed. Thus 50% of exposed versus 10% of nonexposed patients had aberrations of Nos. 5 or 7.

58222 **(BNL—31593) Humoral regulation of erythropoiesis.** Miller, M.E.; Garcia, J.F.; Shiue, G.G.; Okula, R.M. (Brookhaven National Lab., Upton, NY (USA); Lawrence Berkeley Lab., CA (USA)). 1982. Contract AC02-76CH00016. 18p. (CONF-8206107—2). NTIS, PC A02/MF A01. Order Number DE82020033.

From 18. Alfred Benzon symposium - haemopoietic stem cells; Copenhagen, Denmark (13 Jun 1982).

The role of erythropoietin (Ep) in the regulation of erythropoiesis has been defined previously. Other regulators of erythropoiesis termed burst promoting factors also influence erythropoiesis in vitro but their in vivo regulatory activity remains to be proven. The newly developed radioimmunoassay (RIA) for Ep has been used to measure levels of immunoreactive Ep in rats subjected to either graded amounts of blood loss or alterations in the affinity of the hemoglobin molecule for oxygen. An attempt is made to define two unresolved areas in erythropoiesis, viz., the influence of the p 50 (pO_2 at which 50% of the hemoglobin molecule is saturated with O_2) and the effect of relatively small increments in Ep on in vivo erythropoiesis.

58223 **(DOE/EV/03139—47) Embryo culture in teratological surveillance and serum proteins in development. Comprehensive fourteen year report, 1968-1982.** Klein, N.W. (Connecticut Univ., Storrs (USA). Dept. of Animal Genetics). Jul 1982. Contract AC02-76EV03139. 34p. (COO—3139-47). NTIS, PC A03/MF A01. Order Number DE82020442.

A testing procedure is being developed which may reduce the incidence of birth defects. The procedure uses in vitro cultures of whole rat embryos. Early studies on the nutrition of embryos involved attempts to culture whole chick embryos on protein-free chemically defined media. Media containing proteins from whole egg were superior. No single protein would support growth and development, at least two proteins were required. One protein was a transferrin, the second protein could be either ovalbumin or lipovitellin. To determine the path taken by nutrient proteins from medium to embryo, radioactive ovalbumin was prepared. The results showed that intact ovalbumin was taken up by the extra-embryonic yolk-sac and degraded to constituent amino acids within this structure. This observation was difficult to reconcile with the observed responses of the embryo to nutrient proteins. Consideration was given to yolk-sac function. When isolated yolk-sacs were incubated in Ringer's salt solution, they synthesized and secreted a distinct group of proteins. Yolk-sacs cultured on media containing various protein constituents synthesized serum proteins in relative amounts that were distinct for each medium. This suggested that the embryo responses to various culture media were mediated by changes in the relative synthesis of serum proteins. This hypothesis led to two lines of experimentation: what are the mechanisms regulating the relative synthesis of serum proteins by the yolk-sac; and do serum proteins actually provide signals of developmental significance. The first question led to studies with cultures of endodermal cells while the second question led to work on the development of a test for teratological surveillance. (ERB)

58224 **Corneal-shaping electrode.** Doss, J.D.; Hutson, R.L. (to Department Of Energy). US Patent 4,326,529. 27 Apr 1982. Filed date 5 Dec 1979. vp.

PAT-APPL-100664.

The disclosure relates to a circulating saline electrode for changing corneal shape in eyes. The electrode comprises a tubular nonconductive electrode housing having an annular expanded base which has a surface substantially matched to a subject corneal surface. A tubular conductive electrode connected to a radiofrequency generating source is disposed within the electrode housing and longitudinally aligned therewith. The electrode has a generally hemispherical head having at least one orifice. Saline solution is circulated through the apparatus and over the cornea to cool the corneal surface while radiofrequency electric current emitted from the electrode flows therefrom through the cornea to a second electrode, on the rear of the head. This current heats the deep corneal stroma and thereby effects corneal reshaping as a biological response to the heat.

58225 (ORNL/TM—8335) **Whole-tree harvesting: nutrient depletion estimates and post-harvest impacts on nutrient dynamics. Third year progress report for 1981.** West, D.C.; Mann, L.K. (Oak Ridge National Lab., TN (USA)). Sep 1982. Contract W-7405-ENG-26. 127p. NTIS, PC A07/MF A01. Order Number DE82010460.

Scientists at Oak Ridge National Laboratory are coordinating investigations on the environmental effects of residue removal and whole-tree utilization for several forest types in the United States. Sites were selected to include central hardwoods, northern hardwood, northern coniferous, southern appalachian oak-hickory, northwestern coniferous, and southern pine forests. All sites have been established at locations having a long history of biomass and nutrient cycling research to provide a foundation of data to assess the effects of whole-tree harvest on erosion, nutrients, water quality, and productivity. This report (the third in a series) describes the sites and sampling procedures and reports some data regarding direct effects of intensive harvesting. Harvesting, including bole-only and residue removal, is complete at most sites, and some ecosystem nutrient budgets are presented. Aboveground biomass and soil nutrient pools (N, P, K, Ca, Mg) are also given. Preliminary post-harvest effects data are discussed.

Portions of document are illegible.

Procaine, paracetamol, and chlorpromazine showed inhibition of post irradiation repair. The chlorpromazie effect could be further augmented by treatment of cells with procaine. Chlorpromazine was also found to be preferentially toxic to hypoxid bacterial cells, and the survivors showed extreme radiosensitivity to gamma rays. Chlorpromazine was found to inhibit tumour growth in swiss mice when given intraperitoneally as well as when injected directly into the tumour. When combined with single x-ray doses, significant radiosensitization was observed in two in vivo tumours sarcoma 180A and fibrosarcoma. These results indicated that chlorpromazine may prove a good drug for combined chemo-radiotherapy of solid tumours. Investigations continued studying various aspects such as effectiveness in other tumour lines, distribution in healthy and tumour bearing animals, hyperthermia and drug combination effects, and encapsulation of the drug in artificial liposomes and blood cells. 58227 (BNL—31581) **TRITOX: a multiple parameter evaluation of tritium toxicity.** Carsten, A.L. (Brookhaven National Lab., Upton, NY (USA)). 1982. Contract AC02-76CH00016. 36p. (CONF-820736—1). NTIS, PC A03/MF A01. Order Number DE82018100.

From 17. annual European Society for Radiation Biology meeting on effects of prenatal irradiation; Bordeaux, France (26 Jul 1982).

The increased use of nuclear reactors for power generation will lead to the introduction of tritium into the environment. The need for assessing possible immediate and long-term effects of exposure to this tritium led to the development of a broad program directed towards evaluating the possible somatic and genetic effects of continuous exposure to tritiated water (HTO). Among the parameters measured are the genetic, cytogenetic, reproductive efficiency, growth, nonspecific lifetime shortening, bone marrow cellularity and stem cell content, relative biological effectiveness as compared to ^{137}Cesium gamma exposure, and related biochemical and microdosimetric evaluations. These parameters have been evaluated on animals maintained on HTO at 10 to 100 times the maximum permissible concentration (0.03 - 3.0 μCi/ml) for HTO. Dominant lethal mutations, chromosome aberrations in regenerating liver, increased sister chromatid exchanges in bone marrow and reduction in bone marrow stem cell content have been observed at the higher concentrations. The relative biological effectiveness for HTO ingestion as compared to external ^{137}Cesium gamma exposures has been found to be between 1 and 2.

58228 (CNEN-RT/PROT—(80)30) **Evaluation of the dose to the Italian population from nuclear explosions.** Giorcelli, F.G. (Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipartimento Radiazioni e Ricerche di Sicurezza e Protezione). Dec 1980. 54p. (In Italian). NTIS (US Sales Only), PC A04/MF A01. Order Number DE82903032.

On the basis of experimental data collected in Italy, an evaluation is made of the dose commitment to the Italian population due to all the nuclear tests in atmosphere which occurred before 1976. The values obtained are compared with the average values referring to the temperate zone of the North hemisphere, published by the UNSCEAR (1977). The agreement is very good. Subsequently, on the basis of Italian experimental data, the dose commitment to the Italian population due to the nuclear tests in atmosphere which occurred in the period 1976 to 1978 is determined. The dose commitment referring to this period, mainly due to the explosion in the atmosphere of the first Chinese thermonuclear device, is about 4 mrad for gonads, 8 mrad for bone marrow and endo-osteal cells, and 6 mrad for lungs.

58229 (CNEN-RT/PROT—(80)37) **Tritium levels in the blood and urine of the normal population and in contaminated subjects.** Belloni, P.; Clemente, G.F.; di Pietro, S.; Quaggia, S. (Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipartimento Radiazioni e Ricerche di Sicurezza e Protezione). Dec 1980. 29p. (In Italian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82903100.

Portions of document are illegible.

The data referred to the tritium concentrations measured in blood and urine samples collected from 4 contaminated subjects and 32 individuals of both sexes members of the general population are reported in this paper together with a brief introduction on the environmental behavior of tritium, on its transfer to man and on its metabolism in man. The experimental data have indicated a large variability of the individual tritium concentrations in both urine (range: 0.5 to 4.0 pCi/ml) and blood (range: 2.7 to 13.4 pCi/ml) samples collected from nonexposed subjects. The mean concentration value of tritium in urine and blood samples in non exposed subjects has been evaluated to define the levels of tritium exposure measured in exposed subjects. The mean tritium concentration in the blood of the considered exposed subjects is 186 pCi/ml while the urine is 170 pCi/ml. The data obtained have been discussed to define the use of blood and/or urine as indicators of tritium internal contaminations of exposed subjects.

58230 (DOE/EV/10417—2) Immunochemical approach to the study of DNA repair. Proposed technical program and technical progress report. (New York Medical Coll., Valhalla (USA). Dept. of Microbiology; Columbia Univ., New York (USA). Coll. of Physicians and Surgeons). 1982. Contract AC02-80EV10417. 23p. NTIS, PC A02/MF A01. Order Number DE82019938.

A simple immunochemical assay to quantify DNA lesions is being developed in order to facilitate the study of DNA repair. Antibodies have been raised to 5,6-dihydroxy-dihydrothymine and to thymine dimers and these have been used to measure DNA damages produced by osmium tetroxide and ultraviolet light, respectively. An enzyme immunoassay has been developed and the sensitivity of this method will be compared to physical, enzymatic, and chemical methods using PM2 bacteriophage DNA. Finally DNA repair will be assayed in several model systems.

58231 (EDF-CONF—80DD01949) Contamination and cancers: low-dose risks and standards of radioprotection. Vignes, S. (Electricite de France, 75 - Paris. Comite de Radioprotection). 19 Sep 1980. 12p. (In French). (CONF-8009262—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702354.

From International symposium on life quality and geocancerology; Besancon, France (10 Sep 1980).

Irradiation of the population due to the running of nuclear power stations represents less than 1% of the natural radioactivity today, and should amount to 3% at most by the year 2000. The main effects of ionizing radiations are reviewed and their undetectability below 100 rems is underlined. Thus the evaluation of low-dose risks can only be speculative and the cautions hypothesis adopted is that of a linear relationship between dose and effect, together with the absence of threshold. According to calculations the worker, supposedly exposed to 500 mrem a year between ages 18 and 65, would run a 22.2% instead of the normal 22% risk of dying of cancer. As for the population, the risk would increase by only 1 per 10,000 in the year 2000. This means that no other mutagenic and carcinogenic agent is as well regulated as radioactive pollution and efforts directed at a better control of harmful chemicals, for instance, are only taking an example from the ruling on radioprotection.

58232 (IAE—3401/3) Method of calculating collective dose irradiation in region of radioactive source. Kovalevich, O.M.; Isaev, A.N.; Shashkov, M.G.; Konobaev, A.V.; Pavlovskij, O.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1981. 55p. (In Russian). NTIS (US Sales Only), PC A04/MF A01. Order Number DE82702647.

Possible modifications of collective irradiation dose due to nuclear power plant discharge into the atmosphere or another radioactive waste sources are considered. The volume of information essential for calculations is discussed. The effect of different representations of standard concentration distribution deviations on the final results is analysed. A method is suggested for collective dose calculation, based on main functional tabulation. The possibilities of simplified population collective dose calculations are considered.

58233 (INER—0388) Study of chromosome aberration yield in human lymphocytes as an indicator of radiation dose. Chang, Y.N.; Chen, M.D.; Fu, Y.K.; Tsai, C.M. (Institute of Nuclear Energy Research, Lung-Tan (Taiwan)). May 1981. 25p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82903222.

Biological dosimetry which uses human lymphocyte chromosome aberrations as an indicator of radiation dose was established. Human lymphocytes culture, slide preparation, and staining techniques are described in this report. The yields of dicentric and ring chromosomes are used as parameter of radiation damage. The results show that the lower limit of the method in this experiment for the x radiation is 48.0 rads. The dose-response curves of x rays and rays fit the following equations respectively: $Y = 1.70 \times 10^{-2} - 2.18 \times 10^{-4} D + 6.84 \times 10^{-6} D^2$; $Y = 4.45 \times 10^{-3} + 2.69 \times 10^{-5} D + 3.43 \times 10^{-6} D^2$ where Y is the yield of dicentric and ring chromosomes per cell and D is the x or γ radiation dose in rads. The chromosome aberration yield induced by γ irradiation is lower than that induced by x-ray exposure. The RBEs of γ rays are 0.60 and 0.55 with respect to x rays when doses are 200 rads and 400 rads respectively.

58234 (INIS-mf—7122) Pulse radiolysis study of the electron reaction with DNA in aqueous solution and ice. Some experimental and theoretical aspects. Verberne, J.B. (Vrije Univ., Amsterdam (Netherlands)). 18 Dec 1981. 226p. NTIS (US Sales Only), PC A11/MF A01. Order Number DE82780641.

Thesis.

Research is described into some aspects of the interaction of ionizing radiation with DNA, the main emphasis being on the indirect effect where the radiation causes the formation of intermediates in the surrounding medium which then interact with the DNA. Experiments are described which have been carried out to examine the dependence of the reaction rate constant on ionic strength and counterion charge. They show that for double stranded DNA (dsDNA) the reaction rate constant increases with ionic strength. To see whether quantitative agreement can be obtained between the observations and a physical interpretation the author combines a model for reaction kinetics and a refined model for the electrostatic potential into one to obtain a theoretical rate constant for reaction with a cylindrical polyelectrolyte. Optical absorption spectra of the electron adducts of ss- and dsDNA are shown to exist and they differ significantly from the spectra of the H and OH adducts. The spectra of the electron adducts of the nucleotides have been measured. Experiments are also described devoted to the precursor of the hydrated electron: the thermalized, dry electron. Although from a radiation chemical point of view the experiments yielded a lot of information (a direct observation of the dry electron, the kinetics of electron localization, the role of ice defects in the solvation process, etc.), they proved also that the dry electron does not react with DNA in an ice matrix. (Auth.).

58235 (LBL—14684) Genetics of x-ray induced double strand break repair in saccharomyces cerevisiae. Budd, M.E. (Lawrence Berkeley Lab., CA (USA)). Jul 1982. Contract AC03-76SF00098. 160p. NTIS, PC A08/MF A01. Order Number DE82020071.

Thesis.

The possible fates of x-ray-induced double-strand breaks in Saccharomyces cerevisiae were examined. One possible pathway which breaks can follow, the repair pathway, was studied by assaying strains with mutations in the RAD51, RAD54, and RAD57 loci for double-strand break repair. In order of increasing radiation sensitivity one finds: rad57-1(23°)> rad51-1(30°)> rad54-3(36°). At 36°, rad54-3 cells cannot repair double-strand breaks, while 23°, they can. Strains with the rad57-1 mutation can rejoin broken chromosomes at both temperatures. However, the low survival at 36° shows that the assay is not distinguishing large DNA fragments which allow cell survival from those which cause cell death. A rad51-1 strain could also rejoin broken chromosomes, and was thus capable of incomplete repair. The data can be explained with the hypothesis that rad54-3 cells are blocked in an early step of repair, while rad51-1 and rad57-1 strains are blocked in a later step of repair. The fate of double-strand breaks when they are left unrepaired was investigated with the rad54-3 mutation. If breaks are prevented from entering the RAD54 repair pathway they become uncommitted lesions. These lesions are repaired slower than the original breaks. One possible fate for an uncommitted lesion is conversion into a fixed lesion, which is likely to be an unrepairable or misrepaired double-strand break. The presence of protein synthesis after irradiation increases the probability that a break will enter the repair pathway. Evidence shows that increased probability of repair results from enhanced synthesis of repair proteins shortly after radiation. (ERB)

58236 (NUREG/CR—2503) Measurements of ^{234}U, ^{238}U and ^{230}Th in excreta of uranium-mill crushermen. Fisher, D.R.; Jackson, P.O.; Brodacynski, G.G.; Scherpelz, R.I. (Pacific Northwest Lab., Richland, WA (USA)). Jul 1982. 67p. (PNL—4027). GPO $5.00.

Uranium and thorium levels in excreta of uranium mill crushermen who are routinely exposed to airborne uranium ore dust were measured. The purpose was to determine whether ^{230}Th was preferentially retained over either ^{234}U or ^{238}U in the body. Urine and fecal samples were obtained from fourteen active crushermen with long histories of exposure to uranium ore dust, plus four retired crushermen and three control individuals for comparison. Radiochemical procedures were used to separate out the uranium and thorium fractions, which were then electroplated on stainless steel discs and assayed by alpha spectrometry. Significantly greater activity levels of ^{234}U and ^{238}U were measured in both urine and fecal samples obtained from uranium mill crushermen, indicating that uranium in the inhaled ore dust was cleared from the body with a shorter biological half-time than the daughter product ^{230}Th. The measurements also indicated that uranium and thorium separate in vivo and have distinctly different metabolic pathways and transfer rates in the body. The appropriateness of current ICRP retention and clearance parameters for ^{230}Th in ore dust is questioned.

58237 **(PB—82-159963) Radiation safety in nuclear medicine: a practical guide. Final report.** Sodd, V.J. (Bureau of Radiological Health, Rockville, MD (USA)). Nov 1981. 144p. (FDA/BRH—82/31). NTIS, PC A07/MF A01.

This publication brings together, in concise form, information regarding the many recommendations and requirements for safe operation of a nuclear medicine laboratory. The need for such a compendium was perceived by the staff of the Nuclear Medicine Laboratory. This need arises from several sources. Many individuals enter the field with little training in the handling of radioactive materials; for example, a physician trained in cardiology, oncology, or neurology. The increasing development of portable instrumentation has allowed movement of radiopharmaceuticals from the confines of the nuclear medicine lab to coronary and intensive care facilities where personnel may lack adequate knowledge of safe handling procedures. A health physicist, trained to account for all radioactive material placed under his control, may have difficulty adapting to the accepted practice of releasing a patient who has been administered millicurie quantities of radioactivity, with little or no control over subsequent disposal of excreta. Further differences exist between handling practices for radioactive materials in the scientific laboratory and in the medical facility. This guide tries where possible to clarify some of these issues.

58238 **(PB—82-165036) X-ray measurements and protection, 1913-1964: the role of the National Bureau of Standards and the national radiological organizations. Final report.** Taylor, L.S. (National Bureau of Standards, Washington, DC (USA)). Dec 1981. 390p. NTIS, PC A17/MF A01.

An account of the initial U.S. concerns with, and subsequent efforts to cope with, the safe use of ionizing radiation is given. National interest was focused in the National Bureau of Standards where radiation programs were established at the urging of, and with the close cooperation of, the radiological profession. The National Bureau of Standards' ionizing radiation research programs, the first in the U.S. Government, were dedicated to establishing a sound scientific base for x-ray measurement and protection. Along with the support and constant efforts of the national and international radiological organizations, the Bureau played a critically important role in the Nation's ability to use radiation effectively and safely. Based on widely scattered files assembled from both Government and non-government sources, this document represents a single source record of significant committee papers, correspondence, and decisions during the period 1913 to 1964, along with the author's summary of National Bureau of Standards' work, and the interrelated efforts of many others in the scientific community. A complete listing of the published output of the National Bureau of Standards' radiation staff is also included in this document. These papers contribute significantly to our understanding of ionizing radiation.

58239 **Microdosimetry of lymphocytes irradiated by alpha-particles.** Fisher, D.R.; Harty, R. (Pacific Northwest Lab., Richland, WA (USA)). *International Journal of Radiation Biology and Related Studies in Physics, Chemistry and Medicine;* **41**: No. 3, 315-324(Mar 1982).

Although the concept of absorbed dose is commonly used in radiation biology as a parameter for comparing the toxic effect of different levels of radiation on a system, there are situations where the absorbed dose by itself is inadequate, and additional dose distribution information is required to explain the observed biological effects. A good example is the irradiation of cells by alpha-particles. This paper reports the use of internal microdosimetry techniques to reinvestigate the dosimetry of two very similar experiments with apparently contradictory dose-response results. Yields of dicentric chromosome aberrations induced in human blood lymphocytes following in vitro exposure to dissolved americium or plutonium at two separate laboratories produced linear dose-response functions, but the slopes of the best-fit straight lines differed by a factor of 12. Our microdosimetric analysis showed the results of one experiment to be inconsistent with a uniform distribution of activity. It also showed that the difference in slope could be attributed to differences in particulate size and spatial distribution as a result of dissimilarities in procedures used for preparing the actinide solutions.

58240 **Identification of a second locus in Drosophila melanogaster required for excision repair.** Boyd, J.B. (Univ. of California, Davis); Snyder, R.D.; Harris, P.V.; Presley, J.M.; Boyd, S.F.; Smith, P.D. *Genetics;* **100**: No. 2, 239-257(Feb 1982).

The mur(2)201 locus in Drosophila is defined by two mutant alleles that render homozygous larvae hypersensitive to mutagens. Both alleles confer strong in vivo somatic sensitivity to treatment by methyl methanesulfonate, nitrogen mustard and ultraviolet radiation but only weak hypersensitivity to X-radiation. Unlike the excision-defective mei-9 mutants identified in previous studies, the mus(2)102 mutants do not affect female fertility and do not appear to influence recombination proficiency or chromosome segregation in female meiocytes. Three independent biochemical assays reveal that cell cultures derived from embryos homozygous for the mus(2)/sup D/^{1} allele are devoid of detectable excision repair. 1. Such cells quantitatively retain pyrimidine dimers in their DNA for 24 hr following UV exposure. 2. No measurable unscheduled DNA synthesis is induced in mutant cultures by UV treatment. 3. Single-strand DNA breaks, which are associated with normal excision repair after treatment with either UV or N-acetoxy-N-acetyl-2-aminofluorene, are much reduced in these cultures. Mutant cells possess a normal capacity for postreplication repair and the repair of single-strand breaks induced by X-rays.

58241 **Permeabilization of ultraviolet-irradiated chinese hamster cells with polyethylene glycol and introduction of ultraviolet endonuclease from Micrococcus luteus.** Yarosh, D.B.; Setlow, R.B. (Brookhaven National Lab., Upton, NY). *Molecular and Cellular Biology;* **1**: No. 3, 237-244(Mar 1981).

Chinese hamster V-79 cells were made permeable by treatment with polyethylene glycol and then incubated with a Micrococcus luteus extract containing ultraviolet-specific endonuclease activity. This treatment introduced nicks in irradiated, but not in unirradiated, deoxyribonucleic acid. The nicks remained open for at least 3 h; there was no loss of endonuclease-sensitive sites, and no excision of dimers as measured by chromatography was detected. In addition, there was no increase in ultraviolet resistance in treated cells. This suggests that the absence of a significant amount of excision repair in rodent cells is due to the lack of both incision and excision capacity.

58242 **Effects of the rad 52 gene on sister chromatid recombination in Saccharomyces cerevisiae.** Prakash, L.; Taillon-Miller, P. (Univ. of Rochester, NY). *Current Genetics;* **3**: 247-250(1981). Contract AC02-76EV03490.

Spontaneous and uv induced unequal mitotic sister chromatid recombination was examined in RAD+ and rad 52-1 strains carrying the LEU2 gene inserted in the rDNA locus. The rad 52-1 mutation does not affect spontaneous sister chromatid recombination but greatly reduces the frequency of uv induced sister chromatid recombination.

58243 **Mortality of the harvester ant (Pogonomyrmex owyheei) after exposure to ^{137}Cs gamma radiation.** Gano, K.A. (Pacific Northwest Lab., Richland, WA). *Environmental Entomology;* **10**: No. 1, 39-44(1981). Contract AC06-76RL01830.

Harvester ants, Pogonomyrmex owyheei Cole, irradiated with 3.5 kR to 268 kR of ^{137}Cs gamma radiation, were maintained at simulated summer (27°C) and winter (7°C) temperature regimes. After thirty days, the cool series was warmed to 27°C and observed for mortality along with the warm series. Though mortality was delayed in the cool series, each series reached 50% mortality at similar rates. Because the harvester ant is extremely tolerant to radiation and experimental rates used far exceed possible environmental exposure, it is unlikely that ant colonies dwelling among low-level nuclear waste storage sites will be deleteriously affected by radiation. This species has the capability of tunneling to a depth well within the range of some buried waste. Since these harvester ants are potential transporters of buried waste, they should be considered as a biotic factor in radioactive waste management operations in semi-arid regions.

5602 Thermal Effects

REFER ALSO TO CITATION(S) 56114, 58148, 58173

58244 Fish abundance and distribution near three heated effluents to Lake Michigan. Spigarelli, S.A.; Goldstein, R.M.; Prepejchal, W.; Thommes, M.M. (Argonne National Lab., IL). *Canadian Journal of Fisheries and Aquatic Science;* **39**: No. 2, 305-315(1982).

A combined echo location-temperature mapping technique was used to determine the abundance and distribution of fish with depth and temperature in locally heated and unheated areas of Lake Michigan. Surveys were conducted between April and October at two adjacent power plants in the southern basin and at one plant in the northern basin of the lake. Fish densities in plume and reference areas differed seasonally. Densities typically differed by a factor of 2 to 4 although on one occasion plume area density was 90 times greater. Highest plume densities occurred during late spring when alewife (Alosa pseudoharengus) were spawning inshore. Consistently dense congregations of fish were found downstream of the interfaces between ambient shore-parallel currents and discharge flows. The general distribution of fish with depth was similar in all areas. Differences between plume and reference areas were related to the discharge type: at canal discharges fish tended to congregate inshore while at the offshore discharge they congregated in deeper zones. Fish also tended to occupy shallower depth strata in all plume areas. Positive correlation between fish density and increasing temperature was common at both plume and reference areas during all three seasons, but more frequent at plume areas. Temperature selected by fish in plume areas were 1 to 3°C higher than maximum ambient temperatures.

58245 (AD-A—110756/4) A plant bioindicator system for estimating pollution abatement - elucidation of the ultrastructural, physiological, and biochemical basis of sensitivity and tolerance to NO_2, SO_2, and O_3. Final report 1 July 1978-31 December 1981. Skelly, J.M.; Yang, Y. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA)). 15 Jan 1982. 14p. NTIS, PC A02/MF A01.

The specific objectives of this research are: (1) to compare the stomatal frequency of two selected eastern white pine, one sensitive and one tolerant to O_3; (2) to characterize the fine structure of the epicuticular wax on needle surface and to compare the wax structure of the two selected clones; (3) to continue the determination of the relative sensitivity of selected eastern white clones to NO_2, SO_2, and O_3 used singly and in combination; (4) to investigate photosynthetic and respiratory rates of different eastern white pine clones during light and dark conditions as influenced by NO_2, SO_2, and O_3; and (5) to determine the influence of NO_2, SO_2, and O_3 fumigation on needle chlorophyll content. A summary of the most important results is given and papers produced by the participants are listed.

58246 (AD-A—110802/6) Forest tree growth as a bioindicator of pollution abatement systems at the Radford Army Ammunition Plant. Final report 1 Jul 76-30 Jun 78. Skelly, J.M.; Kress, L.W. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA). Dept. of Plant Pathology and Physiology). 14 Jan 1982. 14p. NTIS, PC A02/MF A01.

The study objectives of this research were: (1) to determine if the pollution levels alone were responsible for the observed growth suppressions in trees growing at Radford Army Ammunition Plant (RAAP); (2) to screen several full-sib families of loblolly pine and half-sib families of American sycamore for tolerance or sensitivity to O3, SO2, and NO2; (3) to identify and quantify the effects to loblolly pine and sycamore of long-term low-level exposures to O3, SO2, and NO2 in combination; (4) to demonstrate the success or failure of the abatement programs now being initiated at the RAAP, with loblolly pine and/or American sycamore as bioindicators; and (5) to contribute to the field of air pollution effects on plants an understanding of the growth impact of pollutant interactions.

58247 (CONF-820122—8) Human serum teratogenicity studies using in vitro cultures of rat embryos. Klein, N.W.; Chatot, C.L.; Plenefisch, J.D.; Carey, S.W. (Connecticut Univ., Storrs (USA)). 1982. Contract AC02-76EV03139. 9p. NTIS, PC A02/MF A01. Order Number DE82020382.

From Symposium on the application of short-term bioassays in the analysis of complex environmental mixtures; Chapel Hill, NC, USA (25 Jan 1982).

Those conditions that constitute reproductive risks to man are being analyzed. Particular concern is with those conditions that cannot be or have not been identified by present methodologies. These conditions constitute the majority of factors causing fetal wastages and birth defects. The test system uses intact rat embryos that are cultured in vitro for 2 days. Findings to date suggest that this system may have a number of distinct advantages: (1) whole-embryo culture provides the test with the entire repertoire of processes involved in embryonic development; (2) whole-rat embryos can be cultured on high levels of blood serum; and (3) they can be cultured on serum from human subjects, which provides a direct and unique evaluation of the principal organism of concern. In regard to this last point, it is important to recognize that there is a large range of teratogenic responses and sensitivities to teratogens dependent upon both individual and species differences. (ERB)

58248 (DOE/EV/03139—46) Embryo culture in teratological surveillance and serum proteins in development. Progress report, 1981-1982. Klein, N.W. (Connecticut Univ., Storrs (USA). Dept. of Animal Genetics). Aug 1982. Contract AC02-76EV03139. 11p. (COO—3139-46). NTIS, PC A02/MF A01. Order Number DE82020443.

Major efforts have focused on three areas: the teratogenic effects of anticonvulsants and thalidomide in monkeys and rats; the teratogenic risks of occupational and environmental exposures as well as cigarette smoke on rat embryo cultures; and the use of rat embryo cultures to detect teratological and reproductive risks. (ERB)

58249 (LA—9113-MS) Long-term effects of intragastric instillations of Sylgard 184 encapsulating agent. Smith, D.M.; Drake, G.A.; London, J.E. (Los Alamos National Lab., NM (USA)). Dec 1981. Contract W-7405-ENG-36. 6p. NTIS, PC A02/MF A01. Order Number DE82007029.

Young male Sprague-Dawley rats (68 days old) were given a single dose [5 g/kg body weight (BW)] of Sylgard 184 encapsulating resin intragastrically (IG), and young female Swiss-Webster mice (87 days old) were given a single dose (5 g/kg BW) IG, or a dose (1 g/kg BW) IG on each of 5 consecutive days, of Sylgard 184 encapsulating resin. All animals were then maintained for the rest of their lives and autopsied at death.

58250 (PB—82-151309) Coal tar pitch sampling analysis. Final report. Coulter, P.D.; Petro, B.A. (Union Carbide Corp., Parma, OH (USA). Research Lab.). 14 Jul 1972. 146p. NTIS, PC A07/MF A01.

The abilities and efficiencies of sampling procedures and analytical methods are evaluated so that potential hazards associated with coking and roofing operations may be determined. Methods are presented for the determination of: benzene soluble material, polynuclear aromatic compounds, benzo(a)pyrene in airborne particulates, the composite emission index of volatile matter collected on air sampling filters and on glass fiber filters, trace metals in airborne particulates, and organic vapors. Methods are given for polynuclear aromatics using gas chromatography and ultraviolet spectrophotometry, and liquid chromatography and spectrophotometry, after different extraction techniques. Modifications, improvements, and drawbacks to the methods are noted.

58251 **(PB—82-152208) Inhalation toxicity study of nitrous oxide and halothane in rats. Final report.** (Hazleton Labs. America, Inc., Vienna, VA). 24 Feb 1977. 46p. NTIS, PC A03/MF A01.

The mutagenic potential of long-term exposure of 120 male Sprague-Dawley rats to nitrous oxide is measured by observing aberrations in bone marrow cell chromosomes. Forty rats serve as controls, 40 are exposed to 50 ppm nitrous oxide plus 1 ppm halothane, and 40 are exposed to 500 ppm nitrous oxide plus 10 ppm halothane, for 7 hours a day, 5 days a week for 52 weeks. The most frequently found aberration is the chromatid gap. There is a significant increase in the number of gaps and this increase is dose-related. Chromatid breaks are the next most frequent aberrations observed. Chromosomal breaks are comparable among all groups. Chromosomal markers are significantly increased in the group receiving 500 ppm nitrous oxide. The incidence of polyploidy is comparable among control and treated groups. Fifty-nine percent of the animals in the first treatment group show aberrant cells; 68% in the second treatment group. It is concluded that exposure to 500 ppm nitrous oxide plus 10 ppm halothane can cause chromosomal damage to bone marrow cells in the rat.

58252 **(PB—82-152216) The development and evaluation of an electronic emission spectral index which can be related to the carcinogenic hazard of the respirable portion of coal-tar pitch volatiles. Final report 1 Jun 71-31 May 72.** (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). May 1972. 157p. NTIS, PC A08/MF A01.

The possibility of relating an electronic emission spectral index to the carcinogenicity of respirable portions of coal-tar pitch volatiles is investigated. Photophysical properties are determined for 34 polynuclear aromatic hydrocarbons and their heterocyclic analogs. Statistical analysis of the results indicates that there is no significant correlation, with the exception of fluorescence lifetimes, between these properties and the known carcinogenic activity of the compounds studied. An electronic emission spectral index for carcinogenic hazards based on these photophysical properties does not exist for the compounds studied. An index based on fluorescence lifetimes could potentially be used to evaluate the carcinogenic hazard of an untested pure compound, but such an index would not be applicable to mixtures. Testing the photodynamic activities of the compounds using the crustacean Artemia salina shows good statistical correlation between photodynamic activity and carcinogenicity. This method, although untested on mixtures, should be applicable to air samples and other polynuclear aromatic mixtures.

58253 **(PB—82-158544) The health effects of coal-burning power plants in minnesota.** Ross, D. (Minnesota Public Interest Research Foundation, Minneapolis (USA)). 1981. 54p. NTIS, PC A04/MF A01.

The carcinogenic properties of coal combustion products are described and documented with emphasis on beryllium, mercury, and other particulates. Increased coal use in Minnesota and implications of such increases for 1976-1995 are discussed. Details of how a coal-fired power plant works and how pollutants are formed are described. Efforts to minimize health impacts of sulfur oxides and particulates are detailed. An analysis is provided of how health impacts are measured, showing how a lack of precision and data makes it difficult for policymakers to decide which pollutants need regulation and how much regulation is required. It was found that the greatest problem resulting from coal burning in Minnesota is fine particulate pollution. Fine particulates have been implicated in the exacerbation of emphysema, bronchitis, and lung cancer. Increased regulation and limitations on the construction of coal burning electricity generators are supported.

58254 **(PB—82-161282) Acrolein health effects. Final report.** Carson, B.L.; Beall, C.M.; Ellis, H.V. III; Baker, L.H.; Herndon, B.L. (Midwest Research Inst., Kansas City, MO (USA)). Sep 1981. 128p. NTIS, PC A07/MF A01.

Health effects literature primarily related to inhalation exposures to acrolein was collected, evaluated, tabulated, and summarized. Approximately 125 documents were collected from computerized and manual literature searches covering the period 1911-1981. Pharmacologists and an M.D. epidemiologist rated the documents according to their applicability to the study and their methodology. The approximately 45 documents considered useful for deriving a range of concern for human exposure to acrolein from automotive emissions were tabulated. The pages of tables detail the results of acute, repeated dose, and chronic testing of mice, hamsters, rats, guinea pigs, chickens, rabbits, cats, monkeys, dogs, and humans as well as human occupational and accidental studies. Most of the documents evaluated are described in an annotated bibliography.

58255 **(PB—82-162397) Formaldehyde health effects. Task 5 report (final).** Carson, B.L.; McCann, J.L.; Beall, C.M.; Baker, L.H.; Ellis, H.V. III. (Midwest Research Inst., Kansas City, MO (USA)). 21 Dec 1981. 270p. NTIS, PC A12/MF A01.

Health effects literature primarily related to inhalation exposure to formaldehyde was collected, evaluated, tabulated, and summarized. Approximately 425 documents were collected from computerized and manual literature searches covering the period 1905-1981. Pharmacologists and an M.D. epidemiologist rated the documents according to their applicability to the study and their methodology. The approximately 110 documents considered useful for deriving a range of concern for human exposure to formaldehyde from automotive emissions were tabulated. The 145 pages of tables detail the results of acute, repeated dose, and chronic testing of mice, hamsters, rats, guinea pigs, rabbits, cats, pigs, dogs, monkeys, and humans as well as human occupational and epidemiological studies. Most of the documents evaluated are described in an annotated bibliography.

58256 **(PB—82-164849) Cytogenetic evaluation of bone marrow cells in the rat following long term inhalation exposure to nitrous oxide plus halothane. Final report.** (Hazleton Labs. America, Inc., Vienna, VA). 1970. 27p. NTIS, PC A03/MF A01.

The mutagenic potential of long-term exposure of 120 male Sprague-Dawley rats to nitrous oxide is measured by observing aberrations in bone marrow cell chromosomes. Forty rats serve as controls, 40 are exposed to 50 ppm nitrous exide plus 1 ppm halothane, and 40 are exposed to 500 ppm nitrous oxide plus 10 ppm halothane, for 7 hours a day, 5 days a week or 52 weeks. The most frequently found aberration is the chromatid gap. There is a significant increase in the number of gaps and this increase is dose-related. Chromatid breaks are the next most frequent aberrations observed. Chromosomal breaks are comparable among all groups. Chromosomal markers are significantly increased in the group receiving 500 ppm nitrous oxide. The incidence of polyploidy is comparable among control and treated groups. Fifty-nine percent of the animals in the first treatment group show aberrant cells; 68% in the second treatment group. It is concluded that exposure to 500 ppm nitrous oxide plus 10 ppm halothane can cause chromosomal damage to bone marrow cells in the rat.

58257 **(PB—82-164872) Results of the controlled exposure of human females to the vapor of methylene chloride.** Hake, C.L.; Stewart, R.D.; Forester, H.V.; Lebrun, A.J.; Peterson, J.E. (Medical Coll. of Wisconsin, Milwaukee (USA). Dept. of Environmental Medicine). Mar 1974. 25p. NTIS, PC A02/MF A01.

The results of controlled exposure of human females to the vapor of methylene chloride (75092) are presented to supplement a previous comprehensive study of the effects of industrial exposure levels on male human subjects. The data obtained for nine healthy, volunteer human females, aged 20 to 41 years, concerned details of their general health and smoking habits, carboxyhemoglobin (COHb) levels, blood tests, EKG's urinalyses, and behavioral performances during and after the experiment. None of the subjects were exposed to abnormal levels of carbon monoxide (CO) (630080). Another report will cover the breath decay curves obtained during this study. The subjects completed subjective response forms at hourly intervals, noting any physiological reactions or symptoms. Neurological, behavioral and medical tests revealed no deleterious effects on the subjects. The determination of blood COHb saturation is considered to be a very accurate measure both of CO exposure and of the metabolization of methylene chloride to CO; so it is not recommended for monitoring industrial exposures to methylene chloride vapors where there is the possibility of low levels of CO in the atmosphere.

58258 **(PB—82-182536) Health hazard evaluation report No. HETA-81-054-1010, Environmental Protection Agency, San Francisco, California.** Belanger, P.L.; Okawa, M.T. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). Dec 1981. 11p. NTIS, PC A02/MF A01.

In February 1981, the National Institute for Occupational Safety and Health (NIOSH) received a request for a health hazard evaluation from a representative of the Environmental Protection Agency workers, Local No. 1 of the National Federation of Federal Employees. The requestor was concerned that employees working on the fifth and sixth floors at 215 Fremont Street, San Francisco, CA., may be exposed to street level vehicle exhausts entering the intake ventilation system located on the rooftop. It was reported that diesel fumes were smelled occasionally during the day. Several workers were reported to complain of headaches, stuffy nose and upper respiratory irritation. Also, there were complaints that an improperly operating ventilation system caused overheating or overcooling which prolonged workers colds and sore throats.

58259 **(PB—82-184573) Health hazard evaluation report No. HHE-80-195-811, Elco Corporation, Connector Division, Huntingdon, Pennsylvania.** Conover, D.L.; Chronstek, W.J. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Surveillance, Hazard Evaluation and Field Studies). Feb 1981. 14p. (HHE—80-195-811). NTIS, PC A02/MF A01.

Personal air samples were analyzed, radiofrequency (RF) radiation was measured and employees were given medical questionnaires at Elco Corporation (SIC-3678) in Huntingdon, Pennsylvania on September 5 and November 5 and 6, 1980. Employees of Elco Corporation requested the evaluation due to their concern that RF or ultraviolet radiation was causing eye and skin irritation, nausea and scalp lumps. Of the 450 employees at the facility only 5 were exposed to RF radiation. Measurements of electric and magnetic field strengths were made for the eyes, neck, chest, waist, gonads, knees, ankles and hands. None of the RF measurements exceeded the OSHA standards of 40,000 square volts per square meter and 0.25 square amperes per square meter. Air samples contained concentrations of hydrogen-chloride (7647010) below the limit of detection and ozone (10028156) concentrations to 60 micrograms per cubic meter, below the OSHA standard of 200 micrograms per cubic meter. Medical questionnaires of five employees revealed one with eye irritation, two with skin irritation, one with sore throat and one with a heart problem. The authors conclude that a hazard does not exist due to RF radiation exposure. Problems due to infrared, ultraviolet and visible light may have caused skin and eye complaints; these problems were rectified by installation of a darkened plastic shield. Recommendations include shielding and tuning of machines, use of proper procedures during maintenance, and an increase in distance between worker and RF source.

58260 **(PB—82-184649) Health hazard evaluation report No. HHE-80-233-793, Davis Bessie Nuclear Power Station, Toledo Edison Company, United Engineers and Contractors Company (UE and C), Oak Harbor, Ohio.** Cone, J.; Hartle, R. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Surveillance, Hazard Evaluation and Field Studies). Jan 1981. 14p. (HHE—80-233-793). NTIS, PC A02/MF A01.

Personal air samples were analyzed and employees were given medical evaluations at Davis Bessie Nuclear Power Station (SIC-4911) in Oak Harbor, Ohio. Requests for evaluation were made by a union representative of the United Engineers and Contractors and a union representative of employees of Toledo Edison Company, working on site at the power station, to evaluate employee skin and scalp problems due to exposure to ceramic wood fibers. Preliminary surveys were conducted on September 24 and 25, 1980 and a follow-up survey was performed on October 16, 1980. Environmental evaluation consisted of gravimetric analyses of personal air samples for airborne ceramic wool fibers. A total of 400 production and maintenance workers and varying numbers of construction workers were exposed to the fibers during installation of insulation which was completed at the time of the survey. The three personal air samples showed no accumulation of particulates and fibers detected were nonrespirable. Medical evaluations were conducted in 52 workers and scalp scrapings were obtained from 43 workers. Thirty seven workers had histories suggestive of irritant dermatitis of the scalp; 24 workers had physical findings consistent with the diagnosis. Of the 43 scalp samples, 18 were contaminated with organisms of the gut, perineum, skin or respiratory tract. Dermatitis was directly related to the history of dust exposure. The authors conclude that a potential health hazard exists for employees from exposure to ceramic wool fiber. Recommendations include provision of handwashing facilities and protective clothing for employees, and installation of an impermeable covering for the ceramic wool fiber.

58261 **(PB—82-192709) Development of a biological screening method to detect potential exposure of synfuel plant workers to carcinogenic substances. Final report.** Hannan, M.A.; Recio, L.; Enoch, H.G.; Hill, R.H. (Kentucky Dept. of Energy, Lexington (USA)). Nov 1981. 84p. NTIS, PC A05/MF A01.

The purpose of this project was to determine the feasibility of using the Ames assay as a biological monitoring tool to evaluate exposure to mutagens/carcinogens, which may be possibly generated by a synfuel plant. Phase I of this project consisted of analyzing urine samples of cigarette smokers and non-smokers for mutagenicity in order to establish that this assay can reproducibly detect mutagens present in smokers' urine, as well as to distinguish smoking-related mutagenic urine samples from work-related ones. This was necessary to develop a standardized protocol for urine screening. Phase II consisted of an extension of Phase I to examine mutagen activity as cake-oven workers, exposed to known carcinogens and known to have increased cancer risks. Phase II consisted of an analysis of mutagenic activity in urine samples from volunteer workers at the H-coal pilot plant at Catlettsburg, Ky.

58262 **(PB—82-915000) TOX-TIPS. Monthly reports.** (National Library of Medicine, Bethesda, MD (USA). Toxicology Information Program). 1982. vp. Paper copy available on subscription, North American Continent price $40.00/year; all others write for quote. Single copies also available.

TOX-TIPS results from a cooperative effort to prevent the duplication of toxicity testing programs and epidemiology studies to determine toxic risks of chemical substances and other agents. Input to TOX-TIPS is submitted on Science Information Exchange (SIE) Notice of Research Project forms included in each TOX-TIPS issue. Prompt reporting of new projects to the Editor, TOX-TIPS reduces the chances of duplication as material is usually printed in the first issue scheduled after its receipt. After the project description and related data are published, the information is relayed to SIE for inclusion in that national database of information on research-in-progress. Inquiries and requests for sample issues of publications should be directed to the EDITOR, TOX-TIPS at the National Library of Medicine. Subscription activities are managed by the National Technical Information Service which should be contacted directly.

58263 (UCRL—87003) Extrapolation of mutagenicity testing to the human. Mendelsohn, M.L. (Lawrence Livermore National Lab., CA (USA)). 8 Dec 1981. Contract W-7405-ENG-48. 7p. (CONF-811156—2). NTIS, PC A02/MF A01. Order Number DE82006744.

From Symposium on genetic toxicology: an agricultural perspective; Davis, CA, USA (1 Nov 1981).

The concept of mutagen testing is discussed in terms of the ability to extrapolate data from non-human test samples to mutagenic potential in humans. The question of the correlation between mutagenesis and carcinogenesis is also discussed. (ERB)

58264 Blood carbon monoxide levels in persons 3 to 74 years of age: United States, 1976-1980. Radford, E.P. (Univ. of Pittsburg, PA); Drizd, T.A. *Advance Data from Vital and Health Statistics;* No. 76, 1-24(17 Mar 1982). Contract AC02-77EV04552.

This report presents national estimates of the distribution of carbon monoxide levels in the blood of persons ages 3 to 74 years in the United States by age, smoking status, race, urbanization status of residence, annual family income, and season of the year. These findings will be described and analyzed further in a report in the Vital and Health Statistics series (in preparation). In this report the relative contributions of the four principal sources of carbon monoxide (smoking, ambient or outdoor exposures, occupational exposures, and indoor exposures) to COHb levels are examined. Of these, smoking is the most significant and widespread, although in special circumstances each of the other contributors assumes some importance.

58265 Structure-mutagenicity analysis with the CHO/HGPRT system. Hsie, A.W. (Oak Ridge National Lab., TN). *Food and Cosmetics Toxicology;* **19**: 617-621(1981). Contract W-7405-ENG-26.

Using a mammalian cell gene mutational assay, the Chinese hamster ovary cell/hyposanthine-guanine phosphoribosyl transferase (CHO/HGPRT) system, we have studied the structure-mutagenicity of ten alkylating agents and six platinum(II) chlorammines. In analyzing the mutagenesis data, we describe the mutagenic activity as the number of mutants per 10^6 clonable cells induced by a 1 μM concentration of chemical tested. The mutagenicity of alkylating chemicals decreases with increasing size of the alky group; methylating agents are three to six times more mutagenic than the corresponding ethylating agents, cis-$Pt(NH_3)_2Cl_2$ is mutagenic, but its steric isomer, trans-$Pr(NH_2)_2Cl_2$, is very much less mutagenic. These results, together with determination of chemically induced DNA lesions permit analyses of certain aspects of mechanisms of chemical mutagensis.

58266 Statistical inconsistencies in the use of no-observed-effect levels in toxicity testing. Skalski, J.R. (Pacific Northwest Lab., Richland, WA). *American Society for Testing and Materials, Special Technical Publication;* No. 737, 377-387(1981).

Use of the no-observed-effect level (NOEL) as an experimental end point violates the principle of negative inference, the logical basis of statistical hypothesis testing. The NOEL is based on the nonrejection of the hypothesis of no toxic effect, whereas scientific methods stress conclusions based on the rejection of a hypothesis. Failure to reject this hypothesis may result either because the concentration is safe or because the experimental protocol to detect a toxic response is insensitive, but the cause is indeterminant and the error rate unknown. The lowest rejected concentration tested (LRCT) is recommended as an experimental end point. By the use of LRCT the rate of misclassification is known and is equal to α. Experimental designs that emphasize both the biological and the statistical significance of LRCT end points are recommended.

58267 Toxicity of Santa Barbara seep oil to starfish embryos. Part 1. Hydrocarbon composition of test solutions and field samples. Stuermer, D.H.; Spies, R.B.; Davis, P.H. (Lawrence Livermore National Lab., CA). *Marine Environmental Research;* **5**: 275-286(1981). Contract W-7405-ENG-48.

The composition and concentration of the water-soluble fraction (WSF) of four oils (Prudhoe Bay Crude, Holly Monterey Crude, Holly Rincon Crude and Isla Vista Seep Oil) are described. Changes in concentration and composition with exposure time in our bioassay chambers are described. Rapid concentration decreases and an unusual compositional relationship point to the importance of performing chemical analyses in conjunction with bioassay experiments. Comparison of the chemical composition of dissolved hydrocarbons in seawater at the Isla Vista Seep Oil site with the WSF of the seep oil shows many similarities, although the concentration is lower than the WSF by approximately 1000-fold.

58268 Biological exposure sensors in coal-conversion technologies. Garrett, A.S. Jr. (Oak Ridge Natl Lab, TN). *American Society for Testing and Materials, Special Technical Publication;* No. 721, 166-170(1980). (CONF-790832—).

From 4. biennial Boulder symposium; Boulder, CO, USA (6 Aug 1979).

The health of employees involved in coal-conversion research at the Oak Ridge National Laboratory, Oak Ridge, Tennessee, is assessed in a broad program of surveillance, which includes testing aimed at evaluation of general health, as well as special attention to the lungs and skin because of their potential for exposure to carcinogens. Included are sputum cytology for the detection of premaglignant change and dermatologic examinations, aided by a review of prior photographs. The expansion of surveillance into areas of enzyme and metabolite assessment is anticipated to expand our battery of biological sensors. 7 refs.

58269 Significance of low molecular weight, metallothionein-like proteins in marine invertebrates: current status. Roesijadi, G. (Battelle Pacific Northwest Labs., Sequim, WA). *Marine Environmental Research;* **4**: 167-179(1980).

Low molecular weight, metal-binding proteins have been shown to occur in several marine invertebrate species. The molecular weights, metal contents, and induction of these proteins by metals such as cadmium, zinc, copper, and mercury suggest close similarities to metallothionein, a sulphydrl-rich, metal-binding protein of widespread occurrence in vertebrates. Metallothionein has, to date, been identified in two species of brachyuran crabs. The identity of the protein in other marine invertebrate groups such as molluscs is still to be determined. Continued study of the metal-binding proteins will undoubtedly contribute to our understanding of both the normal metabolism and toxicology of certain trace metals in marine species. It appears that these proteins may be involved in the sequestration and detoxification of metals. Organisms which have been exposed to metals such as cadmium, zinc, copper, or mercury in the laboratory or field exhibit enhanced levels of metals which are associated with the metal-binding proteins. Additional studies will be required in order to determine the biochemical and physiological significance of such bound metals.

58270 (EPRI-CS—2477) Feasibility study of chemical detoxification of polychlorinated biphenyl capacitors. Phase I study. Final report. Miille, G.J.; Weitzman, L. (Acurex Waste Technologies, Inc., Mountain View, CA (USA)). Jun 1982. 87p. NTIS, PC A05/MF A01. Order Number DE82906427.

Portions of document are illegible.

Chemical detoxification of polychlorinated biphenyl (PBC) using sodium metal reduction is emerging as a significant new method of destroying PCB liquids. The results of a preliminary study on chemical detoxification as it applys to PCB's in capacitors are reported. The results of the first phase of a two-phase study are presented to evaluate the possibility of chemical processing of PCB capacitors. Phase I consists of the following tasks: literature search, acquisition of EPA permits for PCB research, evaluation of the legal and regulatory requirements of this process, design specialized equipment for handling PCB capacitors in the laboratory, and design Phase II research program. Phase II tasks are described. The results of the first-phase program were very encouraging. Based on available information, it appears possible to chemically destroy PCB's in capacitors. This report identifies questions that must be answered by the Phase II (laboratory) program before the feasibility of such an operation can be determined. Finally, this report describes a research program that must be followed to answer the previously mentioned questions, and to develop the design data for a full-scale capacitor treatment system.

58271 **(PB—82-168360) Evaluation and abatement of noise from aircraft auxiliary power units and airport ground power units. Technical report (final).** Staiano, M.A.; Samis, R.A.; Toth, S. (ORI, Inc., Silver Spring, MD (USA)). 7 Oct 1980. 100p. NTIS, PC A05/MF A01.

APUs and GPUs provide essential service to aircraft during ground operations. Sound levels near these devices range from 80 to 87 dBA at 30 m for APUs, 83 to 103 dBA at 10 m for turbine-engined GPUs, and 71 to 80 dBA at 10 m for piston-engined GPUs. Procedures are provided for: (1) estimating community sound levels due to APUs and GPUs, (2) estimating their exposures in terms of day-night sound levels, and (3) assessing the desirability of noise abatement by comparison to recommended levels for acceptability. Noise abatement options include: operational changes, equipment movement, equipment substitution, equipment quieting, and sound barrier usage.

58272 **An alternative to ecologic regression analysis of mortality rates.** Selvin, S. (Univ. of California, Berkeley); Merrill, D.; Sacks, S.T. *American Journal of Epidemiology;* **115**: No. 4, 617-623(Apr 1982). Contract W-7405-ENG-48.

A number of recent papers have used geographically defined data and linear models to study the relationship between a series of epidemiologic factors and the frequency of disease. This "ecologic regression" approach involves serious problems of interpretation. An alternate approach is discussed that does not depend on statistical models, produces easily interpreted results and yields statistical summaries that approximately parallel regression analysis. This alternative procedure is illustrated by using acute lymphocytic leukemia mortality data on a county level from among white females less than five years of ages between 1969-1977.

58273 **(CEA-N—2237) Relationships between environment and characteristics of marine Fe-Mn deposits in the Romanche trench.** Bonte, P. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service d'Electronique Physique). Nov 1981. 260p. (In French). NTIS (US Sales Only), PC A12/MF A01. Order Number DE82702352.

Thesis.

The geological characteristics and Fe-Mn deposits from the North wall of the Romanche trench (Atlantic ocean) were studied in order to investigate possible relationships of these deposits with hydrothermalism. The results indicate diffuse hydrothermal activity in all of the rock samples which may explain the notable mineralogical associations observed, such as talc-dolomite-hematite-serpentine. All rock outcrops were covered with Fe-Mn deposits, but no such deposits were noted on sedimentary platforms. The variations in average chemical composition are very low among the different deposits. Hence, the phenomenon which produces these deposits is not localized. From this study, we conclude that marine Fe-Mn deposits result from the continuous supply of terrigenous iron and discontinuous supply of manganese, probably hydrothermal in origin. Detrital particles and numerous chemical elements are scavenged during the accretion process itself, whereas some trace elements, among the least soluble (Co, Ti, Th, Ce), are adsorbed on these deposits, independently of the accretion. This explains the inverse variation of the content of these elements versus deposit thickness.

58274 **(SAND—82-0770) Bibliography of geology of Southeastern New Mexico.** Shaffer, S.E. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1982. Contract AC04-76DP00789. 156p. NTIS, PC A08/MF A01. Order Number DE82016408.

This volume is composed of 1464 geological citations cross-indexed by subject and author. A reference map is included.

58275 **Dating of obsidian artifacts by depth-profiling of artificially hydrated surface layers.** Tsong, I.S.T.; Smith, G.A.; Michels, J.W. (Pennsylvania State Univ., University Park (USA)); Wintenberg, A.L.; Miller, P.D.; Moak, C.D. (Oak Ridge National Lab., TN (USA)). *Nuclear Instruments and Methods in Physics Research;* **191**: No. 1-3, 403-407(31 Dec 1981).

From 5. international conference on ion beam analysis; Sydney, Australia (16 - 20 Feb 1981).

Fresh surface of obsidians are hydrated in the laboratory and the thicknesses of the hydrated layers are determined by hydrogen depth-profiling using secondary ion mass spectrometry (SIMS) and ^{19}F nuclear reaction. From our results, we conclude that it is feasible to establish a hydration equation which will allow obsidian artifacts to be independently dated by their hydrated depths. However, it is important to operate in hydration time and temperature regimes in which dissolution of the obsidian surface can be avoided.

58276 **(FOA-C—20431-T1) Common data base experiment: progress report on data analysis.** Barkeby, G.; Bergkvist, N.O.; Dahlman, O.; Johansson, P.; Ohlsson, H.; Roy, F. (Foersvarets Forskningsanstalt, Stockholm (Sweden)). Nov 1981. 73p. Dep. NTIS (US Sales Only), MF A01. Order Number DE82904738.

Portions of document are illegible.

The purpose of the Common Data Base Experiment (CDBE) was to create a common comprehensive and high quality seismic data base from a large number of globally distributed stations. This data base is to be used to study various issues connected to the establishment of an international verification system for a CTB and especially the functions at International Data Centers. This report summarizes the results obained so far at the temporary data center facilities at the National Defence Reseach Institute in Stockholm. The analyzed data were collected during a two weeks period in October 1980 with the contribution of bulletins, so called level I data, from 59 stations in 21 countries and waveform data, so called level II data, from 58 stations in 13 countries. The results presented here are far from being complete and must be treated as preliminary.

58277 **(NUREG/CR—2484) Geophysical investigations of the western Ohio-Indiana region. Technical report (final) Nov 75-Sep 81.** Jackson, P.L.; Christensen, D.H.; Mauk, F.H. (Michigan Univ., Ann Arbor (USA)). Jan 1982. 178p. NTIS, PC A09/MF A01.

The geophysical investigations of the Western Ohio and Indiana regions include the maintenance of a precision seismograph network to monitor earthquake activity. Data generated by this network, supplemented with other information, are used to analyze regional seismicity and to interpret the local geologic and seismotectonic structure. Four array stations in Indiana were added to the nine stations near Anna, Ohio, and the Ohio stations were upgraded by replacing seismometers and installing more stable electronic systems. A new digital computer with analog-to-digital convertors was obtained for direct digital recording and other digital analysis. Ten small earthquakes in the Anna region were recorded, six in a very tight cluster near the village of Anna. Only one of the earthquakes was felt. P-wave studies show an azimuthally dependent difference in residuals between stations within the Western Ohio array--a difference which can only be caused by significant variation in local structure. Aftershocks were recorded, public responses obtained and classified, and intensity contours drawn for the 5.1 magnitude earthquake on July 27, 1980, in Sharpsburg, Kentucky.

58278 **In situ stress field in the southeastern United States and its implication.** Stephenson, D.E. (E.I. du Pont de Nemours & Co., Aiken, SC); Pratt, H.R. *Southeastern Geology;* **22**: No. 3, 115-121(Aug 1981). Contract AC09-76SR00001.

Published and unpublished in situ stress measurements and studies of earthquake focal mechanisms in the southeastern United States provide useful information on the relative magnitude and orientation of existing stress fields in the region. These data provide general agreement with the complex geology and the present-day tectonic processes observed in many areas of the southeastern United States. Stress measurements reveal the existence of high horizontal stresses in the Appalachian complex. The magnitude of the maximum horizontal stress ranged from 3.4 to 41.8 MPa. Different in situ stress states in the Appalachian complex, the Coastal Plain, and the stable interior region indicate the possibility for different faulting mechanisms. Data derived from the various techniques for determining in situ stress are consistent within the data scatter in each province.

58279 **Attenuation of shear-waves in the lithosphere for frequencies from 0.05 to 25 Hz.** Aki, K. (Massachusetts Inst. of Tech., Cambridge). *Physics of the Earth and Planetary Interiors;* **21**: 50-60(1980).

Q for shear-waves in the crust and upper mantle was determined as a function of frequency in the range 1 to 25 Hz, using band-pass filtered records of about 900 earthquakes occurring in the central Japan area with focal depths from 0 to 150 km. The data were supplied from two stations in the Kanto region, operated by the Earthquake Research Institute, University of Tokyo. The method is taken from Aki and Chouet and Rautian and Khalturin, and is based on elimination of the source effect from observed spectra of shear-waves, by taking the ratio of their amplitudes to those of coda-waves. The effect of radiation patterns is removed by averaging the ratio over many events. The experimental procedure uses basically a single-station method, and its validity was confirmed by the agreement between results obtained from station Tsukuba and those from Dodaira. Researchers found that Q shows a strong dependence on frequency: Q increases with frequency f proportionally to f/sup n/, where n was found to be 0.8 in the northeastern part of Kanto, and 0.6 in the rest of the region. Previously, a value for n of 0.5 had been determined for the Garm area in central Asia by Rautian and Khalturin. In general, our results agree with those of Fedotov and Boldyrev, who obtained values of n around 0.6 for the Kuril-Islands, using a single-station method based on assumptions more restrictive than those adopted here. Q values for the lithosphere have been estimated by various workers using surface-waves with periods greater than 15 s. If we combine the results from surface-waves with those obtained from the S- to coda-amplitude ratio, we find that the frequency-dependence of Q^{-1} is similar to that obtained from a simple relaxation model, with the peak somewhere around 0.5 Hz.

5803 Mineralogy, Petrology, And Rock Mechanics

58280 **(AERE-R—10046) Physical properties of granite relevant to near field conditions in a nuclear waste depository.** McLaren, J.R.; Titchell, I. (UKAEA Atomic Energy Research Establishment, Harwell. Materials Development Div.). Oct 1981. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701555.

This report presents results of the effects of heat and time at temperature on Young's modulus of granite pertinent to fission product heating in a depository for radioactive waste. In general, modulus remains constant at approximately 65 GPa to 60 to 80°C and then falls in nearly linear fashion to approximately 6 GPa at 550°C. This effect is ascribed to cracking due to differential thermal expansion between the constituent minerals or between differently oriented crystals of the same mineral. An attempt has been made to quantify the extent of cracking and hence calculate an increase in surface area exposed of between 10^0 and 10^3 m^2/m^3 of rock by heating to 200°C. The effects of overburden pressure have not been studied.

58281 **(ENPU—80-13) Geomechanical properties of rocks from the Altnabreac area.** McEwen, T.J.; Horseman, S.T.; Lai, S.F. (Institute of Geological Sciences, London (UK); Natural Environment Research Council, London (UK)). Jun 1980. 81p. NTIS (US Sales Only), PC A05/MF A01; Available from Environmental Protection Unit, Institute of Geological Sciences, Harwell Laboratory, Oxfordshire. Order Number DE82702205.

Laboratory test results are presented for core samples of Strath Halladale Granite and Moine metasediments from the Altnabreac Research Site in Caithness, Scotland. Properties measured include indirect tensile strength, uniaxial compressive strength, shear strength under triaxial confinement, stress-strain parameters, density and porosity. Strength data are interpreted using Hoek and Brown's (1980) empirical failure criterion which is found to provide an adequate fit to the failure envelopes. The rocks at the site have been classified using Deere and Millers' (1966) engineering classification system for intact rocks.

58282 **Laboratory measurements of ultralow permeability of geologic materials.** Trimmer, D. (Earth Science Division, University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Review of Scientific Instruments;* **53**: No. 8, 1246-1254(Aug 1982). Contract W-7405-ENG-48.

A new apparatus is described for determining permeability (water) in geologic materials as a function of confining pressure (to 200 MPa), pore pressure (to 25 MPa), and deviatoric stress (500—800 MPa). The samples are relatively large (0.15 m diameter x 0.28 m long) and may be intact or contain a single through-going fracture. Permeabilities of 10^{-11}—10^{-24} m^2 (10—10^{-12} D) may be measured, simultaneously, with electrical conductivity and acoustic velocity and amplitude. Crack closure is also monitored for the fractured samples. All experimental control and data-acquistion functions are performd by a microcomputer. A discussion of data-analysis techniques and typical data are also presented.

58283 **(DOE/ER/10412—T1) Thermally induced chemical migration in carbonate rocks. Final project report.** Papike, J.J. (State Univ. of New York, Stony Brook (USA). Dept. of Earth and Space Sciences). May 1982. Contract AC02-79ER10412. 19p. NTIS, PC A02/MF A01. Order Number DE82019096.

This investigation concerns the thermally induced transport of major, minor, and trace elements, and the use of rare earth elements (REE) as analogs for actinide element migration.

58284 **(ORNL—5874) Permeability of salt-crystal interfaces to brine.** Gilpatrick, L.O.; Baes, C.F., Jr.; Shor, A.J.; Canonico, C.M. (Oak Ridge National Lab., TN (USA)). Jun 1982. Contract W-7405-ENG-26. 17p. NTIS, PC A02/MF A01. Order Number DE82016580.

To investigate the movement of brine along grain boundaries in polycrystalline salt, measurements have been made of the radial flow of brine through the interface between cylindrical salt crystals under axial stresses to 140 bar and temperatures to 80°C. For constant conditions, the total flow of brine showed a linear dependence on the logarithm of time, and the reciprocal permeability increased linearly with time. Loss of salt from the interface by pressure solution effects was more than enough to account for the decrease in the apparent thickness of the interface (i.e., that which may be estimated for an interface of the same permeability formed by plane parallel surfaces). This apparent thickness, initially as large as 10 μm, decreased to as little as 0.2 μm with exposure to stress and flowing brine. It decreased quickly with sudden increases in axial stress and usually increased, though not reversibly, with decreases in stress. The rate of increase in the reciprocal permeability with time was roughly proportional to the stress and to the square of the hydraulic pressure drop. Assuming similar apparent thicknesses for the grain boundaries in polycrystalline salt, permeabilities are predicted that are quite consistent with the low values reported for stressed core specimens.

58285 **Concentration, vertical flux, and remineralization of particulate uranium in seawater.** Anderson, R.F. (Woods Hole Oceanographic Inst., MA). *Geochimica et Cosmochimica Acta;* **46**: No. 7, 1293-1299(Jul 1982).

Concentrations and fluxes of particulate U were measured throughout the water column at several locations in the Atlantic and Pacific Oceans with in situ filtration systems and sediment traps. The results indicate that dissolved U is fixed to particles in surface seawater. Organic matter appears to be the carrier phase. Formation of particulate authigenic U below the surface waters could not be detected. Authigenic U is remineralized within the bathypelagic layers at the open ocean sites studied. In the Panama Basin, an upwelling area with high biological productivity, remineralization of authigenic U in the deep sea is insufficient to produce a measurable concentration gradient between surface and deep waters within the mixing time of the oceans. Formation of authigenic U in the water column in areas such as the Panama Basin is not a significant sink for U on an ocean wide basis.

58286 **Interelement relationship in abyssal Pacific ferromanganese nodules and associated pelagic sediments.** Li, Y.-H. (Lamont-Doherty Geological Observatory, Palisades, NY). *Geochimica et Cosmochimica Acta;* **46**: No. 6, 1053-1060(Jun 1982).

By R-mode factor analysis and enrichment factor calculations, most of the elements in abyssal ferromanganese nodules and associated pelagic sediments (excluding common authigenic minerals like apatite, barite, opal and carbonates) are found to be preferentially concentrated in one of the following three major phases: aluminosilicates (e.g., Al, Si, Sc, Ga, Cr, Be, Na, K, Rb and Cs), Fe-oxides (e.g., Fe, P, S, V, Se, Te, As, B, Sn, U, Hg, Pb, Ti, Ge, Y, Zr, Nb, Pd, In, rare-earths, Hf, Th, Pa, Pu, Am, Ru and Bi), and Mn-oxides (e.g., Mn, Tl, Ag, Cd, Mg, Ca, Ba, Ra, Co, Ni, Cu, Zn, Mo, Sb and probably W). The specific association of elements with these three phases can be explained by the difference in chemical forms of elements in seawater and by fundamental differences in physiocochemical properties (e.g., the pH of zero point of charge and dieletric constant) of these three phases.

58287 **Concentration and pH dependence of calcium and zinc absorption by iron hydrous oxide gel.** Kinniburgh, D.G. (Univ. of Wisconsin, Madison); Jackson, M.L. *Soil Science Society of America Journal;* **46**: No. 1, 56-61(Jan 1982). CONTRACT AC02-76EV01515.

The specific adsorption of calcium (Ca) (pH 8.0) and zinc (Zn) (pH 5.5 and 6.5) by iron (Fe) gel in 1M $NaNO_3$ could be adequately described over three to five decades of concentration (c. 10^{-2}M to 10^{-7}M) by splitting the adsorption isotherm into one, two, or three regions and fitting the Freundlich isotherm to each region separately. Over the range of concentrations, $10^{-4}M < c < 10^{-2}M$, Zn adsorption at pH 6.5 was about 10 times greater than at pH 5.5. Zinc adsorption at pH 5.5 was about the same as Ca adsorption at pH 8.0. No adsorption maxima were found. At trace concentrations ($c < 10^{-7}M$) where the adsorption isotherm is linear, adsorption (x/m) may be described by the equation: $\log (x/m) = \log k_1 + n^*pH + \log c$, where k_1 and n^* are empirical constants derived from percent adsorption against pH data. Estimates of $\log k_1$ and n^* for trace adsorption of Ca, Sr, Ba, Co, Cu, Zn, Cd, Ag, Y, and Ce were derived from various sources. Naturally occurring iron oxides (and other hydrous oxides) could exert a significant control on Zn concentrations in soil solutions above about pH 6.0.

58288 **Rare-earth and other trace-element distributions in the calc-alkaline volcanic rocks from deep boreholes in the Phlegrean Fields, Campania (South Italy).** Albini, A. (CISE, Milano, Italy); Cristofolini, R.; Di Girolamo, P.; Stanzione, D. *Chemical Geology;* **28**: No. 1/2, 123-133(1980).

Lavas and other volcanic products have been found in boreholes at depths of 300 to 1900 m, in Campania. They underlie the volcanics of the potassic and highly potassic sequence of this region, and show geochemical and mineralogic features similar to those of the K-rich calc-alkaline volcanics. Five of these rocks, ranging from basalts to basaltic andesites and andesites, have been analyzed for REE and other trace elements; only REE have been determined in six other more altered rocks. The geochemical data for these rocks agree with their petrology, and are similar to those of the calc-alkaline volcanics found along continental margins, and also of some products of the active volcanic area in the Eolian Islands. The petrography and the major- and trace-element chemistry of these rocks show that they reached different fractionation stages (SiO_2 = 48 to 60%; SI = 33 to 20; Cr = 80 to 18 ppM; Ce = 15 to 44 ppM), but not along one definite line of descent, the rocks having probably been produced from slightly different parent magmas.

58289 **A bottom water intrusion in Onslow Bay, North Carolina.** Hofmann, E.E. (North Carolina State Univ., Raleigh); Pietrafesa, L.J.; Atkinson, L.P. *Deep-Sea Research, Part A: Oceanographic Research Papers;* **28A**: No. 4, 329-345(1981). Contract AS09-76EV00902;AS09-76EV00889.

During the period 20 July to 8 August 1976, a bottom intrusion of Gulf Stream water was observed in hydrographic data and data from moored current meters from Onslow Bay, North Carolina. The event was the result of southerly winds (upwelling favorable) and Gulf Stream meandering. Offshore (easterly) movement of the Gulf Stream causes an upward movement of isotherms which presents cold, saline water at the shelf break. Once this water is present at the shelf break, some other mechanism, such as southerly winds, is necessary for it to upwell into Onslow Bay. The extent of the upwelling is determined by the intensity and duration of the wind event.

58291 **(AD-A—109806/0) Role of the big flare syndrome in correlations of solar energetic proton fluxes and associated microwave burst parameters. Environmental research papers.** Kahler, S.W. (Air Force Geophysics Lab., Hanscom AFB, MA (USA)). 21 Sep 1981. 33p. (AFGL-TR—81-0280; AFGL-ERP—754). NTIS, PC A03/MF A01.

In previous studies correlating E > 10 MeV proton fluxes and spectra with various associated microwave burst parameters, the resulting high correlations were assumed to reflect a common acceleration process for the protons and the microwave-emitting electrons. We suggest and test an alternative explanation for these correlations, which we term the Big Flare Syndrome (BFS), that states that, statistically, energetic flare phenomena are more intense in larger flares, regardless of the detailed physics. Peak 1-8 A X-ray fluxes, characteristic of the thermal flare, are correlated with peak proton fluxes to derive correlation coefficients characteristics of the BFS. Of all microwave parameters tested for the 1973-1979 period, only the time-integrated flux densities at 8800 and 15400 MHz may be significantly larger than expected form the BFS. We fail to confirm previous results associating peak proton spectra with peak microwave spectral characteristics, thus finding no evidence that peak microwave fluxes are indicative of proton acceleration. We extend this conclusion to peak hard X-ray correlations. The strongly nonlinear relationship deduced between flare energy and proton production also appears invalid.

58292 (AD-A—110098/1) **Numerical studies of gravitational accretion from x-ray heated stellar winds. Doctoral thesis.** Lupo, J.A. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA)). Dec 1981. 153p. NTIS, PC A08/MF A01.

We present three numerical models of accretion from radiation driven stellar winds onto compact objects in massive X-ray binary systems. The wind is given a velocity profile consistent with a radiatively driven wind, and a 'negative mass' gravitational potential is derived from this profile to represent the wind driving force in the hydrodynamic equations. An X-ray heating model is used which determines the X-ray heating time from the Compton heating time and the known steady state energies for optically thin gas illuminated by X-rays. This allows X-ray heating to be included in the hydrodynamic equations. The X-ray luminosity is held proportional to the accretion rate, assuming that the gravitational potential energy released is equivalent to 10% of the infalling rest-mass energy. A two-dimensional Eulerian computer code is used to solve the equations of motion. Model estimates of the ionization structure, accretion rates and flow characteristics, and the effects of thermal instabilities are discussed. The impact of the X-ray radiation on the wind driving force is demonstrated. Results indicate a possible mechanism for slow X-ray flares, such as observed in 4U1700-37.

58293 (AD-A—111360/4) **Electron densities in a solar flare derived from x-ray spectra. Technical report.** McKenzie, D.L.; Broussard, R.M.; Landecker, P.B.; Rugge, H.R.; Young, R.M. (Aerospace Corp., El Segundo, CA (USA). Space Sciences Lab.). 15 Jan 1982. 19p. (TR—0082(2940-01)-1). NTIS, PC A02/MF A01.

We obtained high resolution solar x-ray spectra during the rising phase of a major solar flare between 0807 UT and 0905 UT on 1979 June 10. Measurements of the density sensitive line ratio, R, of the O VIII 1s squared (1) sub 0 - 1s 2s (3) S sub 1 (22.10 A) flux to the O VII 1s squared (1) S sub 0 - 1s 2p (3) P sub 1 (21.80 A) flux indicates that the density of the plasma at around 2 million K exceeded 10 to the 11th power per cu cm near the peak of the flare.

58294 (CEA-CONF—6027) **Acceleration of galactic cosmic rays in shock waves.** Lagage, P.O. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Div. de la Physique). Jun 1981. 4p. (In French). (CONF-8106224—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702010.

From La Baume Sainte Marie meeting; Aix-en-Provence, France (10 Jun 1981).

The old problem of the origin of cosmic rays has triggered off fresh interest owing to the discovery of a new model which enables a lot of energy to be transferred to a small number of particles on the one hand and the discovery of the coronal environment in which this transfer occurs, on the other. In this paper, interest is taken in the galactic cosmic rays and an endeavour is made to find out if the model can reveal the existence of cosmic rays over a wide energy range. The existence of an energy break, predicted by the model, was recognized fairly early but, in the literature, it varies from 30 GeV to 10^6GeV according to the authors. A study has been made of the two main causes of an energy break: the sphericity of the shock and the life time of the shock wave.

58295 (CEA-CONF—6030) **Spectral observation of the soft x-ray background and of the north polar spur with solid state spectrometers.** Rocchia, R.; Arnaud, M.; Blondel, C.; Cheron, C.; Christy, J.C.; Ducros, R.; Koch, L.; Rothenflug, R.; Schnopper, H.W.; Delvaille, J.P. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Div. de la Physique). Jun 1981. 5p. (CONF-8106229—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702258.

From 15. ESLAB symposium on x-ray astronomy; Amsterdam, Netherlands (22 Jun 1981).

In this paper, we present spectral measurements of the soft X-ray ($E < 1$ keV) background obtained with 3 cooled Si (Li) solid state detectors during the flight of a spin-stabilized rocket.

58296 (IN2P3—80-9-Vol.1) **Grand unified theories and their cosmological consequences.** Barloutaud, R.; Cavaignac, J.F.; Nanopoulos, N. (Institut National de Physique Nucleaire et de Physique des Particules, 75 - Paris (France)). Sep 1980. 122p. (In English and French). NTIS (US Sales Only), PC A06/MF A01. Order Number DE82903810.

Portions of document are illegible.

These lectures contain a rather lengthy study of Grand Unified Theories as applied both in particle physics and in cosmology. Section I contains some basic points concerning the structure of the standard strong and electroweak interactions prior to grand unification. Sections II and III include the basic principles of GUTS in general. Section IV is devoted to a rather detailed study of the structure and the physics of several leading grand unified models like SU(5), 0(10) and E_6. Finally section V contains the most important cosmological implications of GUTS, including baryon number generation in the early Universe, dissipative processes in the very early Universe, Grand Unified monopoles, a cosmological lower bound on the neutron electric dipole moment, etc.

58299 (LA-UR—82-1945) **Short-timescale variability in cataclysmic binaries.** Cordova, F.A.; Mason, K.O. (Los Alamos National Lab., NM (USA); University Coll., London (UK). Mullard Space Science Lab.). 1982. Contract W-7405-ENG-36. 16p. (CONF-8206101—1). NTIS, PC A02/MF A01. Order Number DE82019569.

From Conference on pulsations in classical and cataclysmic variable stars; Boulder, CO, USA (1 Jun 1982).

Portions of document are illegible.

Rapid variability, including flickering and pulsations, has been detected in cataclysmic binaries at optical and x-ray frequencies. In the case of the novalike variable TT Arietis, simultaneous observations reveal that the x-ray and optical flickering activity is strongly correlated, while short period pulsations are observed that occur at the same frequencies in both wavelength bands.

58300 (LBL—14513) **Recent results from the Bevalac.** Pugh, H.G. (Lawrence Berkeley Lab., CA (USA)). Jun 1982. Contract AC03-76SF00098. 28p. (CONF-8205102—3). NTIS, PC A03/MF A01. Order Number DE82020128.

From Workshop on quark matter formation and heavy ion collisions; Bielefeld, F.R. Germany (10 May 1982).

In a collision between a 1.8 GeV/amu argon ion and a lead target, the overlapping regions of projectile and target undergo violent interaction while the non-overlapping regions either continue with beam velocity and break up into projectile fragments or remain at rest and break into target fragments. Projectile fragements are the easiest to study; the participants, in the mid-rapidity region, are the next easiest, while the target fragments have not been extensively studied, except by radiochemistry techniques. This talk concentrates (with the exception of a discussion of anomalous projectile fragments) on the participant region, where one would expect to find high densities and temperatures and where evidence of any phase transition might be found. The extensive evidence for a high degree of equilibration at Bevalac energies is omitted, even though the stopping power of nuclei is crucial for possible studies at higher energies.

58301 **(NASA-TM—83849) Magnetic clouds between 2-4 AU: Voyager observations.** Burlaga, L.F.; Behannon, K.W. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Oct 1981. 26p. NTIS, PC A03/MF A01.

Magnetic clouds were observed in the solar wind between 2-4 AU. It was shown that they are stable enough to persist without major changes out to such distances. It is estimated that the clouds expand at a speed of the order of 45 km/s. The average Alfven speed at the front and rear boundaries is 104 km/s, the expansion speed is estimated to be nearly half of the Alfven speed, which is consistent with an earlier estimate of the expansion speed of clouds between the Sun and 1 AU. The magnetic field configuration is highly ordered and consistent with the passage of some kind of loop.

58302 **(NDRE/PUBL—81/1002) Spacecraft and stellar occulations by turbulent planetary atmospheres: a theoretical investigation of various wave propagation effects and their impact on derived profiles of refractivity, temperature, and pressure.** Haugstad, B.S. (Forsvarets Forskningsinstitutt, Kjeller (Norway)). May 1981. 75p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE82903432.

The long propagation paths involved in radio and stellar occultations by turbulent planetary atmospheres require that the classical, weak scattering scintillation theory be expanded to account for the inhomogeneous ambient atmosphere upon which the turbulence is superimposed. Such coupling between the turbulent and the ambient components of refractivity reduces the scintillation index by less than a factor of two in shallow radio occultations. For stellar occultations the reduction varies between this value for very small projected stellar radii, to approximately a factor of 3.6 when the projected stellar radius above the planetary limb greatly exceeds the radius of the free-space Fresnel zone at this distance. More profound changes are found in the scintillation power spectrum, the shape of which depends strongly on both occultation depth and geometry when coupling to the inhomogeneous background is properly accounted for. Second-order, systematic propagation effects calculated from both geometrical optics and a wave-optical formulation show that the average phase velocity is increased in the presence of turbulence. The finite (γ^{-}/sup 1/6/) wavelength dependence of the phase path bias implies that an initially non-dispersive medium becomes slightly dispersive by the addition of turbulence. Atmospheric profiles derived from occultations by turbulent planetary atmospheres differ only slightly from those of the corresponding non-turbulent atmosphere when the weak scattering condition is satisfied. Even so, there is strong indication that profiles obtained from radio Doppler measurements are much less affected by turbulence than those from radio or stellar intensity measurements. Systematic errors in refractivity, temperature and pressure are all small for either kind of measurement in the limit of weak scattering. Radio and stellar occultations, when properly conducted and interpreted, are a potential source of information also on turbulence strength, bulk flow scales, planetary rotation and atmospheric winds.

58303 **(PB—82-153040) Solar-geophysical data number 445, September 1981. Part II (comprehensive reports). Data for March 1981, January 1980, and miscellanea.** Coffey, H.E. (National Geophysical and Solar-Terrestrial Data Center, Boulder, CO (USA)). Sep 1981. 100p. (SGD—445-PT-2). NTIS, PC A05/MF A01.

In addition to an index for 1980-1981, this issue of comprehensive reports provides data for March 1981 on: solar radio emission, solar x-ray radiation and mass ejections from the sun. A new schedule will cause the daily flare index and the regional flare index to appear 13 and 14 months from the date of observation. This issue contains January 1980 solar flares. It also contains the regional flare index for December 1979.

58304 **(PB—82-171083) Solar-geophysical data number 446, October 1981. Part II (comprehensive reports). Data for April 1981, and miscellanea.** Coffey, H.E. (National Geophysical and Solar-Terrestrial Data Center, Boulder, CO (USA)). Oct 1981. 92p. (SGD—446-Pt-2). NTIS, PC A05/MF A01.

In addition to an index for 1980-1981, this issue of comprehensive reports provides data for April 1981 on: solar radio emission, solar x-ray radiation, and mass ejections from the sun. A new schedule will cause the daily flare index and the regional flare index to appear 13 and 14 months from the date of observation. This issue contains active regions from 9 February - 4 April 1981, synoptic solar maps 9 February - 4 April 1981 and the International Geophysical Calendar for 1982.

58305 **(PB—82-177734) Solar-geophysical data number 447, November 1981. Part II (comprehensive reports). Data for May 1981, February 1980 and miscellanea.** Coffey, H.E. (National Geophysical and Solar-Terrestrial Data Center, Boulder, CO (USA)). Nov 1981. 84p. (SGD—447-PT-2). NTIS, PC A05/MF A01.

In addition to an index for 1980-81, this issue of comprehensive reports provides data for May 1981 on: solar radio emission, solar x-ray radiation and mass ejections from the sun. Solar flares for February 1980 are given including the daily flare indices. Miscellaneous data includes active regions 4 April - 1 May 1981 and Synoptic solar maps 4 April - 1 May 1981.

58306 **(PB—82-179706) The white light solar corona--an atlas of k-coronameter synoptic charts August 1980 - September 1981. Technical note.** Fisher, R.; Garcia, C.; Rock, K.; Seagraves, P.; Yasukawa, E. (National Center for Atmospheric Research, Boulder, CO (USA)). Jan 1982. 126p. (NCAR/TN—188). NTIS, PC A07/MF A01.

A synoptic observing program was undertaken at the Mauna Loa Solar Observatory, a site operated by the High Altitude Observatory to study the solar corona using the Mark III K-Coronameter. Daily pB images were used to extract three pB ( ) azimuthal scans located at heights of 1.3, 1.7, and 2.1 Rq. Four final data products are given in this atlas: (1) interpolated pB contour plots for h = 1.3 and 1.7 Rq for each Carrington rotation; (2) shaded pB charts for each Carrington rotation; (3) standard zonal pB average values for each day; and (4) autocorrelation estimates of pB variation for equatorial and high latitude structure and an autocorrelation coefficient for an amplitude-independent, first moment of the pB distribution.

58307 **Ultrahigh-energy cross section from study of longitudinal development of air showers.** Ellsworth, R.W.; Gaisser, T.K.; Stanev, T.; Yodh, G.B. (Department of Physics, George Mason University, Fairfax, Virginia 22030). *Physical Review [Section] D: Particles and Fields;* **26**: No. 1, 336-339(1 Jul 1982). Contract AC02-78ER05007.

We present calculations of the type that will be necessary for interpretation of large cosmic-ray experiments that measure longitudinal profiles of individual showers. A primary goal of such experiments is to determine both cross section and composition around 10^{18} eV.

58308 **Two-second variability in AM Herculis binaries.** Middleditch, J. (Los Alamos National Laboratory). *Astrophysical Journal, Letters to the Editor;* **25**: No. 72, L71-L75(15 Jun 1982).

AN UMa and the newly identified AM Her star E1405—451 both show excesses of optical variability in the broad frequency range from 0.4 to 0.8 Hz (2.5—1.25 s). The optical fluxes from AN UMa and E1405—451 must vary by 2.4% and 1.2% rms, respectively, in order to produce the level of noise observed in the power spectra. The noise is not produced during any one section of time or orbital phase but is approximately a constant proportion of the net optical light from E1405—451. The feature is possibly bimodal in AN UMa with a minimum of power at 0.65 Hz. Time series observations of AM Her made during both its "bright" and "faint" phases show that no such noise feature is present to less than 0.25% and 1.3% rms of the stellar light. The predictions of a model for this phenomenon, recently advanced by Langer, Chanmugam, and Shaviv and based on a thermal instability in the height of a standoff accretion shock, are tested with inconclusive results.

58309 **Formation of galaxies in a gravitino-dominated universe.** Bond, J.R.; Szalay, A.S.; Turner, M.S. (Physics Department, Stanford University, Stanford, California 94305). *Physical Review Letters;* **48**: No. 23, 1636-1640(7 Jun 1982). Contract AC02-80ER10773.

If gravitinos of mass 1 keV (or similar particles) dominate the mass of the universe, a critical scale of galactic size arises due to their collisionless phase mixing. It is shown that density perturbation spectrum of gravitinos is relatively flat between galactic and cluster scales, unlike the massive neutrino case. If gravitinos form the dark matter, initial adiabatic fluctuations lead to a hierarchical picture of clustering. Galaxies form first, but dissipation is necessary for their survival.

58310 **Reheating an inflationary universe.** Albrecht, A.; Steinhardt, P.J.; Turner, M.S.; Wilczek, F. (Department of Physics, University of Pennsylvania, Philadelphia, Pennsylvania 19104). *Physical Review Letters;* **48**: No. 20, 1437-1440(17 May 1982). Contract AC02-80ER10773.

The evolution of the Higgs expectation value is numerically analyzed and the temperature of the universe during the symmetry-breaking phase transition in an SU(5) theory with radiatively induced symmetry breaking. There is sufficient inflation (exponential expansion) shown to explain the cosmological homogeneity, isotropy, flatness, and monopole puzzles, and also that the universe reheats to a temperature $0(10^{14}$ GeV) so that the usual scheme for baryogenesis can proceed.

58311 **Precise source locations of the anomalous 1979 March 5 Gamma-ray transient.** Cline, T.L.; Desai, U.D.; Teegarden, B.J.; Evans, W.D.; Klebesadel, R.W.; Laros, J.G.; Barat, C.; Hurley, K.; Niel, M.; Vedrenne, G.; Estulin, I.V.; Kurt, V.G.; Mersov, G.A.; Zenchenko, V.M.; Weisskopf, M.C.; Grindlay, J. (Laboratory for High Energy Astrophysics, NASA Goddard Space Flight Center, Greenbelt, Maryland 20771). *Astrophysical Journal, Letters to the Editor;* **255**: No. 1, L45-L48(1 Apr 1982).

Refinements in the source direction analysis of the observations of the unusual 1979 March 5 gamma-ray transient are presented. The final results from the interplantary gamma-ray burst network produce a 0.1 arcmin^2 error box. It is nested inside the initially determined 2 arcmin^2 source region of Evans et al. that identified the supernova remnant N49 in the Large Magellanic Cloud as a possible source. This smaller source location is within both the optical and X-ray contours of N49 although not positioned at either contour center.

58312 **Lepton number violation, Majorana neutrinos, and supernovae.** Kolb, E.W.; Tubbs, D.L.; Dicus, D.A. (Los Alamos National Laboratory, University of California). *Astrophysical Journal, Letters to the Editor;* **255**: No. 1, L57-L61(1 Apr 1982).

Weak interaction theories with Majorana masses for neutrinos have lepton number violating reactions. We consider gravitational collapse of massive stars in such a model and find that if the lepton nonconserving reactions occur, the dynamics of collapse will be drastically different from the low-entropy collapse that follows from the usual assumption of lepton number conservation.

58313 **Maximum extent of flash-driven convection II. The core flash.** Despain, K.H. (Department of Astronomy, Haverford College, Haverford, Pennsylvania; and Theoretical Division, Los Alamos Scientific Laboratory). *Astrophysical Journal;* **253**: No. 2, 811-815(15 Feb 1982).

It is demonstrated that the maximum extent of the flash-driven convective region during the core helium flash is determined by the condition tau/sub d/roughly-equaltau/sub e/, where tau/sub d/ is the radiative diffusion time from the outer edge of the convective region to the outer envelope and tau/sub e/ is the growth time scale for the thermal runaway. This is the same condition that obtains in shell flashes. Numerical experiments with enhanced flashes have been performed in which the convective region approaches but does not penetrate the hydrogen shell though the approach is close enough that overshooting may lead to mixing. The possibility of such enhanced flashes actually occurring is also discussed.

58314 **Mixed lattice phases in cold dense matter.** Jog, C.J.; Smith, R.A. (Department of Physics, State University of New York at Stony Brook). *Astrophysical Journal;* **253**: No. 2, 839-841(15 Feb 1982). Contract AC02-76ER13001.

Over a wide density range, the ground state of cold neutral matter in the absence of external magnetic fields is a degenerate sea of electrons containing a lattice of nuclei. In certain density regions, a phase composed of interpenetrating cubic lattices of different nuclides is preferable to a body-centered cubic lattice of any single nuclide. The arguments supporting this result are first made assuming the electrons to be a uniform background; the qualitative features remain when screening and exchange effects are included.

58315 **Apollo 12 feldspathic basalts 12031, 12038 and 12072 - Petrology, comparison and interpretations.** Beaty, D.W. (California Institute of Technology, Pasadena, Calif.); Hill, S.M.R. (California University, Los Alamos Scientific Laboratory, Los Alamos, N. Mex.). pp 115-139 of Lunar and planetary science conference, 10th, Houston, Tex., March 19-23, 1979, proceedings. Volume 1. New York, NY; Pergamon Press (1979).

From 10. lunar and planetary science conference; Houston, TX, USA (19 Mar 1979).

The paper presents the petrology of Apollo 12 feldspathic basalts. Modal and chemical data indicate that basalts 12072, 12038, and 12031 cannot be related to the other Apollo rock types 12072 contains phenocrysts of olivine and pigeonite, 12038 is a multiply saturated equigranular basalt, and 12031 is a coarse-grained rock with granular to graphic intergrowths of pyroxene and plagioclase. The bulk compositions indicate that these basalts could not have been derived from the Apollo 12 olivine or ilmenite basalts by crystal-liquid fractionation, and their petrologic similarities suggest that they were produced in the same or similar source regions.

58316 **Non-equilibrium effects on the chemistry of nebular condensates: implications for the planets and asteroids.** Blander, M. (Argonne National Laboratory, Argonne, Ill.). pp 809-821 of Asteroids. Gehrels, T. Tucson, AZ; Arizona University (1979).

Kinetic effects, for example nucleation constraints and slow reactions, should have been important in nebular condensation. Consideration of these effects leads to the prediction of pressure-dependent compositions and physical properties of nebular condensates which is consistent with (1) the differences between different classes of chondritic meteorites, (2) some of the differences between planets, and (3) the presence of oxidized iron on the moon and in the eucrite parent body (presumably an asteroid) despite the low abundance of volatiles. Diffusion effects appear to be important for understanding oxygen isotope anomalies in refractory inclusions in Allende. The consideration of kinetic effects leads to more information concerning nebular processes than if equilibrium is assumed.

REFER ALSO TO CITATION(S) 58056, 58056, 58301

58317 **(AD-A—108800/4) Influence of velocity shear on the Rayleigh-Taylor instability. Memorandum report.** Guzdar, P.N.; Satyanarayana, P.; Huba, J.D.; Ossakow, S.L. (Naval Research Lab., Washington, DC (USA)). 16 Dec 1981. 27p. (NRL-MR—4701). NTIS, PC A03/MF A01.

The influence of a transverse velocity shear on the Rayleigh-Taylor instability is investigated. It is found that a sheared velocity flow can substantially reduce the growth rate of the Rayleigh-Taylor instability in the short wavelength regime (i.e., $kL > 1$ where L is the scale length of the density inhomogeneity), and causes the growth rate to maximize at $kL < 1.0$. Applications of this result to ionospheric phenomena (equatorial spread F (ESF) and ionospheric plasma clouds) are discussed. In particular, the effect of shear could account for, at times, the 100's of km modulation observed on the bottomside of the ESF ionosphere and the km scale size wavelengths observed in barium cloud prompt striation phenomena.

58318 (AD-A—109683/3) Analysis of nuclear propagation effects utilizing wideband satellite data. Final report, 14 January 1980-30 January 1981. Rino, C.L.; Owen, J.; Livingston, R.C. (SRI International, Menlo Park, CA (USA)). 1 Apr 1981. 90p. NTIS, PC A05/MF A01.

Previous analyses of the Wideband Satellite data have emphasized the scale-size regime between 500 m and several tens of kilometers. In this report we describe the results of a detailed analysis of the auroral and equatorial total electron content (TEC) structure associated with the various scintillation phenomena. A nighttime equatorial anomaly was a prominent feature in the equatorial data, particularly as the solar cycle maximum approached. In the auroral data we found that an enhanced F region is the primary contributor to steep latitudinal TEC gradients. Because recent data have shown an abrupt steepening of the irregularity spectral density function near 500 m, a careful analysis of the mutual coherence function was performed to see if this feature could be detected in the Wideband scintillation data. The analysis did indeed reveal such a feature, which is evidently a permanent characteristic of the most severely disturbed equatorial irregularity continuum.

58319 (AD-A—109685/8) Equatorial plasma bubbles: vertically elongated wedges from the bottomside F layer. Technical report. Tsunoda, R.T.; Livingston, R.C. (SRI International, Menlo Park, CA (USA)). 1 Apr 1981. 50p. NTIS, PC A03/MF A01.

We address the question regarding the two-dimensional shape of equatorial plasma bubbles in the plane transverse to the geomagnetic field. By comparing the east-west spatial relationship of ion-density depletions measured insitu by the Atmospheric Explorer-E (AE-E) satellite to backscatter plumes measured by the ALTAIR radar, we show that plasma bubbles are vertically elongated depletions that extend upward from the bottomside of the F layer, in the form of wedges, rather than more isotropically shaped but isolated structures. The shape of plasma bubbles is inferred from (1) ion-density depletions that exceeded 99 percent in the 'neck' regions of plumes, and (2) the eastward drift velocities of the plumes. The expected electrodynamics of vertically elongated plasma bubbles are consistant with the observations of large eastward drift velocities of plumes that are comparable to the F-region plasma drift measurements made at Jicamarca and to F-region neutral wind measurements made at Kwajalein. The results also reveal that the west wall of large-scale altitude modulations of the bottomside F layer that produces the primary plumes and bubbles becomes structured, and evolves with the generation of secondary plumes and bubbles.

58320 (AD-A—109831/8) Time-dependent three-dimensional simulation of the earth's magnetosphere: reconnection events. Memorandum report. Brecht, S.H.; Lyon, J.G.; Fedder, J.A.; Hain, K. (Naval Research Lab., Washington, DC (USA)). 22 Dec 1981. 41p. (NRL-MR—4690). NTIS, PC A03/MF A01.

This paper presents the results of a 3-D simulation of the earth's magnetosphere. The simulation region covered -100 Re < or = x < or = 30 Re, (Y) < or = 40 Re and (Z) < or = Re. The solar wind parameters were Bz = -2 gamma, density of 5 cc and velocity of 400 km/sec. The results show the existence of multiple x-points in the tail. Strong plasma flow is seen to exist in both earthward and tailward directions during formation of neutral lines. The exact magnetic field and plasma behavior is found to be very position dependent.

58321 (AD-A—109894/6) Analysis of project EXCEDE II circular variable filter spectrometer data. Scientific report No. 1, 1 Jul 79-30 Sep 81. Grieder, W.F.; Foley, C.I. (Boston Coll., Chestnut Hill, MA (USA). Mass Space Data Analysis Lab.). 1 Jan 1981. 150p. (BC-SDAL—80-3). NTIS, PC A07/MF A01.

EXCEDE II is the fourth in a series of research experiments conducted by Air Force Geophysics Laboratory (AFGL) to study the infrared emission processes induced by rocketborne electron accelerators. The excitation of the upper atmosphere by the electron beam simulates aurora induced processes but provides the advantage that the dosing is more precisely quantified than in the natural auroral case. In addition, optical/infrared instruments carried onboard the same payload with the accelerator provide controlled viewing geometry of the induced emissions and measurements do not suffer from long path atmospheric attenuation as would be the case for some ground based observations.

58322 (AD-A—110051/0) Barium cloud test in Peru. Interim report Mar-Apr 79. Johnson, A.L.; Swanson, R.L. (Air Force Wright Aeronautical Labs., Wright-Patterson AFB, OH (USA)). Nov 1981. 24p. (AFWAL-TR—81-1178). NTIS, PC A02/MF A01.

In an effort to investigate the mechanism causing ionospheric irregularities to form in the equatorial region an experiment was designed by the Max Planck Institute involving the release of two barium clouds in the F region just after sunset. The electric field resulting from the two barium clouds was expected to trigger an ionospheric irregularity which would propagate up through the ionosphere as a depletion bubble. This report describes an attempt to observe the ionospheric irregularity as it passed through the line-of-sight between an aircraft and a communication satellite. The aircraft was equipped with a UHF receiver which measured phase and amplitude of the downlink Satellite Signal. Due to the release of the barium 50 km below the planned altitude no significant ionospheric irregularities were formed. The aircraft measured minor amplitude variation (1dB) and no significant phase variations resulting from ionospheric irregularities triggered by the barium release.

58323 (AD-A—110228/4) Fission beta particles emitted into the geomagnetosphere. Memorandum report. Bendel, W.L. (Naval Research Lab., Washington, DC (USA)). 23 Dec 1981. 20p. (NRL-MR—4712). NTIS, PC A02/MF A01.

The spectrum of electrons emitted into the earth's magnetic field by an exoatmospheric nuclear burst is considerably more energetic than the spectrum of all delayed electrons from fission, a spectrum often used. A better electron spectrum for general use is presented. Some items are calculated, including a depth-dose curve, and the two spectra are compared.

58324 (AD-A—111266/3) Anomalous resistivity of auroral field lines. Interim report. Rowland, H.L.; Palmadesso, P.J.; Papadopoulos, K. (Naval Research Lab., Washington, DC (USA)). 25 Jan 1982. 9p. (NRL—8537). NTIS, PC A02/MF A01.

Conditions that exist along auroral field lines (del n/sub i// n_0 > 0.24 Omega/sub e//omega/sub > 1/) act to break the adiabatic invariance of the electron magnetic moment, cause strong anomalous dc resistivity, and generate electron distributions in good agreement with observations.

58325 (AD-A—111452/9) Ionospheric irregularity physics modelling. Memorandum report. Ossakow, S.L.; Keskinen, M.J.; Zalesak, S.T. (Naval Research Lab., Washington, DC (USA)). 9 Feb 1982. 53p. (NRL-MR—4741). NTIS, PC A04/MF A01.

Theoretical and numerical simulation techniques have been employed to study ionospheric F region plasma cloud striation phenomena, equatorial spread F phenomena, and high latitude diffuse auroral F region irregularity phenomena. Each of these phenomena can cause scintillation effects. The results and ideas from these studies are state-of-the-art, agree well with experimental observations, and have induced experimentalists to look for theoretically predicted results. One conclusion that can be drawn from these studies is that ionospheric irregularity phenomena can be modelled from a first principles physics point of view. Theoretical and numerical simulation results from the aforementioned ionospheric irregularity areas will be presented.

58326 (AD-A—111456/0) The s3-4 ionospheric irregularities satellite experiment: probe detection of multi-ion component plasmas and associated effects on instability processes. Memorandum report. Szuszczewicz, E.P.; Holmes, J.C.; Singh, M. (Naval Research Lab., Washington, DC (USA)). 11 Feb 1982. 31p. (NRL-MR—4728). NTIS, PC A03/MF A01.

The pulsed plasma probe technique has been expanded to include simultaneous determinations of absolute electron density, density fluctuations, electron temperature, and mean ion mass with resolution limited only by probe geometry, sheath size, and telemetry. The technique has been designed to test for coupling of electron density variations and ion composition irregularities in multi-component plasmas by the comparison of electron density fluctuation power spectra PN(k) and a newly developed diagnostic parameter, the mean ion mass fluctuation spectra Delta M sub i bar/M sub i bar approaches the limit of P sub M(k). In addition, the experiment extends satellite-borne irregularity spectral analyses down to the 5-20 meter range while attempting to synthesize F-region plasma instability processes on the basis of N sub e, T sub e Delta N sub e, P sub N and P sub M. Initial results demonstrate the expanded diagnostic capability for high spatial resolution measurements of mean ion mass and provide experimental evidence for the role of ion composition in multi-stepped plasma instability processes. Limited analyses of the two power spectral elements raises hopes for the differential between plasma mechanisms that can lead to similar indices in PN.

58327 **(AERONOMICA-ACTA-A—221-1980) The internal structure of the magnetopause.** Roth, M. (Institut d'Aeronomie Spatiale de Belgique, Brussels). 1980. 345p. (In several languages). Institut d'Aeronomie Spatiale de Belgique, Brussels.

A kinetic model which describes the internal structure of the magnetopause is developed. Among other factors, the model takes into account the interplanetary magnetic field and the thermal motion of the particles. The structure of a tangential discontinuity in a multicomponent collisionless plasma is described. From consideration of the two-stream instabilities, a minimum magnetopause thickness is deduced. In a hydrogen plasma, this structure corresponds to an ionic layer in which the electric current is only the result of a displacement of ions. The tangential discontinuities observed at the magnetopause are likened to regions where magnetosheath and magnetospheric plasmas are interpenetrated. Quantitative results show that the variations of the different physical factors are analogous to those of satellite observations. More generally, the parameters characterizing this model make it appropriate to describe many types of tangential discontinuities which are likely to appear in other cosmic collisionless plasmas.

58328 **Nonlocal theory of an electrostatic sinusoidal density drift instability.** Thomsen, M.F.; Gary, S.P. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Geophysical Research;* **87**: No. A5, 3551-3560(1 May 1982).

The stability of space plasmas in which the macroscopic variables vary in the direction 1 perpendicular to the magnetic field is usually studied by means of the local approximation, in which the fluctuating potential is assumed to be independent of x. To remove this approximation, we study a nonlocal problem in which the background density, and hence the fluctuating potentials, are periodic in x. From the linear Vlasov/Poisson equations we derive a set of coupled, linear, homogeneous, algebraic equations relating the Fourier amplitudes of the eigensolution. We solve the equations numerically and find a hierarchy of exact eigenmodes characterized by different growth rates and spatial structures. At points where the density gradients is locally zero, the mode amplitude is generally several orders of magnitude lower than the peak amplitude. We study the dependence of these solutions on the parameters which define the background density perturbation and demonstrate a correspondence between these nonlocal results and those obtained with the local approximation. This allows us to illuminate the conditions under which the local theory is a valid approximation and permits us to extend its range of useful application.

58329 **Evidence for quasi-stationary reconnection at the dayside magnetopause.** Gosling, J.T.; Asbridge, J.R.; Bame, S.J.; Feldman, W.C.; Paschmann, G.; Sckopke, N.; Russell, C.T. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Geophysical Research;* **87**: No. A4, 2147-2158(1 Apr 1982).

Several highly unusual encounters with the earth's magnetopause occurred during an ~5-hour period on November 22—23, 1979, when the ISEE 1 and 2 satellites were near orbit apogee (~22.2 R/sub E/) at ~0900 local time. These distant magnetopause crossings corresponded to a subsolar earth-magnetopause distance of ~20.4 R/sub E/ and were associated with a drop in solar wind dynamic pressure to a value (~1.4 x 10^{-10} dynes cm^{-2})~100 times lower than is typical. Accelerated plasma flows whose magnitude and direction were consistent with the predictions of reconnection theory were observed on each of several satellite enecounters with the magnetopause and boundary layer during this 5-hour period. Further, the field variation through the magnetopause layer suggest that the magnetopause had the structure of a rotational discontinuity as required by reconnection theory. These observations thus indicate that on occasion reconnection at the dayside magnetopause can be a quasi-stationary process. Geomagnetic activity during this 5-hour period, and for at least 9 hours thereafter, was extremely low. Thus dayside reconnection is certainly not a sufficient condition for enhanced geomagnetic activity.

58330 **Plasma and magnetic field characteristics of magnetic flux transfer events.** Paschmann, G.; Haerendel, G.; Papmastorakis, I.; Sckopke, N.; Bame, S.J.; Gosling, J.T.; Russell, C.T. (Max-Planck-Institut fuer Physik und Astrophysik, Institut fuer extraterrestrische Physik, 8046 Garching, West Germany). *Journal of Geophysical Research;* **87**: No. A4, 2159-2168(1 Apr 1982).

Plasma and magnetic field data from ISEE 1 and 2 are examined for 5 passes of the magnetopause region at 20°—40° northern latitudes and ~0800 to 1215 hours local time. These intervals contained a total of 15 well-defined magnetic flux transfer events, which occurred in the magnetosheath as well as the magnetosphere. In either case, flux transfer events are characterized by a mixture of magentosheath and magnetospheric particles. This fact strongly supports the hypothesis that flux transfer events represent encounters of reconnected flux tubes. Inside all of the studied events, the magnetic field strength as well as the sum of plasma and magnetic pressures is strongly enhanced. This excess pressure appears to be balanced by the tension of the ambient magnetic field lines as they are draped around the reconnected flux tube. The different observed magnetic field signatures are consistent with expectations for encounters of the flux tubes at different relative locations. Only those events that appear to be crossings of the flux tube close to its magnetopause crossing show large (~100 km s^{-1}) plasma flow speed ehnancements. These increased velocities are restricted to the trailing portion of the events and are directed at large angles with respect to the magnetic field. One hypothesis is that the increased flow speeds are caused by continued reconnection at the low-latitude boundaries of the flux tubes.

58331 **Global Pc 5 event of November 14—15, 1979.** Higbie, P.R.; Baker, D.N.; Zwickl, R.D.; Belian, R.D.; Asbridge, J.R.; Fennell, J.F.; Wilken, B.; Arthur, C.W. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Geophysical Research;* **87**: No. A4, 2337-2346(1 Apr 1982).

Large-amplitude Pc 5 waves with 7—8 min quasi-periodic variations were observed almost continuously for the 48 hours of November 14—15, 1979, by several spacecraft in or near geostationary orbit on the dayside portions of their orbits. The waves were observed as large modulations in both the electron and ion fluxes over a wide range of energies (~1 to 500 keV) by the spacecraft 1976—059, 1977-007, 1979-053, P78-2, and GEOS 2 and as magnetic field peak-to-peak modulations of 15—25 γ by the P78-2 and GOES 2 and 3 magnetometers. The remarkably long persistence of these waves contrasts substantially with observations of typical flux modulation events which usually last less than 1 hour and which typically show little modulation of the > or =150 keV proton fluxes. Data taken concurrently by the ISEE spacecraft in the solar wind and outer magnetosphere indicate that the solar wind also had unusually properties. ISEE 3 measurements indicate that the solar wind velocity (~350 km/s) and density (~2 cm^{-3}) were simultaneously very low for this period. The alpha-to-proton ratio for the solar wind plasma attained an extremely low value (<1%) early in the event. These solar wind properties imply such a much reduced dynamic pressure on the magnetosphere during this period. Consequently, the ISEE 1 and 2 spacecraft passed through the magnetopause at the uncommonly large radial distance of 18 R/

sub E/ at ~0830 local time where the typical magnetopause geocentric distance is 12 R/sub E/. The exceptional solar wind and outer magnetospheric conditions may have determined the unusual properties of the ULF event observed near geostationary orbit. Some candidate mechanisms for producing these oscillations are presented, but no definitive explanation for this event can be given at present.

58332 **Dissipation of ionospheric irregularities by wave-particle and collisional interactions.** Bernhardt, P.A.; Pongratz, M.B.; Gary, S.P.; Thomsen, M.F. (Los Alamos National Laboratory, University of California, Los Alamos, New Mexico 87545). *Journal of Geophysical Research;* **87**: No. A4, 2356-2363(1 Apr 1982).

The nonlinear dissipation of plasma irregularities aligned parallel to an ambient magnetic field is studied numerically using a model which employs both wave-particle and collisional diffusion. A wave-particle diffusion coefficient derived from a local theory of the universal drift instability is used. This coefficient is effective in regions of nonzero plasma gradients and produces triangular-shaped irregularities with spectra which vary as f^{-4}, where f is the spatial frequency. Collisional diffusion acts rapidly on the vertices of the irregularities to reduce their amplitude. The simultanteous action of the two dissipative processes is more efficient than collisions acting alone. In this model, wave-particle diffusion mimics the forward cascade process of wave-wave coupling.

58333 **The magnetopause layer and plasma boundary layer of the magnetosphere.** Eastman, T.E. (EG and G, Inc., Los Alamos, N. Mex.); Hones, E.W., Jr. (California, University, Los Alamos, N. Mex.). pp 401-411 of Quantitative modeling of magnetospheric processes. Washington, DC; American Geophysical Union (1979).

Satellite coverage of the sunward magnetopause and plasma boundary layer (PBL) are shown schematically and discussed for four satellites that include both plasma and field measurements. Plasma observations from the VELA satellites first established the continued presence of magnetosheath-like plasma with reduced density and flow velocity in a relatively thin (less than about 1 earth radius) layer bordering the plasma sheet at low latitudes and bordering the lobe environment at high latitudes. Satellite data have demonstrated the presence of PBL over the entire sunward magnetosphere near the magnetopause. A brief summary is presented of recent published results on two distinct regions of the PBL: that bordering open field line regions, and that bordering closed field line regions. Several suggested source mechanisms for the PBL are discussed and compared.

58334 **Solar wind-magnetosphere-ionosphere coupling.** Hones, E.W., Jr. (California, University, Los Alamos, NM). pp 83-100 of Solar-terrestrial influences on weather and climate. Dordrecth, Netherlands; D. Reidel Publishing Co. (1979).

From Solar-terrestrial influences on weather and climate symposium; Columbus, OH, USA (24-28 Aug 1978).

The paper describes the influence of the sun's particulate emissions upon the earth's magnetosphere and its ionosphere. It is concerned only with the solar wind interaction. The discussion covers the following: plasma, momentum, and energy transfer from the solar wind to the magnetosphere the magnetotail: storage and release of energy and interaction of the outer magnetosphere with the ionosphere. Recent evidence suggests that the field-aligned currents from the interaction region create field-aligned fields at altitudes of 1 to 2 earth radii, and that these are responsible for the acceleration of particles that produce auroral arcs.

58335 **(AD-A—110309/2) Optical pumping studies of collisional interactions. Final scientific report.** Franz, F.A. (Indiana Univ., Bloomington (USA). Dept. of Physics). 23 Nov 1981. 27p. NTIS, PC A03/MF A01.

A final scientific report is given on a project involving application of optical pumping techniques to studies of atomic collisions. Magnetic depolarization, nuclear spin efforts, collisional selection rules, surface interactions, and studies of sudden and quasi molecular collisions between alkali atoms and noble gas atoms are particularly emphasized.

58336 **(AD-A—110689/7) Calculation of electron-hydrogen, deuterium and oxygen molecules. Final report, April 1979-April 1980.** Poe, R.T.; Choi, B.H. (California Univ., Riverside (USA). Dept. of Physics). Jun 1981. 74p. NTIS, PC A04/MF A01.

Calculations are made on the vibrational transition cross sections of e-H2, D2 scatterings in the energy range of 0 appox. 10eV. Both hybrid theory and the simultaneous vibrational and rotational adiabatic-nuclei approximation are employed in the calculation. It turns out that the latter approximation scheme yields better results than the hybrid theory approach when compared with experimental measurements on 0 yields v vibrational excitation. The resonance peaks of the elastic scattering and vibrational excitation cross section obtained from the vibrational and rotational adiabatic-nuclei approximation are quite broad between 2 approx. 3 eV, which are in good agreements with experimental data. This seems to indicate that the periods of the vibrational and rotational motions are comparable to each other and longer than the lifetime of the compound molecule. In general, the rate of the vibrational transition decreases as the quantum number change increases. The e-02 vibrational transition cross sections have also been explored with a semi-quantitative analysis.

Portions of document are illegible.

An aerosol is the transitional condition of matter between the equilibrium gas and condensed states. This paper reviews recent advances in the description of the compositional dependences of free molecular and transition regime aerosol collision rates that are essential to the understanding of the evolution of this nonequilibrium condition of matter. To set the physical context, selected current advances in homogeneous nucleation theory are described. These results, which are based upon metastable equilibrium prior to the onset of nucleation, are related to the nonequilibrium collisions of post-critical nuclei or aerosols. Since all particles interact via attractive potentials whose mathematical forms become singular at contact, a new procedure is described which has been developed for computing the free molecular collision rates of spherical particles that both exploits this singularity and is readily generalizable to transition regime collisions. The physics of the molecular van der Waals interaction and its mathematical form for interacting point dipoles with arbitrary retardation are reviewed. Difficulties in the straightforward generalization of the molecular theory to condensed media interactions are pointed out and used to motivate the Lifshitz theory of the van der Waals interactions of condensed media. A model for the spectral retardation of the sphere-sphere interaction potential is introduced and used in computations of those energies for 1 to 100 nm radii spheres of several materials. These energies are used in the computation of collision rate enhancements over the hard-sphere collision rates, the properties of these enhancements including the effects of retardation are discussed, and they are compared with experiment where possible. Potential applications of these methods in aerosol flocculation and filtration are discussed.

58340 (CEA-CONF—6000) **Diffraction of high energy electrons.** Bourret, A. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Dept. de Recherche Fondamentale). Oct 1981. 17p. (In French). (CONF-8109141—2). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702255.

From Summer school of electron microscopy in material sciences; Bombannes, France (21 Sep 1981).

The diffraction of electrons by a crystal is examined to study its structure. As the electron-substance interaction is strong, it must be treated in a dynamic manner. Using the N waves theory and physical optics the base equations giving the wave at the outlet are deduced for a perfect crystal and their equivalence is shown. The more complex case of an imperfect crystal is then envisaged in these two approaches. In both cases, only the diffraction of high energy electrons (> 50 KeV) are considered since in the diffraction of slow electrons back scattering cannot be ignored. Taking into account an increasingly greater number of beams, through fast calculations computer techniques, enables images to be simulated in very varied conditions. The general use of the Fast Fourier Transform has given a clear cut practical advantage to the multi-layer method.

58341 (CONF-810728—6) **Convoy electron production in heavy-ion-solid collisions.** Sellin, I.A.; Breinig, M.; Brandt, W.; Laubert, R. (Oak Ridge National Lab., TN (USA); New York Univ., NY (USA); East Carolina Univ., Greenville, NC (USA)). 1981. Contract W-7405-ENG-26. 29p. NTIS, PC A02/MF A01. Order Number DE82018174.

From 9. international conference on atomic collisions in solids; Lyon, France (6 Jul 1981).

The properties of the sharp v vector/sub e/ ≅ v vector cusps observed in the velocity spectrum of convoy electrons (v vector/sub e/) ejected in heavy ion-solid collisions in the ion velocity range (v vector) 6 to 18 au are compared to the properties of analogous cusps observed in binary electron capture to the continuum (ECC) and electron loss to the continuum (ELC) collisions in gases. Apart from a skew toward v vector/sub e/ > v vector, the v-independent convoy distributions observed are very similar to those for ELC and the cusp widths are the same in both cases. While the shape of convoy peaks is approximately independent of projectile Z, v, and of target material, yields in polycrystalline targets (C, Al, Ag, Au) exhibit a strong dependence on Z and v. Coincidence experiments in which convoy electrons are allocated according to emergent ion charge-state q/sub e/ show a surprising independence of q/sub e/, mirroring the unweighted statistical emergent charge-state fraction. Coincidence experiments of O^{6+} $^{7+}$ $^{8+}$ ions traversing < 110 > and < 100 > channels in Au show a strong yield suppression and a dependence of yield on the channel chosen. Interpretation of these observations, comparisons to convoy production studies using protons, and a discussion of remaining puzzles is given. The history of ECC, ELC, and wake-riding models of convoy electron production is also reviewed.

58342 (DOE/ER/40001—33) **Research and development on optically pumped polarized ion sources. Technical progress report, February 1, 1982-January 31, 1983.** Anderson, L.W. (Wisconsin Univ., Madison (USA)). Jul 1982. Contract AC02-81ER40001. 50p. NTIS, PC A03/MF A01. Order Number DE82019288.

Portions of document are illegible.

Progress on the development of optically pumped polarized Li^- and Na^- ion sources is reported. Also, the development of polarized $^3He^-$ and H^- ion sources using optically pumped Na vapor targets is described. (WHK)

58343 (EFI—461(3)-81) **K-ionization by channeling relativistic particles.** Darbinyan, S.M.; Ispiryan, K.A. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 28p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702256.

The energy and orientation dependences of the cross-section of atomic K-shell ionization by relativistic particles in crystals are investigated theoretically. It is shoum that the K-shell ionization cross-section in germanium crystal in the case of channelling increases approximately 1.25 and 1.6 times for the axial and planar channelling of negative particles and decreases approximately 0.6 times for planar channelling of positive particles, respectively, as compared with the case of absence of channelling.

58348 (IPPJ-AM—16) **Two-centre Coulomb phaseshifts and radial functions.** Nakamura, H.; Takagi, H. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Dec 1980. 85p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE82701968.

Two-centre radial Coulomb functions and phaseshifts are calculated numerically, and are tabulated. Only the homonuclear case is considered.

58349 (JINR—R-4-81-515) **Convergence of adiabatic expansion in the three-body problem with the Coulomb interaction.** Vinitskij, S.I.; Melezhik, V.S.; Ponomarev, L.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 14p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702243.

A method is proposed for calculating the contributions of higher states of the discrete and continuous spectra of the two-center problem into the binding energy of a three-body system, by which the energy levels of mesic molecules may be found with an accuracy of 10^{-3} eV. The convergence of the expansion of wave functions of mesic molecules of hydrogen isotopes over the adiabatic basis is investigated numerically.

58350 (JINR—R-14-81-534) **Temperature breaking of hydrogen bonds in ammonia as studied by πp meson capture in hydrogen.** Bannikov, A.V.; Vasil'ev, V.A.; Kachalkin, A.K.; Levai, B.; Petrukhin, V.I.; Strakovskij, I.I.; Khorvat, D.; Yutlandov, I.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems; AN SSSR, Leningrad. Inst. Yadernoj Fiziki). 1981. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702251.

The capture probability of stopped π^--mesons by hydrogen atoms of ammonia increases with temperature in liquid phase while in supercritical phase it is temperature independent. This effect can be attributed to the temperature breaking of hydrogen bonds. Rough estimations are given for the fraction of broken hydrogen bonds at various temperatures.

58351 (JINR-R—4-81-255) **Nuclear widths and level shifts of a dtμ mesic molecule.** Bogdanova, L.N.; Markushin, V.E.; Melezhik, V.S. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702318.

Nuclear widths GITAsup(Jv) and shifts ΔEsup(Jv) of dtμ mesic molecule levels (Jv) due to dt s-wave resonant interaction are expressed through the $d+t \rightarrow n+{}^4He$ reaction cross section. It is established that the nuclear resonance ${}^5He^*(3^+/2)$ weakly influences the spectrum of mesic molecule because of the small probability of dt being inside the range of nuclear forces in the dtμ-molecule and the big inelastic width of the resonance. The nuclear widths and shifts calculated agree well with the results obtained with the generalized optical potential corresponding to the two coupled channels (dt-n^{4}He) problem.

58352 (JUEL—1697) **Measurement of spin polarization of electrons in their photoemission from nickel and cobalt single crystals with photon energies in the area of photothreshold.** Kuhlmann, E. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Festkoerperforschung). Dec 1980. 96p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE82903601.

Thesis. Submitted to Koeln University, Germany.

We have measured with s-polarized light near threshold and the spin-polarization P of photoelectrons from Ni(001), -(110) and -(111) and from Co(0001)- and -(10 anti 10) surfaces. The cylindrically shaped samples were magnetized perpendicular to the surface (longitudinal magnetization) up to complete saturation by an external magnetic field. With these experimental conditions a differential energy-analysis as well as angle- analysis of the emitted electrons is not feasible. However, for photon energies in the range 1 to 2 eV above threshold the energy distribution of the collected electrons is narrow and, because of energy conservation, emission occurs primarily normal to the surface (cone$<15^0$). The effect of the external magnetic field on the electron trajectories and their spin direction has been determined by computational methods.

58353 (KFKI—1980-61) **Excitations with complex wavenumbers in a Hubbard chain. I. States with one pair of complex wavenumbers.** Woynarovich, F. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). 1980. 44p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82902894.

Portions of document are illegible.

Those excited states of a half filled 1-d Hubbard chain are studied which are connected with electron pairs occupying the same sites. It is argued, that these states are to be described by such solutions of the Lieb-Wu equations in which some of the wavenumbers are complex. Solutions of this type, corresponding to S/sup z/ = 1/2N-1 and singlet states, are found. The energy-momentum dispersion is also calculated. The gap in the spectrum of the singlet excitations is found to be equal to the discontinuity of the chemical potential calculated by Lieb and Wu.

58354 (KFTI—78-46, pp 47-49) **Emission of relativistic channelling electrons.** Vit'ko, V.I.; Grishaev, I.A.; Shramenko, B.I. 1978. (In Russian). NTIS (US Sales Only), PC A05/MF A01.

In Technique of physical experiment.

The solution of the Dirac equation for electrons in the field of a continuous atomic chain is considered. Wave functions of bound states and energy levels of electrons are found. The expression for the radiation spectrum and total intensity is obtained.

58355 (ORNL—5909) **Enhanced ion backscattering near 180⁰ scattering angles in the two-atom scattering model.** Oen, O.S. (Oak Ridge National Lab., TN (USA)). Aug 1982. Contract W-7405-ENG-26. 41p. NTIS, PC A03/MF A01. Order Number DE82020475.

An analytical two-atom scattering model has been developed to treat the recent discovery of the enhancement near 180⁰ of Rutherford backscattering yields from disordered solids. In contrast to conventional calculations of Rutherford backscattering that treat scattering from a single atom only (the backscattering atom), the present model includes the interaction of a second atom lying between the target surface and the backscattering atom. The projectile ion makes a glancing collision with this second atom both before and after it is backscattered. A weighted average is made over all possible positions of this second atom. The model predicts an enhancement effect whose physical origin arises from the tolerance of path for those ions whose ingoing and outgoing trajectories lie in the vicinity of the critical impact parameter. Results using Moliere scattering show how the yield enhancement depends on ion energy, backscattering depth, exit angle, scattering potential, atomic numbers of the projectile and target, and target density. In the model the critical impact parameter and critical angle play important roles. It is shown that these quantities depend on a single dimensionless parameter and formulas accurate to better than 1% are given for them.

58356 **System-bath decomposition of the reaction path Hamiltonian for polyatomic scattering: Quantum perturbative treatment.** Miller, W.H.; Schwartz, S. (Department of Chemistry and Materials and Molecular Research Division of the Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* 77: No. 5, 2378-2382(1 Sep 1982).

An approach to quantum mechanical reactive scattering in polyatomic molecular systems is described. The formulation is based on the reaction path Hamiltonian of Miller, Handy, and Adams [J. Chem. Phys. 72, 99 (1980)]. The essential physical idea is that the reaction coordinate in even polyatomic systems may be coupled strongly to only a few (one or two) of the vibrational modes orthogonal to it, and rather weakly coupled to the (perhaps many) remaining modes. This leads naturally to a "system-bath" decomposition of the reaction process, and this paper shows how this is carried through for the reaction path Hamiltonian. If only one transverse mode is included with the reaction coordinate to form the "system," for example, then the overall model is that of a collinearlike reaction, whose dynamics are treated accurately, taking place in a (harmonic) "bath" to which it is weakly coupled.

58357 **Low temperature free energy relations for electron transfer reactions.** Webman, I.; Kestner, N.R. (Chemistry Department , Louisiana State University, Baton Rouge, Louisiana 70803). *Journal of Chemical Physics;* 77: No. 5, 2387-2398(1 Sep 1982).

Using the multiphonon theory of electron transfer reactions we present calculations and simple expressions for the rate of electron transfer between molecules in a medium as a function of the free energy changes, especially in the exothermic region. We include effects of the medium modes as well as higher frequency modes which are allowed to change during the reaction. We find that there are activated as well as nonactivated regions depending on the free energy change and the temperature. The rate in the so called "anomalous" (or nonactivated) region decreases much more slowly with free energy than it does in the activated region. In fact, the logorithm of the rate depends roughly linearly on the free energy change in that region. Fortunately the rate is most dependent on the frequency of the high energy modes and less on the coupling strength about which we know the least. In addition we have studied uses of frequency averaging to reproduce the results of a multimode case.

58358 Test of the linear sum rule for vibrational energy transfer by trajectory calculations. Truhlar, D.G.; Blais, N.C. (Department of Chemistry, University of Minnesota, Minneapolis, Minnesota 55455). *Journal of Chemical Physics;* 77: No. 5, 2430-2431(1 Sep 1982).

Vibrational relaxation rate constants for H_2 in a bath of Ar are computed for v = 0, 4, 6, 10, and 13 and a rotational-translational temperature of 4500 K. The relaxation rate increases by a factor of 5.5 as v is raised from 0 to 10, then decreases by 33% as v is raised to 13. The v dependence of the vibrational relaxation violates a linear sum rule that is required to hold for an information theoretic synthesis of state-specific rate constants from bulk relaxation data.

58359 Study of the formation of high molecular weight water cluster ions (m/e<59 000) in expansion of ionized gas mixtures. Beuhler, R.J.; Friedman, L. (Chemistry Department, Brookhaven National Laboratory, Upton, New York 11973). *Journal of Chemical Physics;* 77: No. 5, 2549-2557(1 Sep 1982).

Mass spectrometric determinations have been made of size distributions of cluster ions produced by expansion of ionized mixtures of water and various carrier gases. Measurements span a range up to mass to charge ratios of 59 000. Dilute water—nitrogen carrier gas mixtures producing cluster masses up to 12 000 gave size distributions which are first order in water concentration. This observation is explained by the relatively large value of the ion—dipole associative collision cross sections which determined the rate of growth of cluster ions in the mass range studied. Studies in different mass carrier gases show that cluster ion size distributions are largely determined by the cross section for, and number of, associative collisions taking place during the expansion process. Estimates of associative collision efficiency have been made for water and alcohol cluster ion growth on expansion. Evidence has been obtained for steric inhibition of efficient alcohol collision processes compared to relatively efficient water clustering.

58360 Dynamic corrections for neutron scattering of water in the free molecule approximation. Blum, L.; Rovere, M.; Narten, A.H. (Department of Physics, Faculty of Natural Sciences, University of Puerto Rico, Rio Piedras, Puerto Rico 00931). *Journal of Chemical Physics;* 77: No. 5, 2647-2655(1 Sep 1982).

We develop a quantum mechanical theory for the inelasticity or Placzek correction for an asymmetric top rigid rotator, and give a formula to compute this correction for neutron scattering. We have, however, used a sphericalized model which satisfies Mecke's sum rule to compute the correction for H_2O and D_2O. Since this rigid rotor model fails to satisfy the exact first sum rule, we introduce a form that does satisfy this condition. Good agreement with the large momentum exchange (k) behavior in the case of D_2O is obtained. However, for the H_2O this is not so and adjustable parameters have to be introduced to obtain the correction asymptotic behavior.

58361 C(KVV) Auger line shape of chemisorbed CO. Koel, B.E.; White, J.M.; Loubriel, G.M. (Department of Chemistry, University of Texas, Austin, Texas 78712). *Journal of Chemical Physics;* 77: No. 5, 2665-2669(1 Sep 1982).

Using x-ray excitation, the C(KVV) Auger spectrum for CO chemisorbed on Ni(100) has been measured and deconvoluted to provide the undistored line shape. This line shape is compared with spectra for gas phase CO and $Fe(CO)_5(g)$. The magnitude of U/sub eff/, a final state interaction term, is shown to be near zero for chemisorbed CO, indicating that significantly different relaxation/screening processes occur in this case as compared to gas phase CO and metal carbonyls. Charge—transfer screening of the core hole in the Auger initial state is proposed to account for the small value of U/sub eff/.

58362 Observation of a steric effect in the reaction of Xe* with photodissociation polarized IBr. de Vries, M.S.; Srdanov, V.I.; Hanrahan, C.P.; Martin, R.M. (Department of Chemistry, University of California, Santa Barbara, California 93106). *Journal of Chemical Physics;* 77: No. 5, 2688-2689(1 Sep 1982).

This communication reports the first use of photodissociation polarization to study reaction cross sections as a function of molecular orientation. A beam of metastable Xe* atoms was crossed with a beam of rotationally oriented IBr molecules. Excimer formation was studied as a function of IBr orientation, by observation of the excimer emission intensity. The reaction cross section was found to be largest when the Xe* approaches parallel to the plane of rotation of the IBr, and smallest when the Xe* approaches perpendicular to the plane of rotation.

58363 Vibrational anharmonicity constants for UF_6: The ν_3 transitions at 16 μm. Krohn, B.J.; Kim, K.C. (Los Alamos National Laboratory, University of California, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* 77: No. 4, 1645-1648(15 Aug 1982).

Assignment of nine hot-band Q branches in the ν_3 (16 μm) region of the diode laser spectrum of UF_6, and measurement of their wave number displacements from the origin of the fundamental band, provide values of effective anharmonicity constants x_{34}, x_{35}, and x_{36}. The relationship x/sub 3j/ = -aω°/sub j/, where a = (1.28 +- 0.08) x 10^{-3} and ω°/sub j/ = normal-mode wave number for j = 4, 5, or 6, has been used to compute spectra in good qualitative agreement with observed spectra between T = 170 K and room temperature.

58364 Time-independent quantum mechanical theory for multiphoton dissociation of diatomic molecules. Whaley, K.B.; Light, J.C. (The James Franck Institute and The Department of Chemistry, The University of Chicago, Chicago, Illinois 60637). *Journal of Chemical Physics;* 77: No. 4, 1818-1825(15 Aug 1982).

A nonperturbative expression for the rate of dissociation from the ground vibrational state of a diatomic molecule in the presence of an infrared laser field is derived using R-matrix techniques. No rotating wave approximation and no metastable levels are introduced. The result is applied to a model system and to HF to obtain the dependence of multiphoton dissociation rate upon laser frequency and intensity. Dissociation is predicted at fields of order 10^{13} W/cm².

58365 Multiphoton photofragmentation of SO_2 at 248 nm. Wilson, M.W.; Rothschild, M.; Muller, D.F.; Rhodes, C.K. (Department of Physics, University of Illinois at Chicago Circle, Chicago, Illinois 60680). *Journal of Chemical Physics;* 77: No. 4, 1837-1841(15 Aug 1982).

Sequential two-photon photoexcitation of SO_2 at 248 nm is found to lead to a number of primary fragments including $S(^3P)$ and $SO(X\ ^3\Sigma^-)$. Further excitation of some of these photoproducts was also observed, occurring by both linear and two-quantum mechanisms. The resulting molecular X←B (v",2) ultraviolet fluorescence from SO and the atomic $^3P \leftarrow {}^3S$ vacuum ultraviolet emission from S atoms were detected and an analysis of the energy flow patterns was made.

58366 Effects of collision energy and ion vibrational excitation on proton and charge transfer in H_2i $+N_2$, CO, O_2. Anderson, S.L.; Turner, T.; Mahan, B.H.; Lee, Y.T. (Materials and Molecular Research Division, Lawrence Berkeley Laboratory and Department of Chemistry, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* 77: No. 4, 1842-1854(15 Aug 1982).

The effects of vibrational excitation of reagent ions and collision energy on the proton and charge transfer reactions of H_2^+ and D_2^+ with N_2, CO, and O_2 have been investigated using a method combining photoionization and a radio frequency guided ion technique. For proton transfer the $H_2^+ + N_2$ results are quite similar to the $H_2^+ + Ar$ system; proton and charge transfer channels are closely coupled for kinetic energies above 3 eV. In contrast, for $H_2^+ + CO$, the vibrational dependence of proton transfer is quite weak. For the $H_2^+ + O_2$ case, evidence is seen for direct competition between the charge and proton transfer process. A simple model for charge transfer is used to assess the importance of energy resonance and Franck—Condon effects. In these simple molecular systems, the energy defect is found to be most important to charge exchange, although Franck—Condon factors play a substantial role.

58367 Rare gas—halogen atom interaction potentials from crossed molecular beams experiments: I(^{2}P/sub 3/2/)+Kr, Xe($^1S_0$). Casavecchia, P.; He, G.; Sparks, R.K.; Lee, Y.T. (Materials and Molecular Research Division, Lawrence Berkeley Laboratory and Department of Chemistry, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* 77: No. 4, 1878-1885(15 Aug 1982).

Angular distributions of I(^{2}P/sub 3/2/) scattered off Kr and Xe($^1S_0$) in the thermal energy range have been measured in crossed molecular beams experiments. The interaction potentials for two relevant states (X 1/2 and I 3/2) for each of the systems are obtained by using an approximate elastic scattering analysis, which neglects nonadiabatic coupling, as previously done for other rare gas—halogen systems. The I—Xe (X 1/2) potential (epsilon-c = 0.69 kcal/mol, r/sub m/ = 4.30 A) and, to some extent, I—Kr (X 1/2) potential (epsilon-c = 0.55 kcal/mol, r/sub m/ = 4.05 A) shows a slightly more attractive interaction than the interaction potentials of Xe—Xe and Xe—Kr, but the I—Xe (I 3/2) potential (epsilon-c = 0.48 kcal/mol, r/sub m/ = 4.60 A) and the I—Kr (I 3/2) potential (epsilon-c = 0.36 kcal/mol, r/sub m/ = 4.32 A) present shallower epsilon-c's, a larger r/sub m/, and stronger repulsive walls than the corresponding rare gas pair potentials. The results obtained from this and previous investigations are reviewed.

58368 Measurement of atomic densities using radiation trapping. Garver, W.P.; Pierce, M.R.; Leventhal, J.J. (Department of Physics, University of Missouri-St. Louis, St. Louis, Missouri 63121). *Journal of Chemical Physics;* 77: No. 3, 1201-1205(1 Aug 1982).

The apparent lifetimes of the ^{2}P/sub 1/2/ and ^{2}P/sub 3/2/ states of Na have been measured as functions of n, the atomic density, and the results compared to theory. It is shown that these measurements made under equilibrium, steady-state conditions may be used to determine n under nonequilibrium, nonsteady-state conditions. This technique of measuring n has advantages over the surface ionization technique, especially for values of n greater than about 10^{10} cm^{-3}. Extension of the technique to other atoms and molecules is discussed.

58369 Trimer formation, atom exchange, and dissociation in argon dimer collisions. Thompson, D.L. (Department of Chemistry, Oklahoma State University, Stillwater, Oklahoma 74078). *Journal of Chemical Physics;* 77: No. 3, 1269-1273(1 Aug 1982).

Cross sections and rate coefficients are presented for the reactions that occur in argon dimer—dimer collisions. Quasiclassical trajectories are used to compute cross sections as a function of the initial relative translational energy and rate coefficients as a function of translational temperature and initial argon dimer internal excitation for trimer formation and the dissociation reactions.

58370 Influence of vibrational and translational energies on energy transfer in Ar+HCl (J = 0, 2, 6, and 12). Thompson, D.L. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* 77: No. 3, 1286-1294(1 Aug 1982).

The influence of initial relative translational energy on pure-rotational energy transfer in various vibrational states of HCl in collisions with Ar has been studied by using quasiclassical trajectory calculations and a model potential-energy surface. The vibrational states v = 0, 3, and 6 and initial rotational states J/sub i/ = 0, 2, 6, and 12 were studied over the collision energy range 0.1 to 1.0 eV. The results show that pure-rotational energy transfer is not, in general, a strong function of the vibrational state in which the energy transfer takes place. It is found that there is a difference in the dependence of the cross section on the initial relative translational energy for low J/sub i/ and high J/sub i/.

58371 Classical and quantum mechanical studies of HF in an intense laser field. Dardi, P.S.; Gray, S.K. (Department of Chemistry and Materials and Molecular Research Division of the Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* 77: No. 3, 1345-1353(1 Aug 1982).

The behavior of an HF molecule in an intense laser field is investigated with both classical trajectories and quantum dynamics. Vibration-rotation transition probabilities and energy absorption as a function of laser pulse time are calculated for the diatomic initially in its ground state. For comparison, results are also reported for a model nonrotating HF molecule. It is found that classical mechanics does not predict the correct time behavior of the system, nor does it predict the correct rotational state distributions. Classical mechanics does, however, predict pulse time averaged quantities to be the correct order of magnitude. There is also a correct general trend of increased multiphoton excitation for laser frequencies red-shifted from the one-photon resonance, although multiphoton resonance peaks are not observed in the classical results and far too little multiphoton excitation is predicted. The effect of laser phase has also been investigated and shown to be relatively unimportant in both the classical and quantum dynamics.

58372 Electronic energy transfer in near-resonant electron capture collisions of H^+Z with metal atoms: Radiative and nonradiative transitions. Gellene, G.I.; Cleary, D.A.; Porter, R.F.; Burkhardt, C.E.; Leventhal, J.J. (Department of Chemistry, Cornell University, Ithaca, New York 14853). *Journal of Chemical Physics;* 77: No. 3, 1354-1361(1 Aug 1982).

Modes of energy disposal in electron capture of $H^+{}_2$ with metal atoms (Cs, K, Mg, and Zn) for ion velocities in the range 3—7 x 10^7 cm/s are examined using combined optical and beam scattering techniques. Radiative and nonradiative transitions are observed for processes occurring under near resonant conditions. The following branching sequences are identified: Branching ratios are dependent on the vibrational state and the nuclear separation (Franck—Condon factors) of the $H^+{}_2$ ion at the time of electron capture. The branching ratio decreases for the (triplet)/(singlet) formation for H_2 produced from reactions of vibrationally relaxed $H^+{}_2$ ion with K or Cs. Under conditions of $H^+{}_2$ ion relaxation, the kinetic energy of scattered atomic hydrogen following radiative decay from $^3\Sigma^+$/sub g/ state of H_2 increases, implying a shift in the $^3\Sigma^+$/sub g/→$^3\Sigma^+$/sub u/ continuum toward longer wavelengths. The results also show that, at these velocities, the reations occur under near-resonant conditions with vertical transitions.

58373 Mechanisms for electronic energy transfer between molecules and metal surfaces: A comparison of silver and nickel. Whitmore, P.M.; Robota, H.J.; Harris, C.B. (Department of Chemistry and Materials and Molecular Research, Division of Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* 77: No. 3, 1560-1568(1 Aug 1982).

The phosphorescence lifetime of pyrazine above a Ag (111) surface has been measured as a function of molecule—metal separation between 10 and 420 A. The distance dependence of lifetime is in accord with the predictions of the classical point dipole theory over this range of distances. Using this classical model, the decay of electronically excited pyrazine is separated into contributions from radiative decay, resonant surface plasmon excitation, and lossy surface wave damping. The relative importance of these decay channels is calculated for silver and nickel in the near UV, and the dominant mechanism for energy transfer to these two metals in this distance regime is interpreted in terms of the electronic structure of the metal.

58374 Fabrication of extractor grids for neutral beam sources. Brouchous, D.A.; Conrad, J.R. (Department of Nuclear Engineering, University of Wisconsin, Madison, Wisconsin 53706). *Review of Scientific Instruments;* **53**: No. 8, 1182-1184(Aug 1982).

The fabrication of tungsten wires for use in extractor grids on neutral beam ion sources is described. The tungsten wires are machined from 0.152-cm-diam tungsten wires into triangular wires by a three-step grinding process. These grid wires have been used in the neutral beam sources for Phaedrus (6 keV beams) and for the Wisconsin Levitated Octupole (15 keV beams). The beam angular divergence is comparable to that obtained from commercially supplied grid wires.

58375 Simple sample cell for deoxygenation of surfactant solutions. Buell, S.L.; Demas, J.N. (Department of Chemistry, University of Virginia, Charlottesville, Virginia 22901). *Review of Scientific Instruments;* **53**: No. 8, 1298-1299(Aug 1982).

A simple gas bubbling system for removal of dissolved oxygen in micellar and surfactant solutions is described. The cell design allows for a continuous rapid flow of a purge gas through a surfactant solution without loss of fluid in spite of severe foaming. A long-necked cell with a conical top causes the bubbles to rupture without overflowing, and the fluid returns to the bulk solution. The cell offers numerous advantages over freeze pump thaw and other methods of deoxygenation in terms of speed, ease of sample preparation, and cost.

58376 Generation of a cold, intense relativistic electron beam using a magnetized foilless diode. Sheffield, R.L.; Montgomery, M.D.; Parker, J.V.; Riepe, K.B.; Singer, S. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Applied Physics;* **53**: No. 8, 5408-5413(Aug 1982). Contract W-7405-ENG-36.

An annular electron beam with less than 30 mrad of angular velocity spread, a radius of 1 cm, and a current density exceeding 0.4 MA/cm^2 has been generated with a magnetized foilless diode. The diode current loss is limited to less than a few percent by careful design of the tapered transition region connecting a self-magnetically insulated vacuum transmission line to the externally magnetized foilless diode. Details of the transition section design and operating characteristics of the electron beam generator are given.

58377 Operating characteristics of a magnetically insulated reflex ion diode. Strobel, G.L. (Lawrence Livermore National Laboratory, University of California, P. O. Box 808, Livermore, California 94550). *Journal of Applied Physics;* **53**: No. 8, 5414-5419(Aug 1982).

Steady-state space charge limited-flow calculations have been carried out for an applied B/sub theta/ magnetically insulated reflexing ion diode. Reflex ion energy spectra characteristic of a thin foil cathode and of a transparent mesh have been used. A one-dimensional calculation shows higher ion current densities with a mesh cathode, and that the emission electron current density increases with the applied B/sub theta/ magnetic field. The ion current density is calculated to increase slightly with radius.

58378 Absolute experimental cross sections for the electron impact single, double, triple, and quadruple ionization of Cs^+ ions. Hertling, D.R.; Feeney, R.K.; Hughes, D.W.; Sayle II, W.E. (School of Electrical Engineering, Georgia Institute of Technology, Atlanta, Georgia 30332). *Journal of Applied Physics;* **53**: No. 8, 5427-5434(Aug 1982).

Absolute cross sections for the single, double, triple, and quadruple ionization of Cs^+ ions by electron impact have been measured from below their respective thresholds to approximately 5000 eV. These measurements have been made using a crossed beam facility operated in a pulsed beam mode. Numerous consistency checks were performed in order to identify and evaluate possible sources of experimental error.

58379 Vibrational and rotational energy distribution of NO scattered from the Pt(111) surface: Detection by two-photon ionization. Asscher, M.; Guthrie, W.L.; Lin, T.; Somorjai, G.A. (Materials and Molecular Research Division, Lawrence Berkeley Laboratory, Department of Chemistry, University of California, Berkeley, California 94720). *Physical Review Letters;* **49**: No. 1, 76-79(5 Jul 1982). Contract AC03-76SF00098.

The vibration and rotational state distributions of a supersonic nitric oxide beam, scattered from a Pt(111) single crystal surface, were investigated. A two-photon ionization technique was applied to monitor the internal energy content of the scattered molecules. Vibrational distributions were found to be colder than that corresponding to the crystal temperature between 450—1100 K. Rotational temperatures were also found to be colder than expected for thermal equilibrium with the platinum surface.

58380 Generation of continuously tunable narrow-band radiation from 1220 to 1174 A in Hg vapor. Tomkins, F.S.; Mahon, R. (Chemistry Division, Argonne National Laboratory, Argonne, Illinois 60439). *Optics Letters;* **7**: No. 7, 304-306(Jul 1982).

Continuously tunable, narrow-band radiation is generated in Hg vapor from the 11p $^1P_1$ transition at 1220 A, through the series limit at 1187.9 A, and on out to 1174 A. This range includes the resonance transitions of neutral atomic hydrogen, deuterium, nitrogen, and xenon, some absorption profiles of which are presented.

58381 Atomic emission spectroscopy with a skimmed inductively coupled Ar plasma. Montaser, A.; Fassel, V.A. (Ames Laboratory and Department of Chemistry, Iowa State University Ames, Iowa 50011). *Applied Spectroscopy;* **36**: No. 4, 454-459(Jul 1982). Contract W-7405-ENG-82.

A skimmer located below the usual observation height of an inductivity coupled plasma (ICP) allows the axial channel region of the ICP to flow through the central hole of the skimmer while the outer Ar flow is deflected. Signal-to-background (S/B) ratio and the estimated detection limits measured immediately above the skimmer were generally 5 to 20 times superior to the best results obtained by the conventional ICP system. The highest S/B lines possessed wavelengths greater than 300 nm. Matrix effect studies on the $Ca\text{-}PO_4$ and the Ca-Al systems revealed that the skimmed plasma was as free of vaporization-atomization interference as the conventional plasma, but easily ionizable elements produced a greater level of suppression/enhancement effects. Electron number densities, as determined via the series limit line merging technique, were lower in the skimmer plasmas as compared with the conventional ICP's.

58382 Corrections to the muonium hyperfine splitting of relative order α2(m/sub e//m/sub μ/). Bodwin, G.T.; Yennie, D.R.; Gregorio, M.A. (Department of Physics, University of Illinois at Champaign-Urbana, Urbana, Illinois 61801). *Physical Review Letters;* **48**: No. 26, 1799-1802(28 Jun 1982).

This paper presents the results of an analytic calculation of the corrections of relative order α^2(m/sub e//m/sub μ/) to the muonium ground-state hyperfine splitting due to exchanged photons. Theory and experiment are compared, with these corrections and some radiative-recoil contributions described in an accompanying paper taken into account.

58383 Kinematic analysis of photoelectrons from polarized targets with J = 1/2. Huang, K. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review Letters;* **48**: No. 26, 1811-1814(28 Jun 1982). Contract W-31-109-ENG-38.

A complete kinematic analysis of photoelectrons from polarized targets with total angular momentum J = 1/2 is given for the first time. Several simple experiments are suggested to test correlation and relativistic effects in atoms or molecules.

58384 Variational Monte Carlo Calculations for spin-aligned deuterium. Panoff, R.M.; Clark, J.W.; Lee, M.A.; Schmidt, K.E.; Kalos, M.H.; Chester, G.V. (McDonnell Center for the Space Sciences and Department of Physics, Washington University, St. Louis, Missouri 63130). *Physical Review Letters;* **48**: No. 24, 1675-1677(14 Jun 1982). Contract AC02-79ER10353;AC02-76ER03077.

The first variational Monte Carlo calculations of the ground-state energy of spin-aligned deuterium Darrow-down are presented. By using the Slater-Jastrow trial wave functions, the calculations are based on the accurate theoretical pair potential of Kolos and Wolniewicz for the $b^3\Sigma^+$/sub u/ state. For Darrow-down with equal population of the three nuclear-spin states, the minimum theoretical ground-state energy is found to be negative, implying that this system is a liquid at zero temperature under zero external pressure.

58385 Time-dependent Hartree-Fock theory of charge exchange: Application to He^{2+}/He. Kulander, K.C.; Devi, K.R.S.; Koonin, S.E. (Theoretical Atomic and Molecular Physics Group, Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review* [*Section*] *A: General Physics;* **25**: No. 6, 2968-2975(Jun 1982).

An application of the time-dependent Hartree-Fock (TDHF) theory of charge transfer in atomic collisions is presented. Probabilities for elastic and double symmetric charge exchange are calculated for a fixed laboratory scattering angle and for collision energies from 10 to 70 keV. The TDHF equations are solved using finite difference techniques and propagated in time using the Peaceman-Rachford alternating-direction implicit method. Plots of time-evolved charge densities are presented also.

58386 Observation of two-electron photoionization of the H^- ion near threshold. Donahue, J.B.; Gram, P.A.M.; Hynes, M.V.; Hamm, R.W.; Frost, C.A.; Bryant, H.C.; Butterfield, K.B.; Clark, D.A.; Smith, W.W. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review Letters;* **48**: No. 22, 1538-1541(31 May 1982). Contract AS04-77ER03998.

Photoejection of both electrons from the H^- ion by a single incident photon has been observed with use of a crossed relativistic beam technique. The dipole selection rules for a single-photon pick out the $^1P^0$ final state. The relative cross section was measured over a 0.30 eV range of photon energies near threshold in steps of 0.007 eV with a resolution of 0.007 eV full width at half maximum. The energy dependence of the cross section in this region was consistent with a Wannier threshold law.

58387 Application of ab-initio optical potentials to low-energy electron-H_2 scattering. Schneider, B.I.; Collins, L.A. (Los Alamos National Lab., NM (USA)). *Journal of Physics B: Atomic and Molecular Physics;* **15**: No. 9, L335-L340(14 May 1982).

The linear algebraic technique is extended from the static-exchange level to treat correlation and polarisation effects in electron-molecule collisions by means of an optical potential. The technique is applied to e-H_2 scattering.

58388 Close-coupling calculation of Li^+-H_2 diffusion cross sections. Dickinson, A.S.; Lee, M.S. (Newcastle upon Tyne Univ. (UK). Dept. of Atomic Physics); Lester, W.A. Jr. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). *Journal of Physics B: Atomic and Molecular Physics;* **15**: No. 9, 1371-1376(14 May 1982).

The diffusion cross sections Qsub(d)(j→j^1) have been calculated for the 0→0, 0→2 and 2→2 transitions in Li^+-H_2 collisions at total energies between 46.4 and 51 meV. For the elastic cross sections the results were within 15% of those obtained classically using the spherical component of the H_2 polarisability. The value of Qsub(d)(0→2) is much larger than that obtained previously by Alexander (J. Chem. Phys.; 64:4498 (1976)) but is too small to be significant for the room-temperature mobility.

58389 Electron energy recovery system for negative ion sources. Dagenhart, W.K.; Stirling, W.L. (to Department Of Energy). US Patent 4,329,586. 11 May 1982. Filed date 17 Sep 1980. vp.

PAT-APPL-187915.

An electron energy recovery system for negative ion sources is provided. The system, employs crossed electric and magnetic fields to separate the electrons from ions as they are extracted from a negative ion source plasma generator and before the ions are accelerated to their full kinetic energy. With the electric and magnetic fields oriented 90° to each other, the electrons are separated from the plasma and remain at approximately the electrical potential of the generator in which they were generated. The electrons migrate from the ion beam path in a precessing motion out of the ion accelerating field region into an electron recovery region provided by a specially designed electron collector electrode. The electron collector electrode is uniformly spaced from a surface of the ion generator which is transverse to the direction of migration of the electrons and the two surfaces are contoured in a matching relationship which departs from a planar configuration to provide an electric field component in the recovery region which is parallel to the magnetic field thereby forcing the electrons to be directed into and collected by the electron collector electrode. The collector electrode is maintained at a potential slightly positive with respect to the ion generator so that the electrons are collected at a small fraction of the full accelerating supply voltage energy.

58390 Photoelectron angular distributions: energy dependence for s subshells. Manson, S.T.; Starace, A.F. (Department of Physics, Georgia State University, Atlanta, Georgia 30303). *Reviews of Modern Physics;* **54**: No. 2, 389-405(Apr 1982). Contract AC02-76ER02892.

An overview of the theory of photoelectron angular distributions for atoms is presented. Its features, which are embodied in a single asymmetry parameter β in the electric dipole approximation, are examined within the framework of the angular momentum transfer formulation. The β parameter is in principle always energy dependent. Within the LS coupling approximation, however, there are instances, each representing a multitude of particular photoionization processes, in which β is an analytically determined constant. The energy dependence of the β parameters in such instances is due entirely to spin-orbit and other relativistic interactions. It is shown that the asymmetry parameters for atomic s subshells are particularly suitable for distinguishing between purely geometrical effects on the photoelectron angular distribution, resulting from physical conservation laws, and dynamical effects arising from relativistic interactions and electron exchange and correlation. In general, the β parameters for s subshells vary with energy; such variation is largest near minima in the cross sections for the corresponding photoelectron channels and in the vicinity of resonances. However, a number of atomic photoionization transitions are identified for which β would be a constant (equal to one of the three values 2, 1/5, or -1) were it not for relativistic interactions and (in some cases) final-state interchannel coupling and/or initial-state electron correlations. Measurement or calculation of the β parameters for such transitions thus provides a sensitive measure of the strength of relativistic interactions as well as of electron correlations.

58391 Reversibility effects in disordered and ordered solids leading to scattered-ion yield enhancements near 180°. Appleton, B.R.; Holland, O.W.; Barrett, J.H. (Oak Ridge National Lab., TN (USA). Solid State Div.). *Nuclear Instruments and Methods in Physics Research;* **191**: No. 1-3, 507-515(31 Dec 1981).

From 5. international conference on ion beam analysis; Sydney, Australia (16 - 20 Feb 1981).

A general review is given of the recently discovered phenomenon of enhanced ion backscattering near 180°. Examples of experimental results are presented that illustrate the nature of the enhancement and its basic dependences on angle and depth. It is shown that the various aspects of the effect can be reproduced by computer simulations that include the effects of trajectory reversibility, nuclear recoils and detector depth resolution. Measured and calculated results are given that illustrate the dependences of the enhancement on ion and target parameters. Results are presented of the enhancement observed in amorphous Ge and in single crystal of Ge rotated to create a reference spectrum. The enhancement is greater for the rotating crystal case demonstrating crystalline effects on the enhancement. Also presented are some results for the enhancement of the surface yield in a channeling direction of a crystal in the 180° geometry; possible application for surface studies is discussed.

58392 **Vibrational and rotational energy transfer in Ar + HF.** Thompson, D.L. (Los Alamos National Lab., NM). *Chemical Physics Letters;* **84**: No. 2, 397-400(1 Dec 1981).

State-to-state energy transfer cross sections for Ar + HF (v = 2, 4, and 6; J = 4, 6, 8, and 10) were computed using quasiclassical trajectories. Rotational energy transfer is invariant with increasing v, but vibrational energy transfer is significantly enhanced by increasing J.

58393 **Asymptotic, Pade approximant method for legendre series.** Baker, G.A. Jr.; Gubernatis, J.E. pp 232-242 of Orthogonal polynomials, continued fractions and Pade approximation. Los Alamos, NM; Los Alamos Scientific Laboratory (1980).

We introduce a generalized, Pade approximant. The distinctive feature of the method is its incorporation of a known asymptotic behavior of the series coefficients as a function of their order. For several examples drawn from potential scattering theory, this method of acceleration of convergence is compared with two others and is found to be the most efficient, but not dramatically so.

58394 **Nonlinear optical processes in atoms and molecules using rare-gas halide lasers.** Bischel, W.K. (SRI International, Menlo Park, CA); Bokor, J.; Kligler, D.J.; Rhodes, C.K. *IEEE (Institute of Electrical and Electronics Engineers) Journal of Quantum Electronics;* **QE-15**: No. 5, 380-392(May 1979). Contract AM03-76SF00115.

The use of nonlinear optical processes expands the flexibility of excimer systems in the study of a wide range of atomic and molecular phenomena and materials. These mechanisms have already allowed for the selective excitation of states in the 10 to 20 eV range involving bound state excitation, ionization, and molecular dissociation. Specific examples involving the electronic excitation of H_2, Kr, and Xe, the production of Xe^+ for the analysis of the molecular properties of XeF^*, and nonlinear photodissociation of N_2O and OCS are discussed. 61 references, 11 figures.

58395 **Properties of continuum source particle beams. I. Calculation methods and results.** Dahneke, B.E.; Cheng, Y.S. (Univ. of Rochester, NY). *Journal of Aerosol Science;* **10**: 257-274(1979).

The properties of continuum source particle beams, also called aerosol beams or seeded molecular beams, are investigated. Beams generated by expansions through converging cone nozzles are considered. Beam properties pertinent to the application of aerosol beams in the on-line measurement of particle size and composition distributions are emphasized. Methods for calculating the dependence of aerosol beam properties on particle size, shape and mass, source temperature and pressure and nozzle geometry are described and results are presented. The calculated results are compared to experimental data. A simple empirical method of modeling frictionless, isentropic transonic and supersonic flow in a free jet is described and used in the numerical experiments.

58396 **Behavior of decaying states in applied fields.** Low, F.E. (Massachusetts Inst. of Tech., Cambridge). *Physica A (Amsterdam);* **96**: 260-262(1979).

The behavior of decaying atomic states in applied fields is studied. Corrections to expected line shapes of order α^3Z^2 are found and calculated for the hydrogen n = 2 system.

58397 **(AD-A—110929/7) MHD phenomena at high magnetic Reynolds number. Final report.** Gill, S.P.; Mukherjee, D. (Artec Associates, Inc., Hayward, CA (USA)). Dec 1981. 104p. (FR—137). NTIS, PC A06/MF A01.

Exact MHD solutions have been derived for the propagation of a shock-ionized plasma through applied magnetic field configurations pertinent to two- and three-dimensional MHD generators and plasma diagnostics. Calculated magnetic field perturbations and Faraday voltages are presented for a wide range of magnetic Reynolds number. The solutions provide insight into eddy current and magnetic diffusion effects in MHD generator sections.

58398 **(AD-A—111012/1) Finite element analysis of magnetoelastic plate problems. Technical report February 1979-August 1981.** Yuan, K.Y. (Cornell Univ., Ithaca, NY (USA). Dept. of Structural Engineering). Aug 1981. 247p. NTIS, PC A11/MF A01.

Magnetic forces acting on conducting metal structures are significant in the design of such devices as fusion reactors, magnetohydrodynamic generators, magnetically levitated vehicles, magnetic forming devices, and various electric machines. The magnetic loads on these structures may be pulsed or cyclical and arise from the interaction between the induced eddy currents in the conductor and the externally applied magnetic fields. Moreover, the velocity and finite deformation of the conducting structure may interact with the electromagnetic fields to yield a coupled problem. This thesis presents an integrated study of magnetoelasticity problems for thin nonferrous conducting plates. Three phases of the study have been emphasized: theoretical modelling of interaction problems, finite element eddy current calculations for rigid conducting plates, and finite element numerical studies of coupled magnetoelastic problems. Experimental results by others and analytical solutions for limiting cases have been used to verify the numerical results obtained at each stage of the investigation. The Fortran programs developed for each part of the study are also described. The electrodynamics and continuum mechanics bases of the problem are presented in the modelling part of the study.

58399 **(CEA-CONF—5888) Volume misfit around an isotopic impurity in solid helium.** Landesman, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique du Solide et de Resonance Magnetique). Aug 1981. 3p. (CONF-810809—27). NTIS (US Sales Only), PC A02/MF A01.

From 16. international conference on low temperature physics; Los Angeles, CA, USA (19 Aug 1981).

The dilation associated to substitutional impurities in solid helium is related to their influence on the thermal conductivity and to their motion as studied by NMR. The agreement between the results of various experiments and theoretical models is shown to remain unperfect.

58400 **(CEA-CONF—5986) Numerical simulation of the non-linear turbulent dynamo effect.** Meneguzzi, M.; Frisch, U.; Leorat, J.; Pouquet, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service d'Electronique Physique). Sep 1981. 2p. (In French). (CONF-8109140—1(Summ.)). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702253.

From 5. French symposium on mechanics; Marseille, France (7 Sep 1981).

58401 **(DOE/ER/10028—T1) Pseudo-spectral calculations of shock waves, rarefaction waves, and contact surfaces. Final report.** Taylor, T.D.; Myers, R.B.; Albert, J.H. (Aerospace Corp., El Segundo, CA (USA)). 1 Oct 1980. Contract AC01-79ER10028. 11p. NTIS, PC A02/MF A01. Order Number DE82015139.

The selection-rule filtering techniques were applied to one-dimensional flows. The tests have shown that problems with spectral expansion behavior near steep gradients can be overcome.

58402 **(HU-TFT—81-14) Quasiclassical theory of ions in ^{3}HE.** Thuneberg, E.V.; Kurkijaervi, J.; Rainer, D. (Helsinki Univ. (Finland). Research Inst. for Theoretical Physics). 1981. 26p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702700.

The quasiclassical equations for the quasiparticle propagator in superfluid ^{3}He are formulated in the presence of a strong localized potential and solved for an ion in the B-phase. The loss in condensation energy occasioned by the ion is calculated and evaluated numerically for a hard sphere scattering model of the ion. The effects of more general quasiparticle scattering properties are discussed.

58403 **(KFKI—1980-114) Cluster perturbation theory for classical fluids. I.** Kollar, J. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). 1980. 25p. B, MF A01. Order Number DE82902731.

Portions of document are illegible.

A perturbational method in the form of a power series in a softness prameter Ξ has been developed for determining the thermodynamic properties and the pair correlation function of a real fluid using the thermodynamic quantities and distribution functions of a reference system. The method makes possible a simple treatment for the higher order terms and enables us to take into account some parts of the higher order terms in the usual density-dependent form of the thermodynamic quantities, in terms of lower order terms, namely those parts, that can be expressed in terms of the dervatives of lower order distribution functions with respect to the density. Thus we expect to achieve higher accuracy compared to the usual treatments in the case, when we know, for example, only the pair correlation function of the reference system, since the method makes full use of the information content of the pair function. Besides, new conditions have been proposed for the optimal choice of the reference system.

58404 **Theory of the shock process in dense fluids.** Wallace, D.C. (Los Alamos Scientific Laboratory, Los Alamos, New Mexico 87545). *Physical Review [Section] A: General Physics;* **25**: No. 6, 3290-3301(Jun 1982).

A shock is assumed to be a steady plane wave, and irreversible thermodynamics is assumed valid. The fluid is characterized by heat conduction and by viscous or viscoelastic response, according to the strain rate. It is shown that setting the viscosity zero produces a solution which constitutes a lower bound through the shock process for the shear stress, and upper bounds for the temperature, entropy, pressure, and heat current. It is shown that there exists an upper bound to the dynamic stresses which can be achieved during shock compression, that this bound corresponds to a purely elastic response of the fluid, and that solution for the shock process along this bound constitutes lower bounds for the temperature and entropy. It is shown that a continuous steady shock is possible only if the heat current is positive and the temperature is an increasing function of compression almost everywhere. In his theory of shocks in gases, Rayleigh showed that there is a maximum shock strength for which a continuous steady solution can exist with heat conduction but without viscosity. Two more limits are shown to exist for dense fluids, based on the fluid response in the leading edge of the shock: for shocks at the overdriven threshold and above, no solution is possible without heat transport; for shocks near the viscous fluid limit and above, viscous fluid theory is not valid, and the fluid response in the leading edge of the shock is approximately that of a nonplastic solid. The viscous fluid limit is estimated to be 13 kbar for water and 690 kbar for mercury.

58405 **Third sound in layered superfluids: Harrow-down on ^{4}He.** Guyer, R.A.; Miller, M.D. (Laboratory for Low Temperature Physics, Department of Physics and Astronomy, University of Massachusetts, Amherst, Massachusetts 01003). *Physical Review [Section] B: Condensed Matter;* **25**: No. 9, 5749-5755(1 May 1982).

In order to minimize the possibility of spin flips due to interactions with and on the walls of a sample cell, spin-polarized hydrogen (Harrow-down) is studied in a ^{4}He sample cell, i.e., a sample cell which has been coated with a film of superfluid ^{4}He. At low temperatures it is expected that the most dense Harrow-down sample will first form in the physisorbed state on the ^{4}He film. In this paper we examine in detail the hydrodynamic consequences of this lyered film configuration. We derive the expression for third sound in the general case that the films are compressible and both films have undergone superfluid transitions. In this case two propagating modes will be seen which will provide an unequivocal demonstration of a superfluid transtion in the Harrow-down film. We specialized to various limiting cases: incompressible films, saturated and unsaturated films, and the normal fluid Harrow-down blanket. In our discussion we stress the point that even if the Harrow-down has not gone superfluid it will still shift the ^{4}He third-sound speed, that this shift is a direct measure of the Harrow-down film areal density, and that the magnitude of this shift is expected to be well within the precision of present-day third-sound eperimental techniques. Thus third sound is expected to be a primary diagnostic tool in the study of Harrow-down films.

58406 **Elliptic-vortex method for incompressible flow at high Reynolds number.** Teng, Z. (Department of Mathematics, Peking University, Peking, China). *Journal of Computational Physics;* **46**: No. 1, 54-68(Apr 1982). Contract W-7405-ENG-48.

An elliptic-vortex model for approximating the time-dependent Navier-Stokes equations at high Reynolds number is presented. One attractive feature of the new method is that the elliptic-computational elements used in this model are very good for boundary layer flow. Also introduced are a modified boundary algorithm and a new outflow boundary condition. Numerical computations for flat-plate problems show that the new method converges very fast and the numerical results are in excellent agreement with known facts.

58407 **Solution of the time-dependent inertial-frame equation of radiative transfer in moving media to O(v/c).** Mihalas, D.; Klein, R.I. (Sacramento Peak Observatory, Sunspot, New Mexico 88349). *Journal of Computational Physics;* **46**: No. 1, 97-137(Apr 1982). Contract W-7405-ENG-48.

A stable and efficient mixed-frame method has been formulated for the solution of the time-dependent equation of radiative transfer with full retention of all velocity dependent terms to O(v/c). The method retains the simplicity of the differential operator found in the inertial frame while transforming the absorption and emission coefficients to the comoving frame keeping them isotropic. The method is ideally suited to continuum calculations. To correctly treat the time dependence of the radiation field over fluid-flow time increments, the velocity-dependent terms on the right-hand side of both the transfer and moment equations must be retained for consistency.

58408 **Statistical mechanics via the method of complementary variational principles. I. Application to classical, two-dimensional fluids.** MacCarthy, J.E.; Kozak, J.J. (Univ. of Notre Dame, IN). *Molecular Physics;* **44**: No. 3, 761-781(1981).

A new, versatile, theoretically self-consistent procedure is proposed for determining the thermodynamic properties of a classical system in the condensed fluid phase. The method of complementary variational principles, developed by A.M. Arthurs and his colleagues, is used to generate reference state (hard core) correlation function data via analysis of a well known (non-linear) integral equation for the pair distribution function (namely, the Yvon-Born-Green equation). These data are then used within the context of the perturbation theory of classical fluids developed by Zwanzig, as implemented by Barker and Henderson, to investigate the role of attractive and repulsive perturbations in influencing the thermodynamics of the reference system. As a specific application of this procedure, one that leads to many new results, we focus on a classical system of particles whose effective interactions are confined to a space of two dimensions. We consider two classes of potential functions (the square well/square shoulder and linear well/linear shoulder potentials) and consider separately the effects of attractive and repulsive perturbations.

58409 **Quasi-three-dimensional modeling of flow in MHD channels.** Ahluwalia, R.K.; Doss, E.D. (Argonne National Lab., IL). *Numerical Heat Transfer;* **3**: 67-87(Jan 1980).

A set of two-dimensional turbulent boundary-layer equations that describe the three-dimensional fluid flow in a magnetohydrodynamic channel is outlined. The equations are solved by an implicit finite-difference scheme a method of calculating the pressure gradient is used that avoids the need to iterate over the coefficients of the difference equations. The numerical method is tested by applying it to low and high-speed flows over a flat plate. It is shown that the governing equations fully satisfy the three-dimensional conservation laws. The importance of accounting for three-dimensional effects is assessed, and an advanced technique for bringing out better the interaction between the boundary layers on sidewalls and electrode walls is discussed.

58410 **Sphere drag at Mach numbers from 0.3 to 2.0 at Reynolds numbers approaching 10^7.** Miller, D.G. (Univ. of California, Livermore); Bailey, A.B. *Journal of Fluid Mechanics;* **93**: 449-464(1979). Contract W-7405-ENG-48.

The analysis of 18th and 19th century cannon firings shows that knowledge of sphere drag can be substantially extended into the region of 0.3 ≦ M/sub infinity/ ≦ 2.0 and Re/sub infinity d/ up to 10^7. Bashforth's chronographic measurements (1868) are of a quality comparable to modern measurements. The data of Mayevski (chronograph, 1868), Hutton (ballistic pendulum 1787 to 1791), and Didion (ballistic pendulum, 1839 to 1840) are of lesser accuracy but in agreement with Bashforth's. These cannon data are combined with modern data to provide the most extensive curves available of C/sub D/ vs Re/sub infinity d/ in this region. Interesting features of these curves for M/sub infinity/ ≦ 1.0 are briefly described.

58411 **Simulation of three-dimensional MHD duct flow.** Ahluwalia, R.K.; Doss, E.D. (Argonne National Laboratory, Argonne, Ill.). pp 195-228 of National Conference on Numerical Methods in Heat Transfer, 1st, University of Maryland, College Park, Md., September 24-26, 1979, Proceedings. Shih, T.M. College Park, MD; University of Maryland (1979).

From National conference on numerical methods in heat transfer; College Park, MD, USA (24 Sep 1979).

A set of two-dimensional turbulent boundary layer equations that describes the three-dimensional fluid flow in a magnetohydrodynamic channel is outlined. The equations are solved by an implicit finite difference scheme. A method of calculating the pressure gradient is used that avoids the need to iterate over the coefficients of the difference equations. The numerical method is tested by applying it to slow- and high-speed flows over a flat plate. It is shown that the governing equations fully satisfy the three-dimensional conservation laws. The importance of accounting for three-dimensional effects is assessed, and an advanced technique for bringing out better the interaction between the boundary layers on sidewalls and electrode walls is discussed.

58412 **(CERN—81-18) Progress report on CERN activities (June 1981).** Schopper, H. (European Organization for Nuclear Research, Geneva (Switzerland)). 7 Dec 1981. 40p. (In French). NTIS (US Sales Only), PC A03/MF A01; Translated from the English original CERN--81-17. Order Number DE82702011.

A selection of subjects illustrates the results obtained at CERN, especially during the first half-year of 1981. The report deals mainly with the development of installations for the storage and the acceleration of antiprotons and for the realization of collisions between beams of antiprotons and protons. The other developments of accelerators and particle detectors are equally mentioned. Thereafter the general aspect of our actual knowledge of the constituents of matter and the forces acting between them is analyzed. This framework is used for the presentation of the experimental results obtained at CERN. The evoked questions include the tests of the quark-parton model, the properties of the new particles containing charmed or beauty quarks, the studies of the structure of the nucleon, the tests of quantum chromodynamics (QCD), and the research on the weak interaction.

58413 **(CERN—81-19) Bruno Touschek legacy. Vienna 1921-Innsbruck 1978.** Amaldi, E. (European Organization for Nuclear Research, Geneva (Switzerland)). 23 Dec 1981. 88p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE82702012.

A biographical portrait of Bruno Touschek, an Austrian physicist who, before and during the Second World War, went through the dramatic adventures of a non-pure arian young person. Later he worked in Germany, Great Britain and Italy. Touschek was the first to propose chiral symmetry. He was the initiator and main driving force in the early developments of $e^+ e^-$ colliding machines. His wide scientific culture, his ingenuity and enthusiams for any new challenging problem and the search of its solution were essential elements in determining the extraordinary influence Bruno had on the work of his younger colleagues. 'He led an intense and vigorous life and by his example and friendliness helped many colleagues and friends to achieve greater happiness and awareness in their own lives'.

A topical conference on the Application of Microprocessors to High-Energy-Physics Experiments was held at CERN, May 4-6, 1981. These proceedings contain the unedited manuscripts of invited talks, contributed papers and posters received from the authors.

6451 Particle Interactions And Properties - Experimental

REFER ALSO TO CITATION(S) 57847, 57968, 58511, 58606, 58606, 58629

58416 **(EFI—467(9)-81) Spectra of cumulative protons in the γ12 C (yields) PX process at γ -quanta maximum energy 4.5 GeV.** Alanakian, K.V.; Amarian, M.J.; Demirchian, R.A.; Egiyan, K.Sh.; Karumian, J.V.; Kocharova, Zh.L.; Ogandjanian, M.S.; Sharabian, Yu.G. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 23p. NTIS (US Sales Only), PC A02/MF A01.

Experimental energy and angular distributions of inclusive photoprotons produced on ^{12}C by bremsstrahlung γ-quanta with maximum energy 4.5 GeV, at proton detection angle 20-120 deg and momenta 0.4-1.3 GeV/c are presented. It is shown that in the case of cumulative production the energy distributions of photoprotons are described well by the exponential, whereas for non-cumulative protons the spectrum is flattened out in the high-energy region. The experimental data obtained are analysed from the viewpoint of three theoretical models trying to explain the cumulative production of particles on nuclei.

58417 **(FRNC-TH—1061) Production of events with two or three muons in the final state during the interaction on nucleons of neutrinos and anti-neutrinos of the CERN narrow band beam with a maximum energy of 200 GeV.** Maillard, J. (Paris-6 Univ., 75 (France)). Mar 1979. 255p. (In French). NTIS (US Sales Only), PC A12/MF A01.

Thesis.

A study was made of the production of dimuons and trimuons in the neutrino interactions using the data of the CDHS (CERN-Dortmund-Heidelberg-Saclay Cooperation) experiment taken in the CERN narrow band beam. The analysis of the quick results (since the statistics are weak) leads to significant conclusions on these events: 1) the c quark fragmentation function is approximately flat, 2) the production of heavy leptons, if this exists, only represents a very small part of the charged currents (10^{-4} approximately). 3) the pair production of charmed quarks can explain some of the dimuons of same sign, the greater part of these events coming from the semi leptonic disintegration of pions and kaons ($\pi \rightarrow \mu\nu, K \rightarrow \mu\nu$) produced in the hadronic jet. 4) any other process (for instance the production of b quarks) is very weak ($< 10^{-3}$ of the charged currents).

58418 **(HU-P—192) Inclusive Σip (1385) production in anti pp interactions at 12 GeV/c.** Karimaeki, V.; Kinnunen, R.; Korkea-aho, M. (Helsinki Univ. (Finland). Dept. of High Energy Physics). Jan 1981. 30p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702710.

Inclusive production of Σ^{+-}(1385) resonances is studied in antipp interactions at 12 GeV/c. The cross sections for Σ^{+}(1385)+cc and Σ^{-}(1385)+cc are determined to be 251 +- 38 μb and 123 +- 30 μb, respectively. The inclusive spectra are presented as a function of Feynman x, c.m. rapidity and the squared transverse momentum psub(T)sup(2). Significant differences with the corresponding pp data are found in the longitudinal momentum distributions. The qualitative features of the production can be explained by simple quark ideas.

58419 **(IFVE-OEIPK—81-72) Comparison of strange antibaryon and strange meson production in K^{+} p interactions at 32 GeV/c.** Chliapnikov, P.V.; Gerdyukov, L.N.; Khromova, G.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 17p. NTIS (US Sales Only), PC A02/MF A01.

New experimental results are presented on inclusive production properties of anti Σsup(*+)(1385) and anti Σsup(*-) (1385) in K^{+} p interactions at 32 GeV/c. The analysis is based on significantly larger statistics than previously available. A comparison is made of invariant x-distributions of K^{0}/ anti K^{0}, anti Λ and anti Ξ^{+} and of anti Σsup(*+-) (1385) and Ksup(*+) (892). These spectra exhibit regularities expected from the quark-recombination picture when it is assumed that the strange mesons and antibaryons are produced off the strange anti s- valence quark in the incident K^{+} meson. Transverse momentum distributions are also presented for Ksup(*+) (892) and anti Σsup(*+-) (1385) and found to be very similar. The results on strange antibaryon average multiplicities disagree strongly with a recent version of the additive quark model.

58420 **(IFVE-OEIPK—81-111) Study of inclusive production of πip mesons and protons in pp interactions at 32 GeV/c.** Vlasov, E.V.; Babintsev, V.V.; Bumazhnov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 53p. (In Russian). (SERP-E—122). NTIS (US Sales Only), PC A04/MF A01.

Results are presented on the inclusive production of π^{+-} mesons and protons in anti pp interactions at an incident antiproton momentum of 32 GeV/c in Mirabelle, based on a sample of 55,000 of inelastic events. The spectra of π^{+} (π^{-}) and p are separated in the whole kinematically admitted region of phase space by a statistical method. The semi-inclusive and inclusive cross sections and the main average characteristics of the π^{+} and p production are calculated. The invariant differential cross sections are studied as functions of the Feynman scaling variable x, the rapidity and the transverse momentum psub(T). The analysis of the form of the invariant x- distributions of π^{+-} mesons in the proton fragmentation region shows no significant contributions from the processes with quark exchange or annihilation. For psub(T)sup(2)>1 (GeV/c)sup(2) there is an evidence of the effects from the hard quark scattering on mesons or baryons.

58421 **(IFVE-OEIPK—81-112) Study on longitudinal correlations between pions in fragmentation regions of primary hadrons in K^{-} p interactions at 32 GeV/c.** Bumazhnov, V.A.; Gumenyuk, S.A.; Moiseev, A.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 31p. (In Russian). (SERP-E—77). NTIS (US Sales Only), PC A03/MF A01.

Longitudinal correlations between pions inclusively produced in the target and beam fragmentations are studied in inclusive K^{-} p experiment at 32 GeV/c. The analysis of the differential distributions of chaAged pions, produced in the proton fragmentation region under other charged pion trigger reveals an absence of x_2-scaling. Two- and three pions longitudinal center-of-mass distributions are also studied and their behaviour showed a significant deviation from the simple quark recombination predictions. Significant long-range correlations, found between momenta of π^{-} mesons from the proton fragmentation and of π^{+} mesons from the K^{-} fragmentation, can be an indication of the existence of the quark exchange or quark annihilations in the initial K^{-} p collisions.

58422 **(IFVE-ONF—81-71) Inclusive Ksup(*+)(1430), Ksup(*0)(1430) and f(1270) production in K^{+} p interactions at 32 GeV/c.** Chliapnikov, P.V.; Falaleev, V.P.; Gerdyukov, L.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 31p. NTIS (US Sales Only), PC A03/MF A01.

Results are presented on total and semi-inclusive cross sections structure functions, longitudinal and transverse momentum and particle rapidity distributions of the tensor mesons Ksup(*+)(1430), Ksup(*0)(1430) and f(1270) observed in K^{+}p interactions at 32 GeV/c. The data are compared with Ksup(*+)(892), Ksup(*0)(896) and rho^{0} vector meson production in the same experiment. In agreement with quark-recombination ideas the shapes of inclusive invariant x-spectra for the strange vector and tensor mesons are found to be rather similar, after removal of diffractive and quasi- two-body channels.

58423 **(IFVE-ONF—81-94) Quark jets from antineutrino interactions. 2. Inclusive particle spectra and multiplicities in the quark jets.** Ammosov, V.V.; Denisov, A.G.; Gapienko, G.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 23p. NTIS (US Sales Only), PC A02/MF A01.

The results on inclusive particle production in the antineutrino charged current induced hadron jets observed in the Fermilab 15- ft. bubble chamber are presented. Fractional energy distributions, particle ratios and average multiplicities of the hadrons in the jets are measured. Ratios between the inclusive production rates of different mesons in the jets are studied to seek evidence for the d-quark origin of the observed hadrons. Good over-all agreement with the hypothesis of d-quark fragmentation with universal fragmentation functions obeying isospin systematics is established.

58424 **(ITEF—88(1981)) Properties and interactions of neutrino (1977-1980) beam dump experiments.** Tsukerman, I.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1981. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

Data on search of instantaneous muon and electron neutrinos in experiments of beam dump type are presented in the review. Neutrino is formed in decays of particles rusulted from pN interactions. First experiments of the dump beam type have been realized at the CERN/SPS accelerator in 1975 and Serpukhov accelerator by the ITEF-IFVE group in 1977 with proton energies of 26 and 70 GeV, respectively. The results of beam dump experiments of the second generation in 1979 in CERN are considered in detail. These experiments have been intended for measuring the effect of instantaneous neutrino. The conclusion is drawn on the presence of instantaneous muon neutrinos in the above experiments.

58425 (JINR—R-1-81-429) Sources of leading pions in πip and π^-p interactions at 16 and 40 GeV/c. Bekker, L.; Grishin, V.G.; Kvatadze, R.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1981. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

The source of leading charged pions in π^+p and π^-p interactions at 16 and 40 GeV/c, respectively, is studied. We obtain that approximately 50-60 percent of all leading particles (Xsub(πsub(L))>0.4) with a charge opposite to that of incident pion come from the decay of rho^0, f and g resonances. The probability of double inelastic exchange decreases with increasing Xsub(πsub(L)) and weakly depends on the energy and charge of incident π-meson.

58426 (JINR—R-1-81-437) Inclusive production of πp mesons in np interactions at 3.83 GeV/c. Abdivaliev, A.; Besliu, K.; Gasparyan, A.P.; Gruia, S.; Ierusalimov, A.P.; Cotorbaj, F.; Moroz, V.I.; Nikitin, A.V.; Troyan, Yu.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1981. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

Data on the production of π^- mesons in np interactions at neutron momentum Psub(n)=3.83 GeV/c are presented. The experimental data has been obtained by irradiating the one-meter hydrogen bubble chamber with a monochromatic neutron beam. 13000 of 3- and 5-prong stars were processed. Experimental inclusive characteristics of π^- mesons are studied. Transverse momentum square distribution of π^- mesons, momentum and angular distribution of π^- mesons as well as transverse momentum value dependence of π^- meson on rapidity in the laboratory system are given.

58427 (JINR—R-1-81-496) Some methodical problems of interference investigation of identical pions produced in multiparticle processes at high energy. Angelov, N.; Akhababyan, N.; Grishin, V.G.; Kvatadze, R.A.; Koval'ski, M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1981. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

Some methodical problems emerging at investigation of space- time characteristics of radiation region of secondary pions, produced in hadron-hadron, hadron-nucleus and nucleus-nucleus collisions at high energy are discussed. Simulating the effect of interference in the conditions of real experiment, the limits of the possibility of source region dimensions are determined. In this way, the influence of the normalization of distributions in the evidence of the effect is investigated. In the basis of multicluster model of hadron-hadron interaction, the formation of background distributions by the pions transposition of different events does not deform the parameters of the source region dimensions.

58428 (JINR—R-1-81-542) Comparison of the jet behaviour of hadrons in πsup(-1) interactions at 40 GeV/c with hadron production in e^+e^- annihilation. Grishin, V.G.; Didenko, L.A.; Kanarek, T. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1981. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

Analysis of multiple hadron production in π-p-interactions at 40 GeV/c by means of variables characterizing the jet behaviour of hadrons in the final state "sphericity" (S) and thrust (T) is performed. The results of the analysis of π-p-interactions obtained are compared with analogous data relating to e^+e^- annihilation. For secondary particles distributions of events on sphericity, thrust variables and those characterizing transversal jet dimensions are given. It is concluded that basic characteristics of the hadron jet behaviour in the final state are the same in both types of interactions with the inertia center energy E=10 GeV.

58429 (JINR—R-2-81-487) Scaling of the rapidity distributions in the πpp interactions at Psub(πsup(-))=40 GeV/c. Lyubimov, V.B.; Omboo, Z.; Tuvdendorzh, D.; Uzhinskij, V.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1981. 5p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

The experimental data on the inelastic $\pi^- + p \rightarrow n\pi^+ + X$ and $\pi^- + p \rightarrow n\pi^- + X$ interactions at Psub(πsup(-))=40 GeV/c obtained in the two-meter JINR propane bubble chamber are analyzed. The rapidity distributions of the secondary $\pi^-(\pi^+)$ pions are presented for different partial elasticity coefficients Ksup(+-)=ΣEsub(πsup(+))/√S, where √S - the total c.m.s. energy of a bombarding pion and a target proton, Esub(πsup(+-)) - the c.m.s. energy of $\pi^+(\pi^-)$. The distributions of π^+ and π^- differ at all k. The distributions of π^+ at $k^+ > 0.2$ are reminiscent. In the $\pi^+(\pi^-)$ distributions for the events with ksup(+-)>0.2 there is a plateau the width of which increases with increasing Ksup(+-). The height of the plateau depends significantly on diffraction processes. When the diffraction events are put away the π^+ and π^- characteristics become closer.

58430 (NP—2903591) Scalar mesons and their production in $\gamma\gamma$ scattering. Mennessier, G. (Montpellier-2 Univ., 34 (France)). Jun 1981. 54p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE82903591.

Portions of document are illegible.

Two typical fits are done of the data on the $\pi\pi$ S-waves (I=o), with or without narrow S*, from threshold up to 1.4 GeV. For both, the I=o S and D - wave final state interaction in $\gamma\gamma$ production of $\pi\pi$ and K anti K is calculated in a unitary, analytic formalism. We give the differential cross sections as a function of some parameters related to direct epsilon, S* and f(1270)-$\gamma\gamma$ couplings. In the low energy range, the unitarized Born contribution is in average smaller than the Born one, and the results of the DCI experiment then indicate the need for a direct epsilon $\gamma\gamma$ coupling. Near 1 GeV, there is an effect related to the KK threshold, and more precise data could allow to decide whether a narrow S* exists or not. In the f range, we expect the $\pi^0\pi^0$ peak near 1.29 GeV when $\pi + \pi^-$ peaks at 1.24 GeV.

58431 Measurements of spin parameters in p-p elastic scattering at 6 GeV/c. Linn, S.L.; Perlmutter, A.; Crosbie, E.A.; Ratner, L.G.; Schultz, P.F.; O'Fallon, J.R.; Cameron, P.R.; Crabb, D.G.; Fernow, R.C.; Hansen, P.H.; Krisch, A.D.; Salthouse, A.J.; Sandler, B.; Shima, T.; Terwilliger, K.M. (Department of Physics and Center for Theoretical Studies, The University of Miami, Coral Gables, Florida 33124). *Physical Review* [*Section*] *D: Particles and Fields;* **26**: No. 3, 550-556(1 Aug 1982).

We measured the differential cross section for proton-proton elastic scattering in 6 GeV/c, with both initial spins oriented normal to the scattering plane. The analyzing power A shows significant structure with a large broad peak reaching about 24% near P/sub perpendicular/ ^{2} = 1.6 (GeV/c)^2. The spin-spin correlation parameter A/sub n/n exhibits more dramatic structure, with a small but very sharp peak rising rapidly to about 13% at 90^0/sub tsc.m./. This sharp peak may be caused by particle-identity effects.

58432 Antiproton-proton and proton-proton elastic scattering at 100 and 200 GeV/c. Kaplan, D.H.; Karchin, P.; Orear, J.; Kalbach, R.M.; Krueger, K.W.; Pifer, A.E.; Baker, W.F.; Eartly, D.P.; Klinger, J.S.; Lennox, A.J.; Rubinstein, R.; McHugh, S.F. (Cornell University, Ithaca, New York 14853). *Physical Review* [*Section*] *D: Particles and Fields;* **26**: No. 3, 723-725(1 Aug 1982).

Antiproton-proton elastic scattering has been measured at 100 GeV/c for $0.5<-t<2.5$ (GeV/c)^2 and at 200 GeV/c for $0.9<-t<4$ (GeV/c)^2. The data show that the $-t \cong 1.4$ (GeV/c)^2 dip recently observed at 50 GeV/c persists to higher incident momenta. Proton-proton measurements made at the same beam momenta show similar structure.

58433 Search for exclusive free-quark production in e^+e^- annihilation. Marini, A.; Peruzzi, I.; Piccolo, M.; Ronga, F.; Chew, D.M.; Ely, R.P.; Pun, T.P.; Vuillemin, V.; Fries, R.; Gobbi, B.; Guryn, W.; Miller, D.H.; Ross, M.C.; Besset, D.; Freedman, S.J.; Litke, A.M.; Napolitano, J.; Wang, T.C.; Harris, F.A.; Karliner, I.; Parker, S.; Yount, D.E. (Laboratori Nazionali di Frascati dell'Istituto Nazionale di Fisica Nucleare, I-00044 Frascati, Rome, Italy). *Physical Review Letters;* **48**: No. 24, 1649-1652(14 Jun 1982).

The products of e^+e^- annihilation have been searched at 29-GeV center-of-mass energy for free fractionally charged particles produced in exclusive two-body final states. No evidence for fractionally charged quarks was found and the upper limits on the ratio R/sub q/q-bar = σ/sub q/q-bar/σ/sub mumu-bar/ are below 1% for quarks with charges 1/3 e or 2/3 e and masses below about 14 GeV/c^2. This is the first reported limit for charge 1/3 e. Long-lived fractionally charged leptons are definitely ruled out over a significant range of masses.

58434 **Measurement of the branching fraction for the Cabibbo-suppressed decay tau$^-$→K$^-$ ν/sub tau/.** Blocker, C.A.; Abrams, G.S.; Alam, M.S. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review Letters;* **48**: No. 23, 1586-1589(7 Jun 1982). Contract AC03-76SF00515;W-7405-ENG-48.

The branching fraction for the Cabibbo-supressed decay tau$^-$→K$^-$ ν/sub tau/ is measured from data obtained with the Mark II detector at SPEAR. Fifteen events containing a K^{+-} in coincidence with a muon or electron of opposite charge are observed. It is determined that B(tau$^-$→K$^-$ ν/sub tau/) = (1.3 +- 0.5)%.

58435 **Observation of semileptonic decays of charmed baryons.** Vella, E.; Trilling, G.H.; Abrams, G.S.; Alam, M.S.; Blocker, C.A.; Blondel, A.; Boyarski, A.M.; Breidenbach, M.; Burke, D.L.; Carithers, W.C.; Chinowsky, W.; Coles, M.W.; Cooper, S.; Dieterle, W.E.; Dillon, J.B.; Dorenbosch, J.; Dorfan, J.M.; Eaton, M.W.; Feldman, G.J.; Franklin, M.E.B.; Gidal, G.; Goldhaber, G.; Hanson, G.; Hayes, K.G.; Himel, T.; Hitlin, D.G.; Hollebeek, R.J.; Innes, W.R.; Jaros, J.A.; Jenni, P.; Johnson, A.D.; Kadyk, J.A.; Lankford, A.J.; Larsen, R.R.; Lueth, V.; Millikan, R.E.; Nelson, M.E.; Pang, C.Y.; Patrick, J.F.; Perl, M.L.; Richter, B.; Roussarie, A.; Scharre, D.L.; Schindler, R.H.; Schwitters, R.F.; Siegrist, J.L.; Strait, J.; Taureg, H.; Tonutti, M.; Vidal, R.A.; Videau, I.; Weiss, J.M.; Zaccone, H. (Stanford Lilnear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review Letters;* **48**: No. 22, 1515-1518(31 May 1982). Contract AC03-76SF00515;AC03-76SF00098.

Direct electrons are observed in baryon events produced in e$^+$e$^-$ annihilation at center-of-mass energies above the Λ/sub c/ Lambda-bar/sub c/ threshold. These events are attributed to charmed baryon pair production and subsequent Λ/sub c/ semileptonic decay. Various semileptonic branching ratios of the Λ/sub c/ are determined, including BR(Λ/sub c/→e$^+$X) = (4.5 +- 1.7)%.

58436 **Lifetimes of charmed particles produced in a 20-GeV γp experiment.** Abe, K.; Bacon, T.C.; Ballam, J. (Birmingham University, Birmingham B15 2TT, England). *Physical Review Letters;* **48**: No. 22, 1526-1529(31 May 1982).

Eleven neutral and nine charged decays of charmed particles have been observed in a sample of 205 000 hadronic interactions in a 1.2-million-picture exposure of the SLAC Hybrid Facility bubble chamber to a 20-GeV/c backward-scattered laser beam. The charged and neutral lifetimes were determined to be 8.2/sup +4.5//sub -2.5/ x 10^{-13} and 6.7/sup +3.5//sub -2.0/ x 10^{-13} sec, respectively, with a ratio of 1.2/sup +0.9//sub -0.5/.

58437 **Test of high p/sub T/ scaling from cosmic-ray interactions up to 400 TeV.** Hazen, W.E.; Hendel, A.Z.; Ash, A.G.; Foster, J.M.; Hodson, A.L.; Porter, M.R.; Bull, R.M. (Randall Laboratory of Physics, University of Michigan, Ann Arbor, Michigan 48109). *Physical Review Letters;* **48**: No. 22, 1562-1564(31 May 1982).

The rate of subcores in cosmic-ray air showers has been measured near sea level with a close-packed 35-m^2 array of spark chambers at Leeds. Auxiliary experiments demonstrate that our transition effects are negligible. The rate of subcores versus shower size is translated into the rate of high p/sub T/ events versus energy of the interacting hadron. Comparison with calculations of Halzen favors p/sub T/$^{-4}$ over p/sub T/$^{-8}$ scaling. The highest energy bin is centered on 350 TeV.

58438 **Determination of the fundamental parameters of the K^0-K-bar^0 system in the energy range 30—110 GeV.** Aronson, S.H.; Bock, G.J.; Cheng, H.; Fischbach, E. (Accelerator Department, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review Letters;* **48**: No. 19, 1306-1309(10 May 1982).

K^0 regeneration data in the energy range 30—110 GeV have been analyzed to determine the values of the K/sub L/-K/sub S/ mass difference, Δm, K/sub S/ lifetime, tau/sub S/, and CP nonconservation parameter eta/sub +/-. We find Δm = 0.482(14) x 10^{10}h s^{-1}, tau/sub S/ = 0.905(7) x 10^{-10} s, 'eta/sub +/-' = 2.09(2) x 10^{-3}, and tanphi/sub +/- = 0.709(102), corresponding to phi/sub +/- = 35(4)°. The data suggest that these parameters may have an anomalous energy dependence.

58439 **Amplitude analysis of the reaction πiπ^-→$\pi^0\pi^0$ from 1.0 to 2.3 GeV.** Cason, N.M.; Biswas, N.N.; Baumbaugh, A.E.; Bishop, J.M.; Cannata, P.E.; Dauwe, L.J.; Kenney, V.P.; Ruchti, R.C.; Shephard, W.D.; Watson, J.M. (University of Notre Dame, Notre Dame, Indiana 46556). *Physical Review Letters;* **48**: No. 19, 1316-1319(10 May 1982).

An amplitude analysis of $\pi^+\pi^-$→$\pi^0\pi^0$ scattering from the reaction π^+p→$\Delta^{++}\pi^0\pi^0$ has been carried out between 1.0 and 2.3 GeV. The data are consistent with only one of the four π-π phase-shift solutions determined from $\pi^+\pi^-$→$\pi^+\pi^-$ data. A new J/sup P/C = 2^{++} state at 1800 MeV with a width of 280 MeV is observed.

58440 **Inelastic scattering of high energy muons from nuclear targets.** Miller, M.T. Rochester, NY; Rochester Univ. (1981). 148p. University Microfilms Order No.81-23,992.

Thesis (Ph. D.).

The inelastic cross section of high energy muons from nuclear targets were measured. It was performed using a 10.5 GeV muon beam and a system of multiwire proportional chambers. The energy range was explored and it was found that in most cases muons scatter incoherently from the individual nucleons in the nucleus. However, for a small fraction of the events the nucleons shadow one another resulting in a cross section sigma sub T is approximately sigma sub NA rho where A is the atomic number of the nuclear target. This 'shadowing' effect is attributed to the strongly interacting component of the exchanged virtual photon and its magnitude was found to be in excess of the predictions of current theoretical models.

58441 **Charmonium studies with the Crystal Ball.** Oreglia, M. (Stanford Linear Accelerator Center, CA (USA)). pp 69-82 of Electroweak interactions and unified theories. Proceedings v.2 of the 15. Rencontre de Moriond, les Arcs, 9 - 21 March 1980. Tran Thanh Van, J. (ed.). Dreux, France; Editions Frontieres (1980).

From 15. Rencontre de Moriond; Les Arcs, France (9 Mar 1980).

The Crystal Ball detector at SPEAR is used to analyze the decays psi' → $\gamma\gamma$psi and psi' → γchi,chi → $\gamma\gamma$. Values are obtained for the branching ratio of psi' → eta/π^0psi and psi' → γchi, chi → γpsi. No evidence is found for a 2^1S_0(eta'(c)) state in the mass range 3129 → 3644 MeV/c^2. Analysis of the angular distributions in the cascade chi decays yields spin and multipole assignments for the chi(3.51) and chi(3.55).

58442 **Radiative decays of the psi and psi'.** Aschman, D. (Stanford Linear Accelerator Center, CA (USA); Princeton Univ., NJ (USA)). pp 83-94 of Electroweak interactions and unified theories. Proceedings v.2 of the 15. Rencontre de Moriond, les Arcs, 9 - 21 March 1980. Tran Thanh Van, J. (ed.). Dreux, France; Editions Frontieres (1980).

From 15. Rencontre de Moriond; Les Arcs, France (9 Mar 1980).

The status of the eta(c) signal seen in the Crystal Ball data on psi' and psi radiative decay is presented. The eta(c) has a mass of (2981 +- 15) MeV, and a width of 20 +- 15 MeV. The decay mode eta(c) → eta$\pi\pi$ is observed by fitting to exclusive events. Data on other radiative decays of the psi show evidence for the E(1420) meson.

58443 **psi radiative decays.** Feldman, G.J. (Stanford Linear Accelerator Center, CA (USA)). pp 95-106 of Electroweak interactions and unified theories. Proceedings v.2 of the 15. Rencontre de Moriond, les Arcs, 9 - 21 March 1980. Tran Thanh Van, J. (ed.). Dreux, France; Editions Frontieres (1980).

From 15. Rencontre de Moriond; Les Arcs, France (9 Mar 1980).

Inclusive and exclusive measurements of psi radiative decay are presented. The magnitude of hard inclusive radiative decay is comparable to the prediction of first order QCD, but the measured spectrum is considerably softer. In addition to measurements of radiative decays to the known pseudoscalar and tensor mesons, a sizable decay to a resonance of mass 1440 +10 -15 MeV/c^2 in the KantiKπ mode is observed. This may be the E(1420) meson. Supporting evidence is presented for the existence of the eta(c) at a mass of 2980 MeV/c^2.

58444 **Two-photon interactions from MARK II at SPEAR.** Hollebeek, R. (Stanford Linear Accelerator Center, CA (USA)). pp 107-116 of Electroweak interactions and unified theories. Proceedings v.2 of the 15. Rencontre de Moriond, les Arcs, 9 - 21 March 1980. Tran Thanh Van, J. (ed.). Dreux, France; Editions Frontieres (1980).

From 15. Rencontre de Moriond; Les Arcs, France (9 Mar 1980).

Results on the two-photon production of the eta', f(1270), A_2(1310), and f'(1515) mesons at SPEAR energies are presented using data taken with the Mark II detector. The radiative width of the eta' has been determined to be GAMMA$\gamma\gamma$(eta') = 5.8 +- 1.1 keV (20% systematic uncertainty). Upper limits for the radiative widths of the f, A_2, and f' have been determined.

58445 **Evidence for two body break up at a unique temperature in high energy P-Xe and P-Kr collisions.** Gaidos, J.A.; Gutay, L.J.; Hirsch, A.S.; Mitchell, R.; Ragland, T.V.; Scharenberg, R.P.; Turkot, F.; Willmann, R.B.; Wilson, C.L. pp 339-341 of Hadronic matter at extreme energy density. Cabibbo, N.; Sertorio, L. (eds.). New York, NY; Plenum Publishing Corporation (1980).

This experiment was conducted at FNAL. Using the newly developed warm gas jet facility, hydrogen-noble gas mixtures were injected into the circulating proton beam. During injection, the beam was accelerated between 20 to 400 GeV/c. The target mixtures reported here were 90% H_2 to 10% Xe and 82% H_2 to 18% Kr by partial pressures. Fragments, emerging from the interaction region, were accepted if they satisfied the ΔE . E . VETO trigger. A typical mass spectrum is shown. In attempting to find a mass independent disintegration temperature, we plotted the kinetic energy distributions for each fragment mass emerging from Xenon and Krypton. To our surprise, the inverse logaritmic slope, (temperature) varied between 15 and 20 MeV, about a factor of two larger than the nuclear binding energy.

58446 **(PB—82-157561) Jets and tests of qcd in e+ e- experiments.** Marshall, R. (Science and Engineering Research Council, Chilton (UK). Rutherford Appleton Lab.). [nd]. 36p. (RL—81-087). NTIS, PC A03/MF A01.

This talk presents the current status of QCD tests using PETRA data. The paper is divided into three easy sections. The first section covers essentially qualitative comparisons using Q plots, thrust and P(T) distributions and energy or momentum flow. The second section describes the quantitative determination of (alpha sub s), and the third section covers the scalar-vector tests of QCD. 58447 **(CEA-CONF—6003) Hard exclusive processes in the one - and two - nucleon systems.** Chemtob, M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique). Sep 1981. 17p. (CONF-8109144—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702307.

From 6. international seminar on high energy physics problems: multiquark interactions and quantum chromodynamics; Dubne, USSR (15 Sep 1981).

A description of hard exclusive processes in the one-and two-nucleon system is attempted in the quark parton approach. The discussion deals with the large momentum transfer electromagnetic form factors of nucleon and deuteron as well as the wide angle, high energy nucleon-nucleon scattering differential cross-section and spin correlation parameters. We review the perturbative Quantum Chromodynamics approach initiated in recent works. The limitations of the approach are emphasized to motivate the consideration of a phenomenological approach. The core parton model introduced some time ago is discussed in both its spinless and spin versions. The predictions are compared with measurements.

58448 **(CNRS-CPT—81-P-1308) Parity violation in elastic N-N scattering at high energies.** Chiappetta, P.; Soffer, J.; Wu, T.T. (Centre National de la Recherche Scientifique, 13 - Marseille (France). Centre de Physique Theorique). Sep 1981. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702309.

We calculate the asymmetry in nucleon-nucleon elastic scattering at high energies arising from heavy boson exchange in the standard Weinberg-Salam model. By neglecting the strong interaction enhancement effects, our result for p-n scattering is one order of magnitude higher than for p-p scattering. Enhancement effects increase the p-p asymmetry which may become comparable to the p-n asymmetry. They are however too small if compared with the total cross section asymmetry measured at Argonne at 6 GeV/c on a water target.

58449 **(DOE/ER/40048—13P2) Penetrating flavors.** McLerran, L.; Stodolsky, L. (Washington Univ., Seattle (USA). Dept. of Physics; Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.)). Dec 1981. Contract AC06-81ER40048. 13p. (MPI-PAE/PTH—77/81). NTIS, PC A02/MF A01. Order Number DE82020144.

Hadrons made of heavy flavor quarks are expected to have small cross sections and perhaps reduced energy loss in collisions, leading to their being more penetrating than ordinary hadrons. Some effects of this in cosmic ray phenomena are considered. If the heavy particle lives long enough it can become the dominant hadron component in the atmosphere. With particles of short lifetime there is a threshold effect in energy where the penetrating hadron travels far enough to become important. Some of the anomalous effects in 10^2 to 10^3 TeV phenomena could be caused via this mechanism by a particle with lifetime ~ 10^{-11} sec. An ~ 150 cm thick iron absorber would provide a substantial enhancement in the charm/proton ratio in the 10 to 100 TeV range. If free quarks are produced and have the same cross section as bound quarks, they act as highly penetrating hadrons.

58450 **(EFI—462(4)-81) Exotic baryon resonances with isospins (>=)5/2.** Grigoryan, A.A. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 33p. NTIS (US Sales Only), PC A03/MF A01.

Properties of exotic baryon resonances a(I, S, eta) with isospins I>=5/2, whose existence follows from the dispersion sum rules for the reggeon-particle scattering amplitudes, are investigated. It is shown that the spins S of the states a(I, S, eta) are equal to isospins and intrinsic parities eta are positive. The expressions for the helicity vertex of a(I, S, eta) with Regge trajectories I=1 (rho, A_2, π) are found and the formula for their decay widths is derived. The experiments to search for the states a(I, S, eta) are discussed.

58451 **(EFI—464(6)-81) Inclusive spectra of Δii isobar in hadron-hadron collisions.** Arakelian, G.G.; Grigoryan, A.A. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 22p. NTIS (US Sales Only), PC A02/MF A01.

The comparison of experimental data on Δ^{++}-isobar inclusive spectra in π^{+-}P,PP and anti PP-collisions with the predictions of reggeised π-meson exchange model OPER is carried out. The model describes qualitatively the majority of experimental data. The question of π^0N, $\pi\pi$, Kπ and $\gamma\pi$ total cross section extraction from the data on the inclusive spectra of Δ-isobar is discussed.

58452 **(HU-TFT—81-25) Localization of electrons by electron-electron interaction in an Anderson model.** Ritala, R.K.; Kurkijaervi, J. (Helsinki Univ. (Finland). Research Inst. for Theoretical Physics). 1 Jun 1981. 28p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702714.

We study the effect of attractive Hubbard interaction on disordered electron system. We map the interacting system back to noninteracting one and determine self-consistently the disorder change due to interaction in the system.

58453 **(HU-TFT—81-35) Models for polarization asymmetry in inclusive hadron production.** DeGrand, T.A.; Miettinen, H.I. (Helsinki Univ. (Finland). Research Inst. for Theoretical Physics). 18 Aug 1981. 34p. (UCSB-TH—27-1981). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702703.

The parton recombination model plus SU(6) symmetry is used to relate polarizations in inclusive baryon production to those of the underlying constituent subprocesses. A description of the origin of the polarization asymmetry in terms of Thomas precession of the quarks' spins in the recombination process accounts for all of the qualitative features of the baryon and anti-baryon polarization data.

58454 **(IC—79/5) Confinement, perturbation theory and Sterman-Weinberg jets.** Elias, V.; Rajpoot, S. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702013.

The total charge within the cones of Sterman-Weinberg jets is calculated to first order in perturbation theory in the integer-quark-charge model, a model free of infrared singularities. The same calculation is performed in conventional QCD (with fractionally charged quarks) and is finite in the same sense as the integer-charge calculation; only non-zero masses occur in the logarithms. The finite result implies a liberation of quark quantum numbers, suggesting that confinement cannot be a consequence of the Yang-Mills perturbation theory, but must arise from additional (non-perturbative) mechanisms.

58455 **(IC—79/6) Heavy quark and magnetic moment.** Mubarak, A.; Jallu, M.S. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702015.

The magnetic moments and transition moments of heavy hadrons including the conventional particles are obtained under the SU(5) truth symmetry scheme. To this end state vectors are defined and the quark additivity principle is taken into account.

58456 **(IC—79/7) Dynamical quark mass and the U(1) problem.** Kawarabayashi, K.; Suzuki, T. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702016.

Consistency of Ward identities associated with the U(1) problem is re-analyzed in the WKB approximation. It is argued that when SU(N) x SU(N) is spontaneously broken, a flavour singlet zero-mass boson coupled to the gauge-invariant U(1) current appears in the physical sector, invalidating the usual "solution of the U(1) problem". A possible way to resolve the problem is then discussed.

58457 **(IC—79/8) Flavour and spin structure of linear baryons.** Kawarabayashi, K.; Kitakado, S.; Inami, T. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 30p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702017.

Based on the string picture, a phenomenological model for baryons is constructed and their flavour symmetry, exchange degeneracy pattern and spin structure are studied. Baryons on leading trajectories are assumed to have the configuration of two quarks being attached to the ends of a linear string and the third sitting in the middle, called linear baryons. For such linear baryons, a unitarization scheme can be constructed in a manner similar to the dual unitarity scheme for mesons but without recourse to the 1/N expansion. It is found that the interchange interaction of the middle quark with one of the other two quarks at the ends of the string can give rise to a large exchange degeneracy breaking of baryon spectrum. With this non-planar correction, the model of linear baryons can account for the observed pattern of leading baryon states.

58458 **(IFVE-ONF—81-144) Quasielastic neutrino scattering νsub(μ)+n→μsup(-)+p at 2-20 GeV in bubble chamber SCAT.** Makeev, V.V.; Myagkov, A.G.; Polyarush, A.Yu. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 8p. NTIS (US Sales Only), PC A02/MF A01.

The total cross sections σ and the dN/dq^2 (q^2 - four momentum transfer squared) differential distributions of the νsub(μ)n → μ^-p quasi-elastic scattering have been measured. The experiments were carried out at the SCAT bubble chamber filled with CF_3Br. The σ as a function of neutrino energy and the dN/dq^2 as a function of q^2 are presented. The data were analyzed in terms of the V-A theory of weak interactions. As a result the values of the total hadronic mass Msub(A) were found as 0.90+-0.008 GeV (from the energy dependence) and 0.86+-0.18 GeV (from the dN/dq^2 distribution).

58459 **(IFVE-OTF—80-173) Elastic scattering model of hadrons with large momentum transfers.** Goloviznin, V.V.; Shigirev, A.M.; Solov'ev, L.D.; Shchelkachev, A.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1980. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702521.

The quark parton model (QPM) for deep inelastic lepton-hadron scattering is generalized in order to describe elastic hadron scattering at large momentum transfer. A QPM generalization corresponding to coherent composition of parton subprocess amplitudes is considered. The effects of multiple parton rescattering in the investigated process are assumed negligible. A simple quark-parton model for description of elastic hadron-hadron (hh)-scattering in large momentum transfer ranges is obtained. Ele--ctromagnetic pion and nucleon form factors and differential cross sections for pp-scattering are compared with experiments. The simple mechanism for polarization effects is considered and then the qualitative explanation for sharp growth of the spin-spin correlation parameter Asub(nn) near 90 deg is given.

58460 **(IFVE-OTF—81-28) Possibility of dynamical arising of fermion mass in QCD.** Alekseev, A.I.; Arbuzov, B.A.; Bajkov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 21p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

In the framework of QCD the Schwinger-Dyson equation for fermion propagator is considered in the infrared region. Under assumption of power infrared asymptotics of gluon propagator in two different gauges axial and covariant, the solution of the equation can exist for particular values of fermion mass. In this the infrared asymptotics of gluon propagator is to be $1/(k^2)^2$ in the gauges under consideration. Possible interpretation of the results is discussed in application to the problem of dynamical quark mass generation.

58461 **(IFVE-OTF—81-75) Scattering at fixed angles with account for exchange interaction.** Kostenko, O.F.; Troshin, S.M.; Tyurin, N.E. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

In the framework of single-time equation for the scattering amplitude (relativistic equation of quantum theory of damping) angular dependence of the cross section has been calculated. The results are compared with the existing data for πN scattering. The geometrical picture for the scattering at angles close to 0 deg and 180 deg and essential role of the forward and backward interaction radii are being discussed.

58462 **(IFVE-OTF—81-79) Scaling violation in the heavy quark fragmentation functian.** Avaliani, I.S.; Kartvelishvili, V.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

The scaling violation in the heavy quark fragmentation functions is analysed in the framework of the leading logarithmic approximation in QCD and it is shown, that the slaling violation effects are more essential for heavy quarks, than for light ones. These results indicate that the D-meson inclusive spectra measurement is a sensitive test for some standard assumptions.

58463 **(IFVE-OTF—81-96) Quark-parton model and charge-exchange reaction at large momentum transfer.** Solov'ev, L.D.; Shchelkachev, A.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702704.

A good description for exclusive π^-p charge-exchange reactions at -t>=3 (GeV/c)^2 and psub(lab.)>25 (GeV/c) is received by means of the simple quark parton model. This model permits to use the information from inclusive reactions and deep inelastic eh-scattering in order to describe the exclusive hadron reactions. Some predictions for charge exchange cross sections at large momentum transfer are received. The comparison of the model with the experiment gives the possibility to determine the quark structure functions for π^0 and eta mesons.

58464 **(IFVE-OTF—81-99) Doublet composite schemes of leptons and quarks.** Pirogov, Yu.F. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 15p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702522.

All simplest doublet composite schemes are classified. Four different doublet schemes are shown to be available. A new scheme with charge doublet Q=(2/3, -1/3) rather advantageous as compared with the previous ones is being considered. Some difficulties in interpreting the colour as an effective symmetry are pointed out.

58465 **(IFVE-OTF—81-103) Invariant current algebra on the light cone and deep inelastic lepton-hadron scattering. Part 1.** Lunev, F.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

Invariant current algebra on the light cone is formulated. Commutation relations of electromagnetic hadron currents are obtained. Cross section constraints for deep inelastic electron-hadron scattering are considered.

58466 **(IFVE-OTF—81-116) Mean associative multiplicities in deep inelastic processes.** Dzhaparidze, G.Sh.; Kiselev, A.V.; Petrov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702018.

The associative hadron multiplicities in deep inelastic and Drell--Yan processes are studied. In particular the mean multiplicities in different hard processes in QCD are found to be determined by the mean multiplicity in parton jet.

58467 **(IFVE-OTF—81-143) ν/sub (μ)/N$\to\mu^-$Nπ reactions in the hard pion model.** Bel'kov, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 16p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

The νsub(μ)N$\to\mu$sup(-)Nπ reaction has been considered in the phenomenological chiral Lagrangian approach in the hard pion model. The absence of other isobars in the νsub(μ)p$\to\mu$sup(-)pπsup(+) channel but Δ_{33} isobar allows one to carry out analysis of this process in the framework of the model. Numerical estimations of contributions of various diagrams in total cross sections of νsub(μ)N$\to\mu$sup(-)Nπ reactions from the threshold to the 1.5 GeV energy are given. The analysis of the data of the reactions νsub(μ)N$\to\mu$sup(-)Nπ as well as the check of the theory of broken chiral symmetry may provide useful informations about π^-, rho- and A_1 meson interaction with low-lying baryon resonances.

58468 **(IFVE-OTF—81-157) Average multiplicities in hard processes.** Dzhaparidze, G.Sh.; Kiselev, A.V.; Petrov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 11p. NTIS (US Sales Only), PC A02/MF A01.

Hadron production in deep inelastic lepton-hadron scattering is investigated. Multiplicities have been considered in various hard processes. The multiplicity in a parton jet defines these above in a universal way. Particularly an asymptotic equality is obtained for an average number of target and current fragmentation products in deep inelastic scattering.

58469 **(INIS-mf—7099) Electric quadrupole moments and strong interaction effects in pionic atoms of ^{165}Ho, ^{175}Lu, ^{176}Lu, ^{179}Hf and ^{181}Ta.** Olaniyi, B.; Shor, A.; Cheng, S.C.; Dugan, G.; Wu, C.S. (British Columbia Univ., Vancouver (Canada). TRIUMF Facility). May 1981. 26p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82780696.

The effective quadrupole moments Q sub(eff) of the nuclei of ^{165}Ho, ^{175}Lu, ^{176}Lu, ^{179}Hf and ^{181}Ta were accurately measured by detecting the pionic atom 5g-4f x-rays of the elements. The spectroscopic quadrupole moments, Q sub(spec), were obtained by correcting Q sub(eff) for nuclear finite size effect, distortion of the pion wave function by the pion-nucleus strong interaction, and contribution to the energy level splittings by the strong interaction. The intrinsic quadrupole moments, Q_0, were obtained by projecting Q sub(spec) into the frame of reference fixed on the nucleus. The shift, epsilon$_0$, and broadening, GAMMA$_0$, of the 4f energy level due to the strong interactions between the pion and the nucleons for all the elements were also measured. Theoretical values of epsilon$_0$ and GAMMA$_0$ were calculated and compared to the experimental values. The measured values of Q_0 were compared with the existing results in muonic and pionic atoms. The measured values of epsilon$_0$ and GAMMA$_0$ were also compared with existing values.

58483 (INIS-mf—7116, pp vp) **Hyperon physics.** Tovey, S.N. (Melbourne Univ., Parkville (Australia). School of Physics). 1982. NTIS (US Sales Only), PC A05/MF A01.

From 9. AINSE nuclear physics conference; Melbourne, Australia (8 Feb 1982).

58484 **(INP—1109/PH) Projectile fragmentation in hadron-nucleus collisions at high energies.** Bialas, A.; Czyz, W. (Institute of Nuclear Physics, Krakow (Poland)). 1980. 39p. NTIS (US Sales Only), PC A03/MF A01.

Particle production in hadron-nucleus collisions at high energies is discussed in the projectile fragmentation region. The predictions of the constituent quark model and of the multiple scattering models are analyzed and compared. The contribution of diffractive interactions is explicitely taken into account. Comparison with the recent Fermilab measurements shows good agreement with the quark model and strong effects of diffractive collisions in some of the analyzed reactions.

58485 **(ITEF—77(1981)) Introduction to quantum chromodynamics. Deep inelastic scattering of leptons on nucleons.** Voloshin, M.B. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1981. 62p. (In Russian). NTIS (US Sales Only), PC A04/MF A01. Order Number DE82702019.

In the framework of lectures on quantum chromodynamics deep inelastic scattering of leptons on nucleons is considered. To describe the deep inelastic scattering a formal approach of field theory is applied. In the framework of a parton model the process of lepton pair production is investigated. The cross section of the process is determined. At great values of four momentum transfer to hadrons by leptons the difference from the parton model have been observed, which are explained by quantum chromodynamics. These differences logarithmically depend on the q value.

58486 **(ITEP—78(1980)) Hadronic mass-relations from topological expansion and string model.** Kaidalov, A.B. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1980. 16p. NTIS (US Sales Only), PC A02/MF A01.

Hadronic mass-relations from topological expansion and string model are derived. For this purpose the space- time picture of hadron interactions at high energies corresponding to planar diagrams of topological expansion is considered. Simple relations between intercepts and slopes of Regge trajectories based on the topological expansion and q anti q-string picture of hadrons are obtained.

58487 **(ITEP—79(1980)) Electromagnetic form-factors of hadrons at large Q^2 and effects of confinement.** Kaidalov, A.B. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1980. 8p. NTIS (US Sales Only), PC A02/MF A01.

The importance of the nonperturbative effects for the behaviour of electromagnetic form factors of hadrons at large Q^2 is emphasized. In the framework of the topological expansion and the colour tube model it is demonstrated, that the dependence of form factors on Q^2 is determined by the intercepts of Regge-trajectories. The perturbation theory is used in order to take into account the effects connected to the hard gluon emission. Good description of the magnetic form-factor of nucleon is obtained.

58488 **(ITEP—89(1981)) SU(3)-mixing of the S-wave dibaryon resonance.** Badalyan, A.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1981. 10p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702316.

The Gell-Mann-Okubo mass formula is used to predict unambiguously $^1S_0$ resonances in the $\Sigma\Sigma$ channels (I=2) near $\Sigma\Sigma$ threshold. It is shown that the linear mass formula is compatible with the existence of the $^1S_0$ threshold resonances in many dibaryon systems which enter the 27 representation. The $^3S_1$ threshold resonances, $p\Lambda$ (M approximately equal to 2054 MeV) and $N\Sigma$ (I=1/2, M=2129 MeV), are considered as members of 8a and 10^* with the mixing angle THETA determined by the mass of the $\Sigma^+ \Xi^0$ resonance ($^3S_1$, I=3/2).

58489 (ITEP—96(1981)) Mechanisms of forward-backward spectator asymmetry in low-energy anti pD annihilation. Kondratyuk, L.A.; Shmatikov, M.Zh. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1981. 16p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702317.

The mechanisms producing the forward-backward asymmetry of the proton-spectator in the low-energy anti pD annihilation are considered. The single mechanism which could give the experimentally observed asymmetry is the real part of the anti pp elastic scattering amplitude. Existing experimental data on the asymmetry can be described assuming the existence of a D-wave anti pp resonance with the mass approximately equal to 1980 MeV.

58490 (ITF—80-122P) Problem of three strongly interacting particles, two of which are charged. Kharchenko, V.F.; Shadchin, S.A. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1980. 32p. (In Russian). Information Dept., Institute for Theoretical Physics-252130, Kiev-130, USSR.

The integral equations for the system of three particles, two of which are charged, are reformulated - separating out explicitly from the kernel all the singularities that arise due to the presence of the long-range Coulomb pair interaction. The kernel of the regularized set of equations (Faddeev-Noble's type equations) is determined by the solution of an auxiliary problem. The developed formalism allows one to define the finite nuclear-Coulomb scattering length of a particle by two other particles in a bound state. The equations obtained are valid at all energies of the three-particle system.

58491 (JINR—E-2-81-251) Dynamics of colour in hadron-diffraction on nuclei. Kopeliovich, B.Z.; Lapidus, L.I.; Zamolodchikov, A.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1981. 4p. NTIS (US Sales Only), PC A02/MF A01.

Hadron-nucleus elastic and inelastic diffraction scattering is treated by means of the eigenstate method, in which all the inelastic shadowing corrections can be effectively summed up. The hadron-nucleon scattering amplitude is calculated in the Born approximation to the QCD. It is shown that a statement about abnormality small absorption of diffractive dissociation products inside the nucleus is a result of ignoring the inelastic shadowing.

58492 (JINR—E-2-81-486) Lowest order electroweak corrections to spin 1/2 fermion scattering. 2. The one-loop amplitudes. Bardin, D.Yu.; Christova, P.Ch.; Fedorenko, O.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 16p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702239.

A calculation of the one-loop electroweak corrections to scattering of spin 1/2 fermions within the Weinberg-Salam like theory started elsewhere is continued. A renormalization scheme, based on a natural choice of input parameters, i.e., electron charge e and masses of all particles (Msub(W), Msub(Z), Msub(chi) and fermion masses msub(f)), is considered in detail. This scheme is generalized for the theory with an arbitrary unitary mixing of fermion fields.

58493 (JINR—E-2-81-548) Proton structure functions at large transfer momenta and its description in a model with the quark-amplitude factorizability assumption. Linkevich, A.D.; Skachkov, N.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 4p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702705.

The shape of structure functions of deep inelastic scattering of electrons on nucleons is found. To this end the dynamical model of factorizing quark amplitudes is used. It is shown that the BCDMS experimental (NA-4) data at Q^2 approximately 30-170 GeV^2 and the data of the earlier SLAC experiment at a $Q^2 <= 20$ GeV^2 are well described by the dynamical model of factorizing quarks (DMFQ).

58494 (JINR—R-2-81-217) Eta → 3π and eta → $\pi^0 \gamma\gamma$ decays in chiral theory. Volkov, M.K. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 5p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702020.

The widths of the eta → $3\pi^0$ and eta → $\pi^0\gamma\gamma$ decays are evaluated to a higher-than-ever degree of accuracy in the chiral model corresponding to the U(3)xU(3) group. The mass matrix with three arbitrary parameters corresponding to the masses of u, d and s quarks is used. The mixing angle is also asumed to differ from zero, and evaluations have been made at its two possible values: -10 deg and -18 deg. For the eta → $3\pi^0$ decay the following GITA values are obtained: GITA(-18 deg) = 0.28 keV; GITA(-10 deg) = 0.22 keV. For the eta → $\pi^+\pi^-\pi^0$ decay: GITA(-18 deg) = 0.17 keV, GITA(-10 deg) = 0.14 keV. The values are well consistent with available experimental data. For the eta → $\pi^0\gamma\gamma$ decay: GITA(-18 deg) = $1.6\text{x}10^{-3}$ eV, GITA(-10 deg) = $1.3\text{x}10^{-3}$ eV. The values are substantially less than the rough theoretical evaluations available and differ by four order of magnitude from old experimental data. However, the latest measurements performed at the Institute of high energy physics (Serpuchov), do not contradict the values.

58495 (JINR—R-2-81-369) Minimized economical interactions. Ghiordanescu, N.; Stavinskij, V.S. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1981. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

The idea of economical interaction is suggested according to which inclusive particle production in extremal situations is determined by minimum possible total energy of colliding constituents. Experimental data on cumulative production cross sections of pions and kaons depending on minimum possible interacting constituents energy are given. It is shown that inclusive reactions of various types, cumulative processes at large orders of cumulativity and processes with large transverse momenta are described by an unit universal function of minimum possible total energy of colliding constituents, minimized masses of which are determined by kinematics of inclusive particle production.

58496 (JINR—R-2-81-481) Meson structure functions and covariant wave functions of quark bound states. Kapshaj, V.N.; Linkevich, A.D.; Savrin, V.I.; Skachkov, N.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 13p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

The problem of describing deep inelastic scattering of leptons on pseudoscalar meson is discussed. A meson is considered as a bound state of scalar quark and antiquark of the same mase which interact by means of scalar gluon exchange. Formulae of the structure functions of composite two-particle systems through relativistics single-time wave functions of the constituent relative motion are obtained. A new scaling variable is introduced. It is found that an exact solution of the equation for the wave function with the interaction kernel taken in the form of the one-gluon exchange amplitude leads to a power violation of scaling.

58497 (JINR—R-2-81-552) Radiative corrections to the $\nu N \rightarrow \nu X$ process. Bardin, D.Yu.; Dokuchaeva, V.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702523.

Within the framework of the Weinberg-Salam theory and the quark-parton model of strong interaction radiative corrections to deep inelastic muonless neutrino scattering $\nu N \rightarrow \nu X$ are estimated. It is shown that making allowance of radiative corrections at data analysis for Rsub(ν(anti ν)) = σsub(ν(anti ν))sup(NC)/σsub(ν(anti ν))sup(CC) could result in decreasing sinsup(2)thetasub(w) parameter by approximately 5%.

58498 (JINR—R-2-81-553) **Simulation of baryon like quark bound states with $V(r)=-g^2r^{-1}(1-a^2r^2)$.** Bogolyubskij, I.L.; Bogolyubskaya, A.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1981. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702706.

Baryon like bound states of large number of quarks having the same "flavour" and different "colours" are investigated in the Hartree-Fock approximation, when pair attractive potential is $V(r)=-g^2r^{-1}$ $(-a^2r^2)$. All the quarks are assumed to be in the same spin state. The coordinate part of wave function is assumed to have the samplest factorized form. An arising integrodifferential eigenvalue problem is solved by transformation to sixth order nonlinear differential equation. By means of computer localized solutions of this equation are investigated and among them solutions of considered eigenvalue problem corresponding to the ground and excited bound states are picked out. The results are compared with the analogous ones obtained by the authors previously for the cases of purely Coulomb and linear attractive potentials.

58499 (JINR—R-2-81-557) **Approximate solution of QCD evolution equations with radiative corrections.** Bednyakov, V.A.; Zlatev, I.S.; Isaev, P.S.; Kovalenko, S.G. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1981. 23p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702707.

The QCD equations in the second-order approximation on the $g^2(Q^2)$ effective coupling constant of strong interaction which descri Q^2-evolution of nucleon quark and gluon distribution functions are solved approximately. The initial conditions for this equations cannot be evaluated in the QCD perturbation theory. It is calculated using phenomenological quark-gluon model of nucleon structure. The distribution functions are found in an explicit analytical form. The comparison with experimental data is carried out.

58500 (JINR—R-2-81-729) **Unified model of multiple production of hadrons in various processes at high energies.** Kalinkin, B.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 17p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702021.

A mechanism is proposed for the dynamic confinement of colour. On its basis a statistical model is constructed for the multiple production of hadrons at high energies. It well describes the main characteristics of this process in hadron interactions, e^+e^- annihilation, deep inelastic lepton-nucleon scattering, and in reactions with the production of particles with large transverse momenta. This model does not contradict the data on multiple production at superhigh energies.

58501 (KEK—80-14, pp 43-47) **Study of proton-proton and deuteron-proton interactions by a bubble chamber.** Shimizu, F.; Katayama, N.; Sai, F. (Tokyo Univ. (Japan)). Feb 1981. (In Japanese). NTIS (US Sales Only), PC A07/MF A01.

From Workshop on high energy nuclear studies at KEK; Oho, Ibaraki, Japan (16 Dec 1980).

A preliminary report on the analysis of bubble chamber data at the energy of 1.35 and 1.55 GeV/c is described. The purpose of this study is to investigate the behavior of π production cross section in p-p interaction. The total elastic cross sections are 25.0 mb at 1.35 GeV/c and 25.5 mb at 1.55 GeV/c. The cross-sections of π-production such as $pp\text{-}pn\pi^+$ and $pp\text{-}pp\pi^0$ were directly obtained. The values were 11.9 mb for $pn\pi^+$ and 3.5 mb for $pp\pi^0$ at 1.35 GeV/c, and 17.3 mb for $pn\pi^+$ and 4.7 mb for $pp\pi^0$ at 1.55 GeV/c. The values of $pp\pi^0$ did not agree with previously reported data at high energy. In the production of $(\text{delta})^{2+}$ in the $pp\text{-}pn\pi^+$ reaction, Monte Carlo calculation explains well this mass distribution. A preliminary experiment of dp reaction was done at the deuteron energy of 2 GeV/c. The tagging of spectator will be done.

58502 (KMU-HEP—81-01) **Monte-Carlo-code BAMJET to stimulate the fragmentation of quark-antiquark jets.** Ritter, S. (Karl-Marx-Universitaet, Leipzig (German Democratic Republic). Sektion Physik). Jan 1981. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702022.

A computer code BAMJET (Baryon-Meson JET) in Fortran language is described. The code BAMJET simulates the fragmentation into hadrons of quark-antiquark systems produced in positron-electron-annihilation processes on the basis of a chain decay model. The programme treats also the fragmentation of charmed quarks. In detail all subroutines are described, the most important input and output variables and fields are listed. Besides the flow diagramm of the code BAMJET the results of the simulation are tabulated.

58503 (KMU-HEP—81-05) **Gauge vector boson pair production at antipp collider energies.** Hellmund, M.; Ranft, G. (Karl-Marx-Universitaet, Leipzig (German Democratic Republic). Sektion Physik). Aug 1981. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702023.

Within the standard SU(2)xU(1) model differential cross sections and angular distributions of all polarization states are studied for all channels of gauge vector boson pairs accessible in hadron hadron collisions, W^+W^-, Z^0Z^0, $Z\gamma$, ZW, γW. The zero in the unpolarized angular distribution of qantiq → $W\gamma$ is confirmed. The origin of this Mikaelian zero is studied. None of the other channels exhibits a zero in the unpolarized angular distribution, but strong minima at cos theta = 0 are predicted for qsub(i)antiqsub(j) → $Z\gamma$ and qsub(i)antiqsub(j) → ZW^+. These are of different origin than the Mikaelian zero. Simple structure functions suggest that these minima are seen in pantip collisions.

58504 (KMU-HEP—81-06) **Production of polarized baryons in polarized and unpolarized e^+e^- collisions.** Ranft, J.; Ranft, G. (Karl-Marx-Universitaet, Leipzig (German Democratic Republic). Sektion Physik). Sep 1981. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702024.

Polarized and unpolarized e^+e^- annihilation is considered in lowest order at energies 30 to 150 GeV taking γ and Z^0 exchange in the standard SU(2)xU(1) model into account. The fragmentation of polarized quarks into polarized baryons is described by two kinds of fragmentation functions; the first is based on SU(6) weights and empirical expressions for favoured and disfavoured fragmentation; the second is based upon a Monte Carlo model of the chain decay including helicities of quarks and hadrons. From the cross sections for e^+e^- → qantiq and the fragmentation functions we obtain predictions for the baryon polarization as function of the collision energy and of kinematical variables.

58505 (LPC—81-22) **Eikonal corrections to hard processes.** Bordes, G.; Nicolaidis, A. (College de France, 75 - Paris. Lab. de Physique Corpusculaire). 1981. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702026.

We consider within Quantum Chromodynamics those semi-inclusive hard processes where two large mass scales appear. Summation of single and double logarithms arising from soft gluonic emission introduces eikonal form factors. We obtain a satisfactory agreement with recent experimental data on transverse momentum distribution of lepton pairs and acoplanarity distributions of hadrons at large transverse momenta.

58506 (NASA-TM—82450) **Adaptation of the TH epsilon mu formalism for the analysis of the equivalence principle in the presence of the weak and electroweak interaction.** Fennelly, A.J. (National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center). Oct 1981. 40p. NTIS, PC A03/MF A01.

The TH epsilon mu formalism, used in analyzing equivalence principle experiments of metric and nonmetric gravity theories, is adapted to the description of the electroweak interaction using the Weinberg-Salam unified SU(2) x U(1) model. The use of the TH epsilon mu formalism is thereby extended to the weak interactions, showing how the gravitational field affects W sub mu (+ or -1) and Z sub mu (0) boson propagation and the rates of interactions mediated by them. The possibility of a similar extension to the strong interactions via SU(5) grand unified theories is briefly discussed. Also, using the effects of the potentials on the baryon and lepton wave functions, the effects of gravity on transition mediated in high-A atoms which are electromagnetically forbidden. Three possible experiments to test the equivalence principle in the presence of the weak interactions, which are technologically feasible, are then briefly outline: (1) K-capture by the FE nucleus (counting the emitted X-ray) (2) forbidden absorption transitions in high-A atoms' vapor and (3) counting the relative Beta-decay rates in a suitable alpha-beta decay chain, assuming the strong interactions obey the equivalence principle.

58507 (NBI-HE—81-50) Relevance of the 3q-annihilation and the radiative proton decay. Eeg, J.O.; Picek, I. (Niels Bohr Inst., Copenhagen (Denmark)). Dec 1981. 12p. NTIS (US Sales Only), PC A02/MF A01.

The branching ratio R = GAMMA($p \rightarrow e^+ \gamma$)/GAMMA($p \rightarrow e^+ \pi^0$) is calculated in the SU(5) model of grand unification within a pole model approach. The result is an upper limit R <approximately 10^{-3} and consequently the $p \rightarrow e^+ \gamma$ decay mode is not found to occur at an observable rate in experiments of the near future.

58508 (NBI-HE—82-4) Trial for analytic calculation of meson spectrum in SU(3) lattice QCD. Kawamoto, N.; Shigemoto, K. (Niels Bohr Inst., Copenhagen (Denmark)). Mar 1982. 22p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702708.

The low-lying meson spectrum including u, d, s and c quarks is studied by a random walk technique combined with strong coupling - mean field approximation. Hopping parameters as a function of the coupling constant are determined and compared with Monte Carlo results. The quark masses are also estimated.

58509 (NBI-HE—82-9) Redei-like model and testing Lorentz invariance. Nielsen, H.B.; Picek, I. (Niels Bohr Inst., Copenhagen (Denmark)). 1982. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702709.

The authors present an argument in support of a very simple and predictive model for noncovariant laws of nature. Provided the deviation from Lorentz invariance is still rotational invariant, a very predictive one parameter model is left. It results in the Redei-like behaviour of particle lifetimes, and selection rules are obtained which determine the most promising weak-decay experiment tests of Lorentz invariance. In this respect more accurate measurements of dominant charged pion and kaon decay modes are strongly encouraged.

58510 (PB—82-178468) On the transverse momentum distribution of quarks created in a flux tube. Bowler, M.G. (Oxford Univ. (UK). Nuclear Physics Lab.). 1981. 14p. NTIS, PC A02/MF A01.

In the Monte Carlo generation of mesons in jets initiated by quarts or gluons, the transverse momentum distribution of created quarks is usually chosen to be gaussian. The interpretation of the high meson transverse momentum tail, planar and three jet events in e(+)e(-) annihilation in terms of hard gluon bremmstrahlung is both qualitatively and quantitatively sensitive to this assumed distribution. In this note, the author estimates the transverse momentum distributions obtained when quarks are created in pairs within a flux tube, and concludes that the gaussian distribution is probably an entirely adequate representation.

58511 (PM—81/5) Threshold enhancements and resonant effects in exclusive $\gamma\gamma$ reactions. Layssac, J.; Renard, F.M. (Montpellier-2 Univ., 34 (France). Dept. de Physique Mathematique). May 1981. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82903362.

In connection with the rho rho enhancement recently observed at 1.6 GeV we estimate and discuss contributions of threshold effects and resonances to the cross-sections of several exclusive channels like $\gamma\gamma \rightarrow VV''$, $V\gamma$, eta $\pi\pi$, KK^* and πA_1.

58512 (RL—81-086) Hyperfine splittings of bag model gluonia. Barnes, T.; Close, F.E.; Monaghan, S. (Science Research Council, Chilton (UK). Rutherford and Appleton Labs.). Nov 1981. 22p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702027.

Order αsub(s) contributions to the energy shifts in gluonia are studied in the MIT bag model. The naive result that $M(0^{-+}) > M(0^{++})$ is preserved for αsub(s) <approximately 3, although $M(0^{-+}) < M(2^{++})$ results for αsub(s) >approximately 0.54. The 0^{-+} and 2^{++} can thus be identified with i(1440) and theta(1640) for reasonable values of αsub(s) and bag size, in which case the 0^{++} mass is predicted to be approximately 1.0 Gev.

58513 (RL—81-090) MIT bag can accommodate the theta (1640) and i(1440) as glueballs. Barnes, T.; Close, F.E.; Monaghan, S. (Science Research Council, Chilton (UK). Rutherford and Appleton Labs.). Nov 1981. 5p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702029.

QCD perturbation effects at O(αsub(s)) are studied for gluonia in the MIT bag. If αsub(s) > 0.54 then the 2^{++} is heavier than the O^{-+} in line with the theta(1640) and i(1440) states. The observed splitting and absolute magnitudes are consistent with a bag radius approximately equal to 1 fm. A scalar glueball is predicted at 1 GeV and may mix with S^* (980).

58514 (UM-P—81/42) Hybrid model for charmed meson decays. Gorman, R.; McKellar, B.H.J. (Melbourne Univ., Parkville (Australia). School of Physics). 1981. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702030.

It is shown that a hybrid model, combining the pole model and the c quark decay model, provides a reasonable description of the relative branching ratios and absolute decay rates for two body decays of charmed mesons.

58515 (UM-P—81/43) Electromagnetic decay widths for L=1, Jsup(PC)=1^{--} T-baryonia: II. Ellis, R.G.; McKellar, B.H.J.; Joshi, G.C. (Melbourne Univ., Parkville (Australia). School of Physics). 1981. 24p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702031.

The electromagnetic decay widths of the Jsup(PC)=1^{--}, L=1 T-baryonia in the 1-5 GeV region are estimated. The Van Royen-Weisskopf technique is extended to baryonia within the framework of the QCD potential model. The diquark and antidiquark are assumed to have finite extent. Potential dependent coefficients are scaled from known baryon and mesons.

58516 (UM-P—81/50) Phase consistency and dissociated wavefunctions of Q^4 anti Q baryons. Bickerstaff, R.P. (Melbourne Univ., Parkville (Australia). School of Physics). 1981. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702032.

It is demonstrated, using simple, algebraic techniques, that Strottman's dissociation of the Q^4-anti Q bag-model wavefunctions into ordinary baryon-meson coupled wavefunctions has not been done in a phase consistent manner.

58517 (WIS-Ph—82/1) Are quarks and leptons composite. Harari, H. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). Jan 1982. 57p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE82702524.

The possibility that quarks and leptons are composite was studied. A line of reasoning was pursued which followed several steps. The standard model was assumed and the need to go beyond it was demonstrated. Different classes of ideas were considered. The notion of compositeness and its general difficulties, mainly the scale problem, were studied. A connection between composite massless fermions and an unbroken chiral symmetry was assumed. A general framework based on hypercolor and a chiral symmetry was established. The general requirements for a candidate model were established. A minimal scheme was found and its successes and failures were studied.

58518 Coupled-channel interaction for intermediate-energy nucleon-nucleon reactions. Lomon, E.L. (Center for Theoretical Physics, Laboratory for Nuclear Science and Department of Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physical Review [Section] D: Particles and Fields;* 26: No. 3, 576-601(1 Aug 1982). Contract AC02-76ER03069.

General effects of coupling a system to higher-mass channels are reviewed. The dominant effect is the addition of an attraction which increases with energy up to and, when the coupled channel is not in an S state, beyond inelastic threshold. This can produce resonances whose widths and inelasticities are largely determined by the resonance position. A model is presented for nucleon-nucleon channels coupled to NΔ, NN*, or ΔΔ channels. It uses the Feshbach-Lomon nucleon-nucleon interaction and one-pion-exchange potentials plus phenomenological cores for the transition interactions. The width of the isobars is included. Good fits are obtained to NN channels for E/sub L/< or ≈1 GeV, including the "resonant" $^1D_2$ and $^3F_3$ partial waves. A structure may be present in the $^3P_0$ partial wave. In those partial waves where one-pion exchange predicts the largest transition potentials, the fit is improved by the long-range potential tails.

58519 Isospin relations by counting. Wohl, C.G. (Lawrence Berkeley Laboratory, Berkeley, California 94720). *American Journal of Physics;* **50**: No. 8, 748-753(Aug 1982). Contract W-7405-ENG-48.

A method is given for finding the relations between reaction cross sections or decay branching fractions that result from isospin conservation. The method was discovered long ago by Shmushkevich but is not widely known. It makes no call on the usual machinery of amplitude expansions and Clebsch—Gordan coefficients, but works instead by apportioning certain populations of particles according to a simple counting rule, the charge-uniformity rule. A number of examples, including several that require lengthy calculation to solve using Clebsch—Gordan coefficients, are here solved by inspection, usually without any equations at all.

58520 Twist-4 effects in electroproduction: Canonical operators and coefficient functions. Jaffe, R.L.; Soldate, M. (Center for Theoretical Physics Laboratory for Nuclear Science and Department of Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physical Review* [*Section*] *D: Particles and Fields;* **26**: No. 1, 49-68(1 Jul 1982). Contract AC02-76ER03069.

The interpretation of observed scaling violations in leptoproduction is complicated by the possible presence of significant higher-twist effects. We refine the machinery of the operator-product expansion sufficiently for a study of twist-4 effects. In particular, we introduce and review the advantages of a special, "canonical" basis. We demonstrate that the canonical basis is adequate for the necessary twist-4 perturbative calculations, and calculate the operator's tree-level coefficient functions in electroproduction. Our results establish a framework within which careful analysis of more accurate data can provide information regarding correlations among the constituents of the proton.

58521 Quantum-chromodynamic predictions for direct photons in e^+e^- collisions. II. Analysis of the third and fourth structure functions W-bar$_3$/sup γ/ and W-bar$_4$/sup γ/. Sasaki, K. (Fermi National Accelerator Laboratory, Batavia, Illinois 60510 and Department of Physics, Faculty of Education, Yokohama National University, Yokohama 240, Japan). *Physical Review* [*Section*] *D: Particles and Fields;* **26**: No. 1, 69-81(1 Jul 1982).

We analyze in quantum chromodynamics the timelike photon structure functions W-bar$_3$/sup γ/ and W-bar$_4$/sup γ/ which appear in the direct photon production in e^+e^- collisions, using the cut-vertex formalism and the renormalization-group method. It is found that W-bar$_3$/sup γ/ in leading order is not renormalized by the strong interactions and agrees with the result calculated in the simple parton model. The moments of W-bar$_4$/sup γ/ are calculated in the leading order. Then, the structure function is obtained by inverting the moments. The corrections to W-bar$_4$/sup γ/ by strong interactions are found to be large at small and large z.

58522 Analysis of the J/sup P/ = 1^+ three-pion system using a generalized Watson theorem for production of multiquark states. Longacre, R.S. (Brookhaven National Laboratory, Upton, New York 11976). *Physical Review* [*Section*] *D: Particles and Fields;* **26**: No. 1, 82-90(1 Jul 1982). Contract AC02-76CH00016.

We analyze the J/sup P/ = 1^+ three-pion production amplitudes obtained from the most recent diffractive, charge-exchange, and backward-production experiments. We have found effects in the amplitudes that we interpret in terms of qq-bar, q^2q-bar^2, and q^3q-bar^3 interactions. The qq-bar piece gives rise to the A_1 resonance whose parameters are M/sub A/$_1$ = 1230 +- 30 MeV and Γ/sub A/$_1$ = 330 +- 60 MeV, whereas the backward-production reaction shows a strong qq-bar and q^2q-bar^2 interference effect. The επ scattering couples only to the q^2q-bar^2 and q^3q-bar^3, and thus argues in favor of Jaffe's four-quark model of the ε.

58523 Quantum-chromodynamic jet masses in hadronic collisions. Clavelli, L. (High Energy Physics Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review* [*Section*] *D: Particles and Fields;* **26**: No. 1, 91-99(1 Jul 1982). Contract W-31-109-ENG-38.

In analogy to e^+e^- annihilation, we discuss the QCD predictions for the broadening of the forward-backward jets in hadronic collisions, in terms of the expectations for the corresponding invariant-mass spectra.

58524 High-twist production of prompt single photons at large transverse momentum. Berger, E.L. (High Energy Physics Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review* [*Section*] *D: Particles and Fields;* **26**: No. 1, 105-113(1 Jul 1982).

Quantitative predictions are presented for a specific hard-scattering reaction $\pi N \rightarrow \gamma X$ in which both the incident meson and the produced prompt photon couple directly in the QCD amplitude. The process leads to a highly constrained class of events at large p/sub T/ in which the photon momentum is balanced by that of a recoil quark jet, with no spectator jet of final-state particles emerging along the beam axis. Normalized absolutely in terms of the electromagnetic form factor of the pion, F/sub π/(Q^2), the cross section provides a lower bound on the total p/sub T/ $^{-6}$ high-twist contribution to the inclusive prompt photon yield.

58525 Predictions of left-right-symmetric grand unified theories. Caswell, W.E.; Milutinovic, J.; Senjanovic, G. (University of Maryland, College Park, Maryland 20742). *Physical Review* [*Section*] *D: Particles and Fields;* **26**: No. 1, 161-174(1 Jul 1982).

We present an analysis of renormalization effects for a class of grand unified theories which contain SU(2)/sub L/ x SU(2)/sub R/ x U(1) /sub B/-L left-right-symmetric low-energy electroweak model. Previously obtained predictions for the proton lifetime are improved at the two-loop level and we find 10^{32}< or =tau/sub p/ < or =10^{39} yr for 50< or =Λ/sub M/S< or =400 MeV (MS indicates the modified minimal-subtraction scheme). In addition, we calculate the quark-lepton mass ratios and the enhancement factors for all the leading baryon-number-violating operators. Implications of our results for the selection rules in baryon decay are also presented.

58526 Decays of weak vector bosons and t quarks into doubly charged Higgs scalars. Barger, V.; Baer, H.; Keung, W.Y.; Phillips, R.J.N. (Department of Physics and Astronomy, University of Hawaii at Manoa, Honolulu, Hawaii 96822). *Physical Review* [*Section*] *D: Particles and Fields;* **26**: No. 1, 218-222(1 Jul 1982).

We evaluate the decays of W^+ and Z^0 bosons into chi^{++}, the doubly charged member of the scalar triplet in the Gelmini-Roncadelli model in which spontaneously broken B-L symmetry gives Majorana masses to neutrinos. For M(chi^{++})<28 GeV, the branching fractions exceed 4% for $W^+ \rightarrow$chi^{++}chi$^-$ and 2% for $Z^0 \rightarrow$chi^{++}chi^{--}. Sequential chi$^{++} \rightarrow l_1^+ l_2^+$ leptonic decays could be substantially higher than previously recognized and could be dominant. Decay distributions for leptons of this origin are calculated for p-barp colliders. We also evaluate t→bchi^{++}chi$^-$ decay.

58527 Hydrogen-antihydrogen oscillations, double proton decay, and grand unified theories. Arnellos, L.; Marciano, W.J. (Department of Physics, University of Illinois, Chicago, Illinois 60680). *Physical Review Letters;* **48**: No. 25, 1708-1711(21 Jun 1982).

The ΔB = ΔL = 2 processes of hydrogen-antihydrogen oscillation and $pp \rightarrow e^+e^+$ or $\mu^+\mu^+$ (double proton decay) in grand unified theories are examined. Although these reactions are very suppressed in the minimal SU(5) model, their rates may be significantly increased by appending a 50-plet of Higgs scalars. In that case relatively light color sextet and doubly charged colorless scalars might mediate $pp \to e^+e^+$ or $\mu^+\mu^+$ at a rate observable in ongoing proton decay experiments. Consequences of this scenario are discussed.

58528 **Baryon masses in a relativistic quark-diquark model.** Lichtenberg, D.B.; Namgung, W.; Predazzi, E.; Wills, J.G. (Physics Department, Indiana University, Bloomington, Indiana 47405). *Physical Review Letters;* **48**: No. 24, 1653-1656(14 Jun 1982).

Masses of ground-state spin-3/2 baryons are calculated in a relativistic quark-diquark model with a potential motivated by QCD. The parameters of the model are determined by fitting vector-meson masses, and so the calculation for baryons contains no free parameters. Results are in rather good agreement with experiment. Moreover, starting from dynamical quark masses close to the so-called current masses, effective quark masses are obtained in the right range to be identified with constituent masses.

58529 **Possible evidence for substantial nonperturbative quantum-chromodynamic effects.** Barnett, R.M. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review Letters;* **48**: No. 24, 1657-1659(14 Jun 1982). Contract AC03-76SF00515.

A search for nonperturbative effects in the structure functions of deep-inelastic scattering reveals substantial effects which could be due to important physical phenomena or to systematic errors in the experiments. In either case the measurements of α/sub s/ and Λ are seriously jeopardized. $F_2(\mu N)$, $F_2(\nu N)$, and $xF_3(\nu N)$ are examined.

58530 **Bounds on M/sub Z//sub 1,2/ in any SU(2)/sub L/xSU(2)/sub R/xU(1)/sub B/-L gauge model.** Barger, V.; Ma, E.; Whisnant, K. (Department of Physics and Astronomy, University of Hawaii at Manoa, Honolulu, Hawaii 96822). *Physical Review Letters;* **48**: No. 23, 1589-1592(7 Jun 1982). Contract AM03-76SF00235;AC02-76ER00881.

In the known fermions transform under SU(2)/sub L/ xSU(2)/sub R/xU(1)/sub B/-L, then the two neutral vector gauge bosons must satisfy the bounds 83 GeV<M/sub L/1<116 GeV and M/sub Z/2>200 GeV. In addition, if mixing is negligible for the two charged vector gauge bosons, then 75 GeV<M/sub W/ 1<97 GeV. These results come directly from analyzing existing experimental data and do not depend on any further theoretical assumptions, such as the value of g/sub L//g/sub R/ or the choice of Higgs—boson representations.

58531 **Neutrinoless double-beta decay and muonium-antimuonium transitions.** Halprin, A. (Physics Department, University of Delaware, Newark, Delaware 19711). *Physical Review Letters;* **48**: No. 19, 1313-1316(10 May 1982).

The effective coupling for muonium-antimuonium transitions is calculated from analogous couplings obtained in recent analyses of nuclear double beta decay. An effective four-fermion coupling as large as 10G/sub F/ is found, which should be experimentally accessible with use of muonium in vacuum.

58532 **Questions in a microscopic theory of pion production/absorption.** Banerjee, M.K. (University of Maryland, College Park, Md. 20742). *AIP (American Institute of Physics) Conference Proceedings;* **79**: No. 1, 37-46(10 Mar 1982).

In this talk we show that in the treatment of nuclear processes involving pions, such as pion production/absorption or exchange currents, one should use for the πNN vertex function $g\pi(q^2)\gamma_5$tau/sub α/, where q is the pion four-momentum and g/sub π/(m^2/sub π/)≃13.4 is the pion-nucleon couping constant. The result is independent of the form and details of any interaction Lagrangian. We show that the difference between g/sub π/(q^2)$\gamma_5$tau/sub α/ and the fully dressed πNN vertex function contributes to amplitudes involving more bosons, e.g., scattering amplitudes ($\pi N \to \pi N$), production amplitudes ($\pi N \to \pi\pi N$), etc. Such contributions are mediated through either seagull terms or P11 intermediate states. We point out that it is neither necessary nor practical to calculate these partial contributions to scattering and production amplitudes. One can always exploit other approaches, theoretical and phenomenological, to make reasonably good models for the full amplitudes.

58533 **Quarks in nuclei.** Miller, G.A. (University of Washington, Seattle, WA 98195). *AIP (American Institute of Physics) Conference Proceedings;* **79**: No. 1, 47-57(10 Mar 1982).

A brief discussion of the relevance of quark degrees of freedom in Nuclear Physics is presented. Pertinent aspects of bag models of baryons are reviewed, and a six-quark bag model study of the reaction $pp \to d\pi^+$ is made.

58534 **Implications of mass-dependent renormalization group parameters for conventional QCD phenomenology.** Edwards, B.J. (Argonne National Lab., IL (USA). High Energy Physics Div.); Gottschalk, T.D. (California Inst. of Tech., Pasadena (USA)). *Nuclear Physics [Section] B;* **196**: No. 2, 328-364(8 Mar 1982).

The effects of quark mass dependence in the momentum-subtracted beta function and anomalous dimensions of quantum chromodynamics are investigated. We examine the sensitivity of predicted quark and gluon moments for deep inelastic scattering to changes in the prescriptions used in defining the mass-dependent renormalization group parameters and we discuss interpretations of the resulting differences. Simple algorithms are presented in which the mass-dependent evolution of parton moments and the effective coupling can be approximated by massless formulae with carefully chosen thresholds for exciting additional quark flavors. We examine the expected nature of heavy quark components in the nucleon's sea, with particular attention given to the strange and charmed sea. The inherent scheme dependence in the definition of heavy quark parton distributions is also discussed.

58535 **Infrared properties of a quark gas.** Kapusta, J.I. (Los Alamos Scientific Lab., NM (USA)). pp 395-403 of Statistical mechanics of quarks and hadrons. Proceedings of an International Symposium. Satz, H. (Bielefeld Univ. (Germany, F.R.). Fakultaet fuer Physik) (ed.). Amsterdam, Netherlands; North-Holland (1981).

From International symposium on statistical mechanics of quarks and hadrons; Bielefeld, F.R. Germany (24 Aug 1980).

The infrared properties of a quark gas at finite density are studied using renormalization-group-improved perturbation theory. The running coupling constant shows color charge screening in the infrared region with no Landau pole. Asymptotic freedom is recovered in the ultraviolet region which allows one to relate the scale parameter Λ, as determined by scattering experiments, to the running coupling constant in the many-body system. Possible ambiguities of the perturbation expansion in the many-body system are discussed.

58536 **Issues in massive lepton pair production in hadronic interactions - 1980.** Berger, E.L. (Argonne National Lab., IL (USA)). pp 71-96 of Elementary constituents and hadronic structure. Proceedings v.1 of the 15. Rencontre de Moriond, les Arcs, 9 - 21 Mar 1980. Tran Thanh Van, J. (ed.). Dreux, France; Editions Frontieres (1980).

From 15. Rencontre de Moriond; Les Arcs, France (9 Mar 1980).

A discussion is presented of issues of current importance in the theory and phenomenology of massive lepton pair production in hadronic interactions. The relevance of higher-twist inverse-power terms for all constituent scattering processes is emphasized.

58537 **(PB—82-161555) Hyperfine splittings of bag model gluonia.** Barnes, T.; Close, F.E.; Monaghan, S. (Science and Engineering Research Council, Chilton (UK). Rutherford Appleton Lab.). [nd]. 27p. (RL—81-086). NTIS, PC A03/ MF A01.

Recently there has been an upsurge of interest in gluonia - color singlet bound states of two or more gluons - and speculation that low lying 0(-+) and 2(++) states may already have been manifested at 1440 and 1640 MeV. The MIT bag model has been cited as a guide to gluonium masses; it yields degenerate 0(++), 2(++) states at about 1 GeV and 0(-+), 2(-+) states at about 1300 MeV before hyperfine splitting effects arizing from single gluon exchange and the four gluon interaction are included. The recently developed formalism for QCD perturbation theory in a finite spherical cavity enable the effects of gluon exchange to be computed directly. This is now applied to gluonia.

58538 **(ITEF—66(1980)) Instanton solutions in chiral models.** Perelomov, A.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1980. 43p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702236.

The review of instanton solutions in two-dimensional chiral models of the field theory is presented. The simplest chiral model - the n vector -field model is considered. Main attention is given to the study of instanton solutions in the case of common chiral models. The properties of instanton solutions in the CPsup(n) model are briefly discussed.

58539 **(ITEP—73(1981)) Rishon gauge theory.** Okun, L.B. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1981. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702238.

Rishon model with SU(3)sub(H) x SU(3)sub(c) gauge symmetry is investigated. Corollaries of the global U(6)-symmetry of this model are discussed. Two and three rishon states are studied. The strong instability of the proton and the existence of light sextet quarks is revealed.

58540 **(JINR—R-2-81-249) Symmetries, conservation laws and invariant solutions of nonlinear evolution equations.** Mel'nikov, V.K. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 19p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701965.

An infinite-dimensional commutative group of invariance of all equations obtained from the condition of consistency of first-order matrix operators has been found. It is shown that the local conservation laws derived earlier follow just from these symmetries. Equations for invariant solutions are considered, and the group of symmetry and first integrals of these equations are found.

58541 **Preon models with dynamical symmetry breaking.** Schellekens, A.N.; Kang, K.; Koh, I. (Fermi National Accelerator Laboratory, P. O. Box 500, Batavia, Illinois 60510). *Physical Review [Section] D: Particles and Fields;* **26**: No. 3, 658-673(1 Aug 1982). Contract AC02-76ER03130.

We have investigated all composite models based on complex, anomaly-free, and asymptotically free representations of the gauge groups SU(3) to SU(8), SO(4N+2), and E_6, with not more than two different preons. We discuss in detail the role of Fermi statistics in the determination of the (meta)flavor representations of the composites. Under certain assumptions about the possible ground states, the solutions to 't Hooft's anomaly equations are presented for the complete flavor group and all non-Abelian subgroups, to which the flavor group can break. We find several models which satisfy anomaly matching when the flavor group is broken by the simplest condensate.

58542 **Hydrogen-antihydrogen oscillations and spontaneously broken global B—L symmetry.** Mohapatra, R.N.; Senjanovic, G. (Physics Department, The City College of the City University of New York, New York, New York 10031). *Physical Review Letters;* **49**: No. 1, 7-10(5 Jul 1982). Contract AC02-76CH00016.

Within the framework of an SU(2)/sub L/xU(1)xSU(3)/sub c/ gauge model with suitably extended Higgs sector, the possibility of oscillations between neutral matter and antimatter, such as neutron-antineutron and hydrogen-antihydrogen systems, is discussed. This model incorporates the spontaneous breakdown of global B—L symmetry associated with a Majoron, and as a result, a relation between n-n-bar mixing, H-H mixing, and the mass of the electron neutrino is obtained. With present limits on tau/sub n/-n-bar, tau/sub HhyphenH/> or $\approx 10^{13}$ yr is predicted.

58543 **Spontaneous breakdown and the scalar nonet.** Scadron, M.D. (Physics Department, University of Arizona, Tucson, Arizona 85721). *Physical Review [Section] D: Particles and Fields;* **26**: No. 1, 239-247(1 Jul 1982). Contract AC02-80ER10663.

In the context of the QCD quark model and on the basis of dynamical Bethe-Salpeter ladder graphs, we suggest that (i) the existence of the scalar q-barq hadron multiplet, like the pseudoscalar q-barq multiplet, is a direct consequence of dynamical spontaneous breakdown of chiral symmetry with a chiral-limiting nonstrange mass scale of m/sub sigmaNS//sup CL/ = 2m/sub dyn/ roughly-equal630 MeV, (ii) the lifting of the nonstrange σ-δ degeneracy is expected from the s-wave quark-gluon annihilation diagram, and (iii) the observed σ-S* mixing follows from the existence of the p-wave scalar quark-annihilation diagram. The resulting predicted 0q-barq nonet is then σ(750 MeV), κ(800), S*(980), and δ(985), in agreement with data for the resonant masses, the mixing angle, and also decay widths except for the κ(800).

58544 **Chiral lagrangian for deep mine physics.** Claudson, M.; Wise, M.B. (Harvard Univ., Cambridge, MA (USA). Lyman Lab. of Physics); Hall, L.J. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). *Nuclear Physics [Section] B;* **195**: No. 2, 297-307(15 Feb 1982).

The chiral lagrangian for baryon number violating nucleon decay is derived and applied to nucleon decays into strange and non-strange final states. The uncertainties in our predictions are discussed.

58545 **Classification of Wigner operators by a new type of weight space diagram.** Biedenharn, L.C. (Duke Univ., Durham, NC); Louck, J.D. pp 55-72 of Symmetries in science. Gruber, B.; Millman, R.S. (eds.). New York, NY; Plenum Publishing Corporation (1980).

The status of the use of the Wigner operator approach to unitary groups is reviewed. The main ideas, techniques and known results are sketched. The way in which the weight patterns for SU(3) appear as the classifying concept for a new family of polynomials defined by SU(3) canonical tensor operators is discussed in detail.

58546 **Weakly coupled fields: a more active view.** Ward, B.F.L. (Stanford Linear Accelerator Center, CA (USA); Purdue Univ., Lafayette, IN (USA). Dept. of Physics). *Nuovo Cimento [Sezione] A;* **48**: No. 3, 299-313(1 Dec 1978).

A more active formulation of the gauge-theoretic view of the weak and electromagnetic interactions of fundamental fermions is presented using as a guide the suppression, in nature, of certain matrix elements of strangeness-changing neutral currents between two single-hadron states and/or between a single-hadron state and the vacuum. The principal result of our formulation is that the observed rate for Ksub(L)→anti$\mu\mu$ allows us to predict, in the free-quark approximation, the value of (msub(KL) - msub(KS))/msub(K) within 10% by using the Quigg-Jackson bound.

From Conference on grand unified theories and related topics; Kyoto, Japan (29 Jun 1981).

The different parts of this paper are the following: lattice quantization; strong coupling expansions and mean field approximation; duality and topological excitations; roughening.

58548 **(CNRS-CPT—81-P-1316) Gluonic corrections to quark vacuum condensate contributions to two-point functions in QCD.** Pascual, P.; de Rafael, E. (Centre National de la Recherche Scientifique, 13 - Marseille (France). Centre de Physique Theorique). Jul 1981. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702225.

We present the gluonic corrections to quark vacuum condensate contributions to various types of current correlation functions. Their relevance to the first Weinberg sum rule is discussed. A new derivation of the relation between the A_1-mass and the q-mass is presented. The higher order corrections to the so-called non-perturbative quark mass are also discussed.

58549 **(CPT—81/P.1309) Characterization of the fundamental group of a differentiable manifold by the action of its group of diffeomorphisms.** Donato, P. (Centre National de la Recherche Scientifique, 13 - Marseille (France). Centre de Physique Theorique). Jul 1981. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82904029.

Portions of document are illegible.

Let X be a connected differentiable manifold and Diff(X) the corresponding group of diffeomorphisms. Starting from a construction of the universal covering space of the neutral component of Diff(X) we establish that the fundamental group of X is isomorphic with the group of components of the isotropy subgroup of a point under the transitive action of this covering on X.

58550 **(HU-TFT—81-31) Gauge hierarchies of the SU(N) grand unification.** Chaichian, M.; Kolmakov, N.Yu.; Nelipa, N. F. (Helsinki Univ. (Finland). Research Inst. for Theoretical Physics). 23 Oct 1981. 40p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702702.

Structure of spontaneous breaking of SU(N) gauge symmetry for grand unification is investigated. The obtained results are applied to the analysis of SU(8) symmetry for which possible ways of breaking and intermediate symmetries are considered. It is assumed that the SU(8) group unifies the subgroups of colour, standard electroweak and horizontal symmetries. We find conditions which are necessary to impose on the vacuum expection values of Higgs multiplets for providing arbitrary breaking pattern of SU(N) symmetry and conserving any intermediate symmetry. If in the considered SU(8) models fermions and mirror fermions do not violate the (V-A) and (V+A) structure of weak interactions, then their masses should not be greater than approx. 10^2 GeV. It is also shown that the contributions of fermion and scalar multiplets to the renormalization group equation for the coupling constant of any subgroup of SU(N) are identical. Renormalization group identities for the case of arbitrary SU(N) breaking are given. Using these identities one can calculate the value of the masses for the breaking of the intermediate symmetries in the SU(8) models, and also exclude part of the possible breaking patterns.

58551 **(IFVE-OTF—81-101) Collective coordinate method in the relativistic string theory.** Pron'ko, G.P.; Razumov, A.V.; Taranov, A.Yu. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 21p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702234.

Classical theory of a string is investigated by means of the collective coordinate method. The total solution of classical Hamiltonian equations of a string is given. For an open string a complete set of gauge invariant is derived. At the classical level the connection between two standard methods of string quantization is established. For a closed string a broad class of gauge invariant quantities is obtained.

58552 **(INFN/AE—80/1) Geometrical aspects of nonlinear sigma models.** Percacci, R. (Istituto Nazionale di Fisica Nucleare, Trieste (Italy); Trieste Univ. (Italy). Ist. di Fisica Teorica). 15 Mar 1980. 67p. Dep. NTIS (US Sales Only), MF A01. Order Number DE82902986.

Like general relativity and gauge theories, the nonlinear sigma models are examples of field theories with a geometric interpretation; their study involves the use of many ideas from the theories of harmonic maps, Lie groups, symmetric spaces, fibre bundles and differential geometry in general. The present work is intended to give an account of some of these aspects, together with an introduction to the mathematical tools which are necessary to understand them. It is focused essentially on two problems: derive various equivalent forms for the action functional, and give a global definition of nonlinear sigma model as a field theory defined on a nontrivial fibre bundle over spacetime. This broader definition allows the fields to have a state of twistedness and thus enlarges considerably the class of topological configurations of the model.

58553 **(INIS-mf—7116, pp vp) Su(2) Yang-Mills theory in (1+1)-dimensions: a finite lattice approach.** Hamer, C.J. (Australian National Univ., Canberra. Dept. of Theoretical Physics:. 1982. NTIS (US Sales Only), PC A05/MF A01.

From 9. AINSE nuclear physics conference; Melbourne, Australia (8 Feb 1982).

58554 **(INIS-mf—7116, pp vp) Grand unified models.** Kenny, B.G. (Western Australia Univ., Nedlands:. 1982. NTIS (US Sales Only), PC A05/MF A01.

From 9. AINSE nuclear physics conference; Melbourne, Australia (8 Feb 1982).

58555 **(JINR—E-2-81-294) Covariant three-dimensional equation for fermion-antifermion system. Part 1.** Skachkov, N.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701850.

A covariant three-dimensional equation is obtained for the fermion- antifermion wave function on the basis of the covariant Hamilton formulation of quantum field theory. The consideration is carried out in the framework of the diagram technique. Transition to the three-dimensional form is achieved through the use of variables of the Lobachevsky momentum space.

58556 **(JINR—E-2-81-499) Quantum nonlocal conserved charges for supersymmetric generalized nonlinear sigma models.** Zaikov, R.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702492.

It is shown that the higher nonlocal conserved charges for O(N) and O(N) x O(N) nonlinear sigma models survive in the case of quantization. The same is true also for any sigma model for which there exist the asymptotical states and dynamical mass generation.

58557 **(JINR—R-2-81-303) Contribution of the vacuum polarization into the abnormal electron magnetic moment and summation of the perturbation theory series.** Ilchev, A.S.; Mitryushkin, V.K. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 5p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702493.

A method is proposed to sum up asymptotic series of the perturbation theory, that is based on the finite convergence radius of the pertubation theory regularized series in some models of the field theory with fermions. In terms of the one-loop approximation in the quantum electrodynamics the contribution of vacuum polarization into the abnormal electron magnetic moment is explained into an asymptotic sign-constant series with factorially growing coefficients. The regularized series with a finite convergence radius is summed up. The expression obtained is analytically extended with respect to the interaction constant beyond the convergence radius, where the regularization is cancelled. It is noted, that the calculational scheme proposed can be employed in the two-loop, three-loop etc. approximation for the polarization operator.

58558 (JINR—R-2-81-401) Anomalous dimension quark counting in higher orders of QCD. Avaliani, I.S.; Matveev, V.A.; Slepchenko, L.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01.

The problem of the influence of QCD higher approximations on asymptotic behaviour of cross-sections of inclusive processes with great momenta transferred is studied. It is shown that the type of logarithmic factors characterizing deviation from inclusive cross sections scaling is determined by quark structure of hadrons and that the two-loop corrections counting in distribution functions and quark fragmentation does not destroy universality of the anomalous dimension quark counting.

58559 (KMU-HEP—81-08) Logarithmic asymptotics in quantum chromodynamics. Kirschner, R. (Karl-Marx-Universitaet, Leipzig (German Democratic Republic). Sektion Physik). Sep 1981. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702025.

Double-logarithmic and logarithmic contributions to the quark form factor and to quark scattering and annihilation amplitudes are summed in all orders. The main part of the single-logarithmic contributions can be absorbed into effective couplings.

58560 (NBI-HE—81-39) Two loop calculations for the propagators of gluonic currents jsub(PG)=αGsub($\mu\gamma$)sup(a)[Gsub(a)sup($\mu\gamma$)(mean)] and jsub(SG)=[$\beta(\alpha)/\alpha$]Gsub($\mu\gamma$)^2. Kataev, A.L.; Krasnikov, N.V.; Pivovarov, A.A. (Niels Bohr Inst., Copenhagen (Denmark)). Oct 1981. 21p. NTIS (US Sales Only), PC A02/MF A01.

The authors calculate two loop corrections to the propagators of gluonic currents jsub(PG)=αGsub($\mu\gamma$)sup(a)[G sub(a)sup($\mu\gamma$)(mean)] and jsub(SG)=[$\beta(\alpha)/\alpha$]Gsub($\mu\gamma$)^2. The results of the calculations are used for finding the connection between the characteristic scales of quark and gluonic worlds in perturbative QCD and estimate of the mass of the first radial excitation of eta'-meson (the authors obtain (msub(eta') = 1.45 GeV)).

58561 (NBI-HE—81-40) Dual models as saddle point approximations to Polyakov's quantized string. Durhuus, B.; Nielsen, H.B.; Olesen, P.; Petersen, J.L. (Niels Bohr Inst., Copenhagen (Denmark)). Oct 1981. 20p. NTIS (US Sales Only), PC A02/MF A01.

It is shown that if the metric becomes singular on the boundary, then Polyakov's quantized string theory has a saddle point. This leads to an off-shell Greens function, the S-matrix of which is the standard dual (Veneziano) model.

58562 (NBI-HE—81-41) Variational estimation of the mass gap in U(1) and SU(2) gauge theories in 2+1 dimensions. Patkos, A. (Niels Bohr Inst., Copenhagen (Denmark)). Oct 1981. 16p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702244.

A recently proposed variational Ansatz is used to compute plaquette-plaquette correlation functions. The results are compared to Monte Carlo values (SU(2)) and to a rigorous result of Goepfert and Mack (U(1)).

58563 (NBI-HE—81-42) Some comments on 't Hooft-Polyakov monopoles. Krasnikov, N.V. (Niels Bohr Inst., Copenhagen (Denmark)). Oct 1981. 11p. NTIS (US Sales Only), PC A02/MF A01.

The author describes a modification of the Georgi-Glashow model in which there are no 't Hooft-Polyakov monopoles. The main shortcoming of the proposed model is an absence of renormalizability. It is pointed out that even in the renormalizable models like SU(5), an account of quantum effects may lead to the lack of monopoles.

58564 (NBI-HE—81-48) Some approximate calculations in SU$_2$ lattice mean field theory. Hari Dass, N.D.; Lauwers, P.G. (Niels Bohr Inst., Copenhagen (Denmark)). Dec 1981. 44p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702245.

Approximate calculations are performed for small Wilson loops of SU$_2$ lattice gauge theory in mean field approximation. Reasonable agreement is found with Monte Carlo data. Ways of improving these calculations are discussed.

58565 (NBI-HE—81-52) Mean field with corrections in lattice gauge theory. Flyvbjerg, H.; Zuber, J.B.; Lautrup, B. (Niels Bohr Inst., Copenhagen (Denmark)). Dec 1981. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702246.

A systematic expansion of the path integral for lattice gauge theory is performed around the mean field solution. In this letter the authors present the results for the pure gauge groups Z(2), SU(2) and SO(3). The agreement with Monte Carlo calculations is excellent. For the discrete group the calculation is performed with and without gauge fixing, whereas for the continuous groups gauge fixing is mandatory. In the case of SU(2) the absence of a phase transition is correctly signalled by mean field theory.

58566 (NBI-HE—82-1) Confinement and magnetic condensation for N → infinity. Olesen, P. (Niels Bohr Inst., Copenhagen (Denmark)). Jan 1982. 27p. (CONF-811248—1). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702247.

From Conference on monopoles in quantum field theory; Trieste, Italy (11 Dec 1981).

The author discusses why magnetic condensation is necessary for confinement. Using the Makeenko-Migdal equation he then indicates that for N → infinity (in SU(N)) one has a condensate of magnetic strings in the QCD vacuum.

58567 (NBI-HE—82-2) Phase structure of SU/sub (n)/Z/sub (n) x SU/sub (n)/Z/sub (n)/ spin systems in two dimensions. Hari Dass, N.D.; Patkos, A.; Deak, F. (Niels Bohr Inst., Copenhagen (Denmark)). Jan 1982. 34p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702248.

The ground state of the two dimensional chiral adjoint spin systems is studied using the most general nearest neighbour ansatz for the eigenfunctions of the transfer matrix. The parameters entering this ansatz are determined variationally and the resulting phase structure is in close agreement with the results of Monte Carlo simulations.

58568 (NBI-HE—82-3) Polyakov's quantized string with boundary terms. II. Durhuus, B.; Olesen, P.; Petersen, J.L. (Niels Bohr Inst., Copenhagen (Denmark)). Jan 1982. 22p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702249.

Previously the authors computed boundary terms due to the conformal anomaly which are needed in Polkakov's method for calculating averages of functionals defined on surfaces. In this paper the authors complete the calculation so as to obtain the total action with all boundary terms in the bosonic case.

58569 (PB—82-177619) Experimental tests of gauge theories: lectures presented at the CERN-JINR joint school of physics, Hanko, Finland, 6-19 June 1981. Perkins, D.H. (Oxford Univ. (UK). Nuclear Physics Lab.). 1981. 84p. NTIS, PC A05/MF A01.

Our present thinking is that all theories of the interactions between the fundamental constituents of the universe are renormalizable gauge theories. In these lectures, the author's task is to try to critically assess the experimental evidence for this conclusion; to compare the data in detail with the predictions of the gauge theories of the electroweak and strong interactions; and to discuss the prospects for obtaining experimental evidence relating to the schemes (GUTs) unifying strong and electroweak interactions.

58570 (PM—81/11) Wave-function renormalization for coupled particles. Peyranere, M.C.; Talon, M. (Montpellier-2 Univ., 34 (France). Dept. de Physique Mathematique). 1981. 11p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82904244.

Formulas are given for conventional wave function renormalization of coupled systems of scalars, fermions, and vectors.

58571 (RL—81-087) Jets and tests of QCD in e^+e^- experiments. Marshall, R. (Science Research Council, Chilton (UK). Rutherford and Appleton Labs.). Jul 1981. 32p. (CONF-810760—20). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702028.

From International conference on high energy physics; Lisbon, Portugal (9 Jul 1981).

The current status of QCD tests using PETRA data is presented in three sections. The first section covers essentially qualitative comparisons using Q plots, thrust and psub(T) distributions and energy or momentum flow. The second section describes the quantitative determination of αsub(s) and the third section covers the scalar-vector tests of QCD.

58572 (RRK—80-15) Infrared singularity in the electron propagator in quantum electrodynamics. Harada, K.; Kubo, R. (Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics). Oct 1980. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702495.

Infrared singularity in the electron propagator is studied by means of the perturbation calculation exploited by Grammer and Yennie. The result agrees with those derived by nonperturbative methods. The difference between our result and the so-called exponentiation law is discussed together with the Ward-Takahashi identity.

58573 (VE—1-Preprint) New method of investigating some nonlinear spectral equations. Ushveridze, A.G. (AN Gruzinskoj SSR, Tbilisi. Inst. Fiziki). Feb 1981. 30p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702250.

Mathematical substantiation of previously proposed method of solution of nonlinear spectral equations arising at the investigation of instanton structure of scalar euclidian field theories with power nonlinearity is given. A series of sufficient conditions of existence of infinite multiplicity of solutions of nonlinear equations considered is established. Generalization for the case of nonlinear equations of the known in the theory of linear spectral equations principle of minima maximum is obtained. The possibility of using iterative methods of obtaining some solutions is proved. The mathematical apparatus used is taken from the field of modern functional analysis which is devoted to Sobolev embedding theorems and their application.

58574 (WIS-Ph—81/54) Anomaly equations and the persistent mass condition. Cohen, E.; Frishman, Y. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). Nov 1981. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702496.

Vector SU(Nsub(c)) gauge theories with nsub(f) flavors in the fundamental representation are considered. We prove that if the persistent mass condition is assumed, the two anomaly equations are identical and flavor independent for nsub(f)>=3. Integer solutions exist only for nsub(f)=2. The necessity of a separate discussion for 2<=nsub(f)<=Nsub(c) is explained.

58575 Real-space renormalization group: An adiabatic method of thinning high-frequency modes. Ben-Menahem, S. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review [Section] D: Particles and Fields;* **26**: No. 2, 455-467(15 Jul 1982). Contract AC03-76SF00515.

A new adiabatic method for improving iterative blocking-truncation approximations in lattice models is presented, and applied to a test model. In this approach, the high-frequency (fast) modes are frozen into wave functions that change with the slow modes.

58576 Operator-product expansion and vacuum instability. Gupta, S.; Quinn, H.R. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review [Section] D: Particles and Fields;* **26**: No. 2, 499-504(15 Jul 1982). Contract AC03-76SF00515.

This paper examines the operator product using the example of scalar field theories with unstable vacuums. We find that an operator-product expansion about the unstable vacuum, with the additional assumption that nontrivial operators subtracted with respect to this vacuum have nonvanishing expectation value in the physical vacuum, does not reproduce the predictions of the operator-product expansion about the stable vacuum, except for the leading-twist contribution. We discuss the implications of this for applications of the operator-product expansion in QCD.

58577 Conformally invariant quantization of the Liouville theory. Curtright, T.L.; Thorn, C.B. (Physics Department, University of Florida, Gainesville, Florida 32611). *Physical Review Letters;* **48**: No. 19, 1309-1313(10 May 1982).

The Liouville theory is quantized with use of Fock space methods, an infinite set of charges L/sub n/, n = 0, +- 1,..., is constructed which represents the conformal algebra in two dimensions, and consequences of this algebra are discussed. It is then argued, with use of variational methods in Fock space, that the spectrum of the Liouville Hamiltonian is continuous, and that there exist energy eigenstates obeying the constraints L/sub n/'E> = 0, n>0.

58578 Internal retardation. Grotch, H.; Kazes, E. (Pennsylvania State Univ., University Park (USA). Dept. of Physics); Rohrlich, F. (Syracuse Univ., NY (USA). Dept. of Physics); Sharp, D.H. (Los Alamos Scientific Lab., NM (USA)). *Acta Physica Austriaca;* **54**: No. 1, 31-38(1982).

It is suggested that the quantum electrodynamics of point particles be formulated as the point particle limit of a theory of extended particles, and that this limit be taken on the quantum level rather than the classical level. One is thus required to include the retarded interaction within the extended particle. In the nonrelativistic approximation, this method leads to a vanishing self-energy and to the absence of run-away and preacceleration effects, as has been shown previously. A comparison with the conventional perturbation methods of quantum electrodynamics is made.

58579 Measuring the scale parameter of quantum chromodynamics at CHEER. Krauss, L.M. (Massachusetts Inst. of Technology, Cambridge). *Canadian Journal of Physics;* **59**: No. 11, 1769-1773(1981). Contract AC02-76ER03069.

The possibility of measuring the scale parameter of quantum chromodynamics, Λ/sub s/, at CHEER is discussed. Rationale for the measurement of this quantity are given, along with a discussion of the theoretical difficulties involved. The measurement of the Q^2 dependence of structure functions and their moments, and methods of measuring α/sub s/ and its Q^2 evolution, are discussed, and arguments are given for the advantages and disadvantages of going to high Q^2 values at CHEER. It is concluded that while sensitivity to Λ is lowered at high Q^2, CHEER will, in principle, be able to provide the first clean measurements of Λ, free from almost all the theoretical confusion involved in interpretations of present data.

58580 (PB—82-161563) The MIT bag can accommodate the θ(1640) and I(1440) as glueballs. Barnes, T.; Close, F.E.; Monaghan, S. (Science and Engineering Research Council, Chilton (UK). Rutherford Appleton Lab.). [nd]. 9p. (RL—81-090). NTIS, PC A02/MF A01.

QCD perturbation effects at O (alpha sub s) are studied for gluonia in the MIT bag. If alpha sub s > 0.54 then the 2(++) is heavier than the 0(-+) in line with the theta (1640) and i (1440) states. The observed splitting and absolute magnitudes are consistent with a bag radius about 1 fm. A scalar glueball is predicted at 1 GeV and may mix with S*(980). (Copyright Science and Engineering Research Council 1981.)

This annual report contains extended abstracts about the work done at the named Institute, reports about accelerators and technical facilities of this Institute, and a list of publications. The scientific work concerns nuclear structure and nuclear reactions, high energy heavy ion physics, heavy ion atomic physics, nuclear solid state physics, solid-state track detectors, applications of nuclear methods and mass spectroscopy, the development of ion sources, instrumental developments, and interdisciplinary cooperation. See hints under the relevant topics.

58585 (INDC(NDS)—116/GandP(No.7)) **Progress in fission product nuclear data. Information about activities in the field of measurements and compilation/evaluations of fission product nuclear data (FPND).** Lammer, M. (International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee). Jun 1981. 191p. NTIS (US Sales Only), PC A09/MF A01. Order Number DE82702454.

This is the seventh issue of a report series on Fission Product Nuclear Data (FPND) which is published by the Nuclear Data Section (NDS) of the International Atomic Energy Agency (IAEA). The purpose of this series is to inform scientists working on FPND, or using such data, about all activities in this field which are planned, ongoing, or have recently been completed. The present issue contains also a section with some recent references relative to fission product nuclear data, which were not covered by the contributions submitted. The types of activities being included in this report are measurements, compilations and evaluations of: fission product yields (neutron induced and spontaneous fission); neutron reaction cross sections of fission products; data related to the radioactive decay of fission products; delayed neutron data of fission products; and lumped fission product data (decay heat, absorption etc.). The sixth issue of this series has been published in June 1980 as INDC(NDS)-113/G+P. The present issue includes contributions which were received by NDS between 1 August 1980 and 25 May 1981.

From Conference on large amplitude collective nuclear motion; Lake Balaton, Hungary (10 Jun 1979).

Individual items in scope for the data base were entered separately. (DLC)

58588 (INIS-mf—7102) **Annual report, 1980.** (Laval Univ., Quebec City (Canada). Lab. de l'Accelerateur van de Graaff). Dec 1980. 131p. (In French). NTIS (US Sales Only), PC A07/MF A01. Order Number DE82780707.

This report covers the period between Nov. 1, 1979 and Nov. 1, 1980. Work was carried out in the fields of pure and applied nuclear physics, atomic physics, and radiobiology. Thirty-four projects belonging to Laval researchers and twelve run by external users are under way. Thirty research subjects pursued during the year are described, and a list of publications is included.

58589 (INIS-mf—7103) **McMaster Accelerator Laboratory annual report, 1980.** (McMaster Univ., Hamilton, Ontario (Canada). Tandem Accelerator Lab.). 1980. 131p. NTIS (US Sales Only), PC A07/MF A01. Order Number DE82780708.

This Annual Report covers research carried out on the laboratory's three accelerators during the period November 1979 to October 1980. The contents include reports of the research completed or in progress during the year, a summary of the operation and development of the facilities, a list of persons associated with the laboratory and a list of publications for the last two years. A major new development during the year has been the development and use of a new multiplicity filter. This consists of a detector array built on the Lotus beam line together with the associated electronics to allow detection of mulitple gamma-ray coincidences. This allows study of high-spin states of rotational bands in nuclei. Measurements have allowed identification of bands in ^{159}Tm. A large part of the research programme has been based on reaction studies with beams of both polarized and unpolarized protons and deuterons. A short period of operation with a tritium beam took place in order to implant tritium in both Si(Li) and Ge(Li) detectors for further studies of the β-decay spectrum but no other experimental work took place with this beam. A major run with tritium is planned for early in 1981. There has been considerable collaboration with colleagues in other institutions with experiments being carried out at both McMaster and other institutions.

58590 (INIS-mf—7113) **Annual report 1981.** (Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Experimentalphysik). Dec 1981. 50p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82780697.

This annual report contains short descriptions of the work done at the named institute. These concern the study of hyperfine interactions, experiments with synchroton radiation, experiments at storage rings, and experiments at CERN. Furthermore, a list of publications, contributions to conferences and these is presented. (HSI).

58591 (INIS-mf—7116) **Ninth AINSE nuclear physics conference.** (Australian Inst. of Nuclear Science and Engineering, Lucas Heights). 1982. 83p. (CONF-820251—Absts.). NTIS (US Sales Only), PC A05/MF A01. Order Number DE82780693.

From 9. AINSE nuclear physics conference; Melbourne, Australia (8 Feb 1982).

Individual items from the conference were prepared separately for the data base. (GHT)

58592 (Juel-Spez—146) **Annual report 1981.** Gruemmer, F.; Mayer-Boericke, C.; Schult, O. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik). Mar 1982. 156p. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe, Germany, F.R.

This annual report contains extended abstracts about the work performed at the named Institute together with a list of publications, conference contributions, and internal reports. The work concerns nuclear reactions, nuclear spectroscopy, nuclear structure, solar energy, the isochronous cyclotron, the spectrometer BIG KARL, radiation detectors, software developments, electronic circuits, radiation protection, and mechanical design.

58593 (NP—2902902) **IKO annual report, 1980.** (Instituut voor Kernphysisch Onderzoek, Amsterdam (Netherlands)). 1980. 103p. NTIS (US Sales Only), PC A06/MF A01. Order Number DE82902902.

Research at IKO is described under the main headings: electron scattering, muon and hadron physics, nuclear theory, radio- and nuclear chemistry, accelerator technology, computer systems, and construction of the MEA electron linac. (WHK)

58594 (NP—2903252) **Annual report 1980. January 1980-December 1980.** (Tokyo Univ. (Japan). Inst. for Nuclear Study). 1980. 159p. NTIS (US Sales Only), PC A08/MF A01. Order Number DE82903252.

Portions of document are illegible.

This annual report reviews research activities and technical developments carried out at the Institute for Nuclear Study (INS) during the period January-December 1980. Studies on the nuclear structures and the nuclear reactions have been continued by use of the SF cyclotron (K = 68). Studies on (α, ^{6}He) two-neutron transfer reactions in ^{92}Zr and ^{208}Pb targets have revealed a unique feature of the reaction to study two-nucleon correlations in nuclei because of the predominant configuration in ^{6}He. Utilization of the heavy-ion beams has been extended: In taking advantage of the high-energy beam of LI ions from the SF cyclotron, the ^{16}O(^{6}Li, d)^{20}Ne reaction has been studied in illustrating effectiveness of the α-transfer process to the study of collective states. High-spin states of ^{28}Si were studied by α-angular correlations in the ^{12}C(^{20}Ne, α)^{28}Si*(α)^{24}Mg reaction, and the 8^+ and 10^+ states hitherto unknown have been identified. At the High-Energy Physics Division, studies on photoreactions have been continued by use of the 1.3-GeV electron synchrotron: search for di-baryon resonances in the $\gamma d \rightarrow pn$ process has been extended by measuring the asymmetry on a polarized deuterium target and also by measuring the differential cross sections by use of the tagged-photon system. Measurements on momentum spectra of protons from photo-nuclear reactions on Be and C were extended in the angular range. Measurements on proton polarization on $\alpha p \rightarrow \pi^0 p$ and differential cross sections for $\gamma p \rightarrow \gamma p$ at backward angle have been continued. At the Study Group for the Numatron Project, further studies on beam dynamics have been progressed by use of the Tarn, the test accumulation ring for the Numatron project, in which the beam of particles accelerated by the SF cyclotron was injected and accumulated.

58595 (IAE—3409/14) **Problems of formation of neutron-optical image with the help of very slow neutrons.** Frank, A.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1981. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702711.

The prospects for development of neutron optical systems (NOS) with very slow (the energy < or approximately 10^{-5} eV) and ultracold (< or approximately 10^{-7} eV) neutrons are discussed. Nuclear lenses (prisms), mirrors, magnetic lenses and diffraction optical elements are considered as the most suitable ones to perform three-dimensional neutron focussing. In order to offset the effect of gravitation on the image quality, such means as diffraction compensation of chromatic abberration, magnetic compensation of gravitation and multi-mirror systems are proposed. The neutron microscope is concluded to be technically feasible. Low intensity of the present-day very slow neutron sources is pointed out as the most substantial obstacle in putting the idea into practice.

58598 (ITEF—46(1981)) **Equipment of fast reversing of polarization of the polarized thermal neutron beam.** Gul'ko, A.D.; Ermakov, O.N.; Karpikhin, I.L.; Krupchinskij, P.A.; Kuznetsov, Yu.Eh.; Perepelitsa, V.F. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1981. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702202.

The spin-flip switch which is a part of equipment of fast reversing of polarization of the polarized neutron beam is described. The spin-flip switch consists of the master oscillator, spin-flip shaper power units, exposure timer, control unit. Basic circuits of above units are given and their performance is described. The switch assures the performance of various configurations of magnetic elements by the pre-set program. The switch generates as well control signals for external facilities of data accumulation from the detectors and synchronizes their performance with reversing of polarization orientation. The results of combined performance of the spin-flip switch with a beam bending magnet and wire current shielding are presented. The dependence of the degree of polarization on neutron detection time and the time from the start of blocking of the input of accumulation devices up to the end of blocking is measured. It has been found that at times exceeding 20 ms the polarization reaches its maximum value.

Thesis.

The aim of this thesis is the experimental determination of a tensor term in the optical potential for deuteron scattering. Starting from the lamb-shift principle a source of negative ions was developed which lies on a potential of up to 300 kV and yields beam of polarized H^- - e.g. D^- -ions for the injection into the tandemo for experiments with deuterons selectively a purely vector polarized one a purely tensor polarized beam is available. In the second part of this thesis the first measurements performed at the Munich accelerator with the polarized deuteron beam are presented. The author has studied the light, nondeformed nuclei with spin O: ^{4}He, ^{16}O, ^{36}Ar. For ^{4}He a very satisfactory description of all data in the framework of an optical model was found; not all so good agreement with the measured angular distributions could by obtained up to now for ^{16}O and ^{36}Ar, because the numerical analysis was constrained on the application of an only real tensor potential. The result of these analyses is a tensor potential strongly increasing with decreasing mass number. (orig./HSI).

58601 **Neutron-deuteron analyzing power measurements at 50 MeV. I. Backward angles.** Romero, J.L.; Ullmann, J.L.; Brady, F.P.; Carlson, J.D.; Fitzgerald, D.H.; Sagle, A.L.; Subramanian, T.S.; Zanelli, C.I.; King, N.S.P.; McNaughton, M.W.; Bonner, B.E. (Crocker Nuclear Laboratory and Department of Physics University of California, Davis, California 95616). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2214-2218(May 1982).

The analyzing power of polarized 50 MeV neutrons on deuterons has been measured for center-of-mass angles between 90° and 150°. The data, combined with forward angle measurements, are compared with recent p+d analyzing power measurements at 49.3 MeV and also with a three-body calculation at 46.3 MeV.

58602 **Differential cross section for the πi d→pp reaction from 80 to 417 MeV.** Boswell, J.; Altemus, R.; Minehart, R.; Orphanos, L.; Ziock, H.J.; Wadlinger, E.A. (University of Virginia, Charlottesville, Virginia 22901). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2540-2549(May 1982).

Differential cross sections were measured for the reaction, $\pi^+ d \rightarrow pp$, at seven energies, 80, 100, 140, 182, 230, 323, and 417 MeV. Sufficient data were taken for a 1% statistical uncertainty at eleven different angles for most of these energies. The elastic $\pi^+ p$ reaction was used to normalize the $\pi^+ d \rightarrow pp$ data. Legendre polynomial fits of the data are presented. The increased accuracy and energy of these data require an addition of a $\cos^6\theta^*$ term in the traditional low energy form of the differential cross section: $C(A+\cos^2\theta^*+B\cos^4\theta^*)$. The coefficients, A and B, are used to compare the present data with a survey of previous experiments and the theoretical work of Niskanen. Agreement is usually within uncertainties, but some disagreement remains even among recent experiments.

58603 **Deuteron spectrum in $np \rightarrow d(\pi\pi)^0$ at 1.46 GeV/c.** Hollas, C.L.; Newsom, C.R.; Riley, P.J.; Bonner, B.E.; Glass, G. (The University of Texas at Austin, Austin, Texas 78712). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2614-2618(May 1982).

Deuteron "missing mass" spectra have been measured at 1.46 GeV/c over the complete allowed phase space angular region for the $np \rightarrow d(\pi\pi)^0$ reaction. Strong enhancements, evidence for the Abashian-Booth-Crowe effect, are not observed near momenta corresponding to the two pion missing mass values. A total cross section of 28.5 +- 1.5 μb has been determined for this reaction.

58604 **Thermal neutron capture cross section of deuterium.** Jurney, E.T.; Bendt, P.J.; Browne, J.C. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2810-2811(May 1982).

We have measured the thermal neutron capture cross section of deuterium by direct observation of the prompt gamma ray.

58605 **Models of pion production and a quark model of the physics at short distance.** Kisslinger, L.S. (Carnegie-Mellon University, Pittsburgh, PA 15213). *AIP (American Institute of Physics) Conference Proceedings;* **79**: No. 1, 243-263(10 Mar 1982).

An isobar doorway treatment of the two-baryon plus core model is discussed, with sample results. Short distance properties of interacting hadrons are involved. A six-quark model for the short-range two-baryon current is presented, with application to electromagnetic interactions with deuteron targets and pion absorption.

(Mainz Univ. (Germany, F.R.). Fachbereich Physik). 15 Feb 1979. 82p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE82780698.

Thesis.

The experimental study of the reaction ^{19}F(p,α_0)^{16}0 was extended by a determination of the analysing power for the reaction in the energy range 454 keV <= Esub(p) <= 849 keV of the incident protons at laboratory angles thetasub(L) = 20° until 160°. By averaging of the proton spin angular distributions of the unpolarized cross section were also obtained. The angular distributions of these two observables were fitted by legendre polynomials. The results is a nonneglectable contribution of direct reactions and a new determination of a part of energylevels in ^{20}Ne. (orig./HSI).

Thesis.

In this thesis different aspects of the reaction $^{12}\text{C} + {}^{12}\text{C}$ were studied. The first part deals with high spin states in the mirror nucki ^{23}Na and ^{23}Mg experially with the states resonantly populated at Esub(cm) = 19.3 MeV. For the state at 9.80 MeV in ^{23}Na with (p,γ) angular correlation measurements a spin of $17/2^+$ and by Doppler form analysis a lifetime of (21 +- 9)fs was found. The probably analogous state at 9.61 MeV in ^{23}Mg decays both under p-emission to ^{22}Na and under γ-emission. Because of the p-decay probabilities to 3^+ and 4^+ of ^{22}Na, which were observed in (p,n) coincidence measurements, it has also the spin $17/2^+$. In the second part of this thesis it was studied whether the reaction $^{12}\text{C} + {}^{12}\text{C}$ at incident energies between 26 MeV and 42 MeV can be described using the statistical model. (orig./HSI).

58620 (INIS-mf—7177) **Radiation capture of negative pions from the 1s-level in ^{6}Li.** Renker, D. (Muenchen Univ. (Germany, F.R.). Fachbereich Physik). 20 Feb 1981. 46p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82780723.

Thesis.

The author has measured the γ-spectra for the reaction $^6\text{Li}(\pi^-,\gamma)^6\text{He}$ at pion momenta of 200 and 220 MeV/c. From the γ-spectra branching ratios for the transitions to the ground state and the first excited state in ^{6}He are obtained. (HSI).

58621 (INIS-mf—7179) **Study of the resonance behaviour of the systems $^{12}\text{C} + {}^{12}\text{C}$ and $^{14}\text{C} + {}^{14}\text{C}$.** Trombik, W. (Muenchen Univ. (Germany, F.R.). Fachbereich Physik). 11 Dec 1980. 142p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE82780724.

Thesis.

In the present thesis the resonant behaviour of the elastic e.g. inelastic scattering of $^{12}\text{C} + {}^{12}\text{C}$ and $^{14}\text{C} + {}^{14}\text{C}$ is studied. For the system $^{12}\text{C} + {}^{12}\text{C}$ the spin alignment Psub(zz) of the inelastic scattering $^{12}\text{C}(^{12}\text{C},^{12}\text{C})^{12}\text{C}^*(2^+$, 4.43 MeV) at six energies between 18.5 and 32.8 MeV (c.m.) is determined. The measurement was performed by coincident detection of particles and γ-quanta, whereby the γ detector was oriented in the direction of the scattering norm. The obtained Psub(z)sub(z)-values fluctuate strongly at the maxima of the excitation function (from +0.03 to +0.84) as at the minima (from -0.04 to +0.76). This result agrees neither with the predictions of the band crossing model (Abe) nor with the expectations of non-resonant models. At $^{14}\text{C} + {}^{14}\text{C}$ the elastic scattering at Esub(c.m.) = 6-35 MeV as well as the single or double inelastic scattering to 3^-(6.73MeV) from 15 to 35 MeV (c.m.) was measured. In the elastic 90°(c.m.) excitation functions strongly pronounced crude structures (width 2-3 MeV (c.m.)) are shown, which are similar to the scattering behaviour of $^{16}0 + {}^{16}0$ and can be qualitatively described by surface transparent optical potentials. By measurements of the angular distributions it could be shown, that at the maxima of the excitation function at 15.5, 19.5, 24, and 28 the partial waves L = 12, 14, 17, e.g. 18 dominate. In the inelastic scattering from about 25 MeV (c.m.) clearly intermediate structures were observed, but the absolute value of the cross sections lies at about one order of magnitude below that of $^{12}\text{C}^* + {}^{12}\text{C}(2^+)$ e.g. $^{12}\text{C}^*(2^+) + {}^{12}\text{C}^*(2^+)$. This result as well as the only weak appearance of intermediate structures in the elastic scattering leads to the conclusion of a weak coupling between ground state and the 3^--state. (orig./HSI).

58622 (INIS-mf—7180) **Studies on the radiative capture of heavy ions at the Munich heavy ion recoil spectrometer.** Konrad, P. (Muenchen Univ. (Germany, F.R.). Fachbereich Physik). 19 Nov 1980. 91p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE82780725.

Thesis.

The present thesis deals with the radiative heavy ion capture. Contrary to the capture of light ions to this only few and partly contradicting data exist. The used measuring methods partly allow only a nonsatisfying discrimination against the background from target impurities. The experiments were performed at the Munich tandem accelerator with the heavy ion recoil spectrometer which is optimally suited for measurements of this kind. It allows measurements at 0° relative to the beam direction and a complete identification of fusion products by nuclear charge, mass, and energy. With this it combines a high detection probability for these reactions with good discrimination possibility of disturbing reactions. At the reaction $^{16}O(^{32}S,^{48}Cr)\gamma$ at Esub(lab)(^{32}S) = 85 MeV no radiative capture could be observed. The found upper limit of sigmasub(γ) < 50 nb lies by more than 2 orders of magnitude below a cross section published for the same incident energy. The by oxygen impurities in the target less sensitive measurement of the reaction $^{14}N(^{30}Si,^{44}Sc)\gamma$ yielded sigmasub(γ) approx. <= 1 μb at Esub(lab)(^{30}Si) = 81.2 MeV. For this system also the radiative capture is much lower than published values. The experimental results are compatible with calculations using the compound-nucleus evaporation model, if for γ-transitions from the continuum the same reduced matrix elements are applied, as they are obtained from transitions between bound states in sd-shell nuclei in the mean. Collectively amplified transitions from the continuum which were suggested by some published high radiative capture cross sections do not occur in heavy ion reactions by these measurements. These statements are confirmed by recent results of other authors. (orig.).

58623 **(JINR-R—3-81-371) Spin dependence of S-wave neutron scattering cross section on ^{7}Li.** Alfimenkov, V.P.; Borzakov, S.B.; Vo Van Tkhuan; Mareev, Yu.D.; Pikel'ner, L.B.; Rubin, D.; Khrykin, A.S.; Sharapov, Eh.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1981. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702332.

The cross section for neutron scattering by ^{7}Li nuclei was measured at the IBR-30 reactor in the energy region up to 80 keV. In the experiment with polarized neutrons and polarized Li target there was determined the polarization cross section in the energy interval 2 eV-100 keV. Experimental results were analysed in the frame of the problem of existence of odd parity levels in ^{8}Li.

58624 **Excitation of low spin states in the $^{12}C(p,p')$ reaction at 800 MeV.** Haji-Saeid, M.; Igo, G.; Irom, F.; McClelland, J.B.; Pauletta, G.; Whitten, C.A. Jr.; Glashauser, C.; Cornelius, W.D.; Moss, J.M.; Thiessen, H.A.; Franey, M.A.; Gazzaly, M.; Love, W.G. (University of California, Los Angeles, California 90024). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 6, 3035-3042(Jun 1982).

Differential cross sections for the inelastic excitation of ^{12}C by protons have been measured at 0.8 GeV; the range of the angular distribution corresponds to momentum transfers of 0.7—2.4 fm^{-1} (1—3.3 m/sub π/). Data for the 1^{+}(T = 0), 1^{+}(T = 1), 2^{+}(T = 1), and the 2^{-}(T = 1) states at 12.71, 15.11, 16.11, and 16.58 MeV, respectively, have been obtained. These states, as well as the 2^{+}(T = 0) state at 4.44 MeV, provide a sensitive test of different parts of the effective N-N interaction at 0.8 GeV. We conclude that the differential cross sections for the ^{12}C excitations can be adequately described in the distorted-wave impulse approximation using a recently published t-matrix interaction.

58625 **Target mass dependence of isotensor double charge exchange: Evidence for deltas in nuclei.** Morris, C.L.; Fortune, H.T.; Bland, L.C.; Gilman, R.; Greene, S.J.; Cottingame, W.B.; Holtkamp, D.B.; Burleson, G.R.; Moore, C.F. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 6, 3218-3220(Jun 1982).

Measurements of forward-angle cross sections for double charge exchange on ^{16}O, ^{28}Si, and ^{40}Ca at 164 MeV incident pion energy suggest an A/sup -4/3/ dependence for the cross section. This A dependence is shown to provide evidence for Δ components in the nuclear wave function.

58626 **$^{7}Li(d,p)^{8}Li$ reaction cross section near 0.78 MeV.** Elwyn, A.J.; Holland, R.E.; Davids, C.N.; Ray, W. Jr. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2168-2173(May 1982). Contract W-31-109-ENG-38.

The total cross section for the $^{7}Li(d,p)^{8}Li$ reaction has been obtained at four energies near 0.78 MeV from measurements of the differential cross sections for the outgoing protons at laboratory angles between 20° and 155°. The average value, 146 +- 13 mb at an average deuteron energy of 0.781 MeV, is about 20% lower than the weighted mean of all previous absolute measurements. It is, however, in agreement with two other completely independent measurements, and the three experiments together provide a consistent (but lower) value for this important cross section.

58627 **Pion-nucleus inelastic scattering at 80 MeV.** Blecher, M.; Gotow, K.; Ng, R.; Burman, R.L.; Carlini, R.; Dam, S.; Hynes, M.V.; Leitch, M.J.; Sandberg, V.; Auble, R.; Bertrand, F.E.; Gross, E.E.; Obenshain, F.E.; Wu, J.; Blanpied, G.S.; Preedom, B.M.; Ritchie, B.G.; Bertozzi, W.; Kovash, M.A.; Redwine, R.P. (Virginia Polytechnic Institute and State University, Blacksburg, Virginia 24061). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2554-2562(May 1982).

80 MeV positive and negative pions inelastically scattered from targets of ^{12}C and ^{40}Ca have been studied at laboratory angles between 50° and 120°. Angular distributions are presented for scattering from the 4.44 MeV (2^{+}) state in ^{12}C, the 3.7 MeV (3^{-}), 13.4 MeV, and 17.5 MeV states in ^{40}Ca. The cross sections are compared with distorted wave calculations using potentials obtained from elastic scattering.

58628 **Kaon scattering from C and Ca at 800 MeV/c.** Marlow, D.; Barnes, P.D.; Colella, N.J.; Dytman, S.A.; Eisenstein, R.A.; Grace, R.; Takeutchi, F.; Wharton, W.R.; Bart, S.; Hancock, D.; Hackenberg, R.; Hungerford, E.; Mayes, W.; Pinsky, L.; Williams, T.; Chrien, R.; Palevsky, H.; Sutter, R. (Carnegie-Mellon University, Pittsburgh, Pennsylvania 15213). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2619-2637(May 1982).

Results from K^{+-} elastic and inelastic scattering from ^{12}C and ^{40}Ca are reported. The data were all taken at an incident momentum of 800 MeV/c over an angular range from 2 to 38° . The elastic data are compared to first-order optical model calculations in coordinate and momentum space; good qualitative agreement is obtained. The inelastic data (from ^{12}C only) are compared to distorted-wave Born approximation calculations, and good agreement is found if "realistic" inelastic transition densities are used. Although a first-order optical potential description does not describe the data fully, there are strong indications of the increased penetrability of K^{+} over K^{-} in this energy range.

58629 **Overview of experimental trends and systematics in pion production and absorption in nuclei.** Hoeistad, B. (Physics Department, University of Texas at Austin, Austin, Texas 78712, USA). *AIP (American Institute of Physics) Conference Proceedings;* **79**: No. 1, 105-129(10 Mar 1982).

An experimental overview of the (p,π) reaction on nuclei is given, emphasizing systematic behaviour in the data in general. Specific features in the data which point to nuclear structure dependence as well as in influence from the reaction dynamics are also discussed.

58630 **Pion production by target emission.** Gibbs, W.R. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *AIP (American Institute of Physics) Conference Proceedings;* **79**: No. 1, 297-317(10 Mar 1982). (CONF-8110152—).

From AIP conference on pion production and absorption in nuclei; Bloomington, IN, USA (22 Oct 1981).

The coherent production of pions in a proton nucleus collision is calculated. The energy region considered is below the nucleon-nucleon threshold so that the entire nucleus must take part in the process. The amplitude for this reaction is broken into two parts, the first part being characterized by initial emission of the pion from the projectile and the second part by initial emission from the target nucleus. It is the second part which is emphasized in this talk. The target nuclei ^{12}C and ^{209}Bi are considered. Total production cross sections as a function of energy and some angular distributions are calculated.

58631 **Resonances in heavy-ion collisions: experimental status.** Henning, W. (Argonne National Lab., IL). pp 75-99 of Dynamics of heavy-ion collisions. Cindro, N.; Ricci, R.A.; Greiner, W. (eds.). Amsterdam, Netherlands; North-Holland Publishing Company (1981). Contract W-31-109-ENG-38.

Experimental results are presented for studies of resonances in heavy-ion collision systems. Signatures of resonances, as observed in total reaction and total fusion cross sections, in elastic and inelastic scattering and in transfer reactions are discussed. Some selected examples are given for the extraction of resonance parameters and problems associated with such attempts. Emphasis is placed on recent results which indicate that resonance phenomena are observed in heavy-ion systems with compound nuclei extending well into the f-p shell.

58632 **(AD-A—111573/2) Recoil distributions in some proton reactions. Memorandum report.** Langworthy, J.B. (Naval Research Lab., Washington, DC (USA)). 29 Jan 1982. 19p. (NRL-MR—4731). NTIS, PC A02/MF A01.

The distributions of recoil products from the two most important double decays of silicon excited by proton absorption are calculated by analytical and numerical methods. The nuclear reactions treated are Si(p, p alpha) and Si(p, 2p) and it is assumed the decays are by evaporation. Conversion of the results to distributions of dose is discussed. The latter distributions are of interest in the soft upset of satellite electronic memories.

58633 **(CEA-N—1466(Pt.6)) Cross sections of nuclear reactions induced by protons, deuterons, and alpha particles. Pt.6. Phosphorus.** Tobailem, Jacques. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service d'Electronique Physique). Nov 1981. 27p. (In French). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702322.

Cross sections are reviewed for nuclear reactions induced by protons, deuterons, and alpha particles on phosphorus targets. When necessary, published experimental data are corrected, and, when possible, excitation functions are proposed.

58634 **(DOE/ER/40048—14L2) ^{26}Al/sup g,m/ production cross sections from the ^{23}Na(α,n)^{26}Al reaction.** Norman, E.B.; Chupp, T.E.; Lesko, K.T.; Schwalbach, P.; Grant, P.J. (Washington Univ., Seattle (USA)). 1981. Contract AC06-81ER40048. 24p. NTIS, PC A02/MF A01. Order Number DE82020145.

Cross sections have been determined for the production of ^{26}Al/sup g,m/ from the ^{23}Na(α,n) reaction. Total ^{26}Al production cross sections were obtained from measurements of the thick-target neutron yield. ^{26}Al/sup m/ cross sections were measured using an activation technique. ^{26}Al/sup g/ cross sections were deduced by subtracting the ^{26}Al/sup m/ cross sections from the total (α,n) cross sections. The principle of detailed balance has been applied to the low energy data to obtain cross sections for the astrophysically interesting ^{26}Al/sup g/(n,α_0)^{23}Na reaction. These results are compared with the results of Hauser-Feshbach calculations.

58635 **(EFI—291(16)-78) Hole excitations of the ^{31}P nucleus.** Kocharova, Zh.L. (Erevanskij Fizicheskij Inst. (USSR)). 1978. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702310.

The analysis of the available data on spectroscopic information about hole excitation of ^{31}P nucleus is carried out. The data are obtained from two types of experiments: 1) from pick-up reactions (such as (p,α), (α,^{3}He), (^{3}He,α)); 2) from quasielastic knock-on reactions (e,e'p) and (p,2p). This two types of experiments give in a number of cases various energy positions of hole states. The advantages and deficiences of each type of those experiments were discussed and possible reasons of disagreements were indicated. The interpretation of the ground and low-lying excited states of ^{31}P nucleus is given from the comparison of theoretical and experimental data on spectroscopic characteristics of ^{31}P nucleus levels.

Thesis.

The present thesis deals with the spectroscopy of the gamma radiation from the reaction fragments after binary reactions in the systems ^{16}O + ^{27}Al, ^{48}Ti, and ^{58}Ni at incident energies from 90 to 100 MeV, i.e. far above the Coulomb threshold. ΔE-E telescopes, which were located at 35° to the beam direction, detected the projectile-like fragments and defined the reaction channel and the scattering plane. In coincidence to this the gamma quanta in a 120-cm^3-Ge(Li)-diode and a 27 x 33-cm-NaI-spectrometer were observed. The gamma spectra are equal to those observed hitherto in fusion reactions except for the high energetic gamma lines from the ejectiles, which are raised from the gamma continuum of the heavy fragments. From the spectroscoped gamma radiation for the light as for the heavy fragments the excitation energy, the value of the fragment angular momentum, as well as the occupation of the magnetic sublevels could be determined. The hard projectile ^{16}O transfers the dissipated energy and the angular momentum transferred by the spin of the fragments nearly completely into the residue nucleus. The probability for the observation of a ground state transition in one of the heavy fragments extends to (0.85 +- 0.10) per carbon ejectile in the system ^{16}O + ^{48}Ti. The residue nucleus distribution corresponds to that expected by the statistical model from the decay of the compound-nucleus ^{52}Cr belonging to the ejectile ^{12}C, the excitation energy of which corresponds to the reaction Q-value. (orig./HSI).

58642 **Measurement of "subthreshold" production of K^- and antiprotons in relativistic nuclear collisions.** Shor, A.; Ganezer, K.; Abachi, S.; Carroll, J.; Geaga, J.; Igo, G.; Lindstrom, P.; Mulera, T.; Perez-Mendez, V.; Sagle, A.; Woodard, D.; Zarbakhsh, F. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Physical Review Letters;* **48**: No. 23, 1597-1600(7 Jun 1982). Contract AC03-76SF00098;AM03-76SF00010.

The observation of subthreshold production of K^- in the reaction $^{28}Si+^{28}Si$ at 2.1 GeV/nucleon is reported. For production at O^0 and 1 GeV/c, a K^- cross section ($d^2\sigma/dp\ d\Omega$) of 1.6 mb sr^{-1} $(GeV/c)^{-1}$ and an upper limit for p-bar production of 3 nb sr^{-1} $(GeV/c)^{-1}$ were measured. Calculations incorporating the effects of nuclear Fermi momentum underpredict the K^- yield by more than a factor of 20. Production mechanisms involving collective effects and equilibration are discussed.

Mathematisch-Naturwissenschaftliche Fakultaet). 15 Dec 1979. 147p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE82780699.

Thesis.

In the framework of a systematic study which is also important for certain cosmological questions a series of integral excitation functions of p- and α-induced nuclear reactions on target elements 22 <= Z <= 28 were determined using the stacked-foil technique. The irradiations were performed at the isochronous cyclotron Julic as well as the compact cyclotron CV 28 of the nuclear research establishment Juelich. Basing on earlier work which was limited on protons with energies between 12 and 45 MeV the energy range from 3 to 17 MeV was also studied. Hereby 17 excitation functions for the target elements Ti, V, Fe, Co and Ni could be determined. The measured sigma values correspond to the behaviour expected from earlier studies and confirm furthermore the observations of that time concerning considerable contributions by complex particles in the low energy range.

58651 **(JINR-R—1-81-258) Search for decays of superdense nuclei in a two-meter propane chamber.** Abdivaliev, A.; Zubarev, A.N.; Korzhev, N.A.; Kochurov, A.G.; Nikitin, A.V.; Pechenov, V.N.; Smirnov, N.A.; Sokolov, V.P.; Solov'ev, M.I.; Troyan, Yu.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1981. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702331.

The upper limits of the cross sections for productions of superdense nuclei are determined on the level of $5x10^{-33}$-10^{-28} cm^2 at irradiating $_{28}Ni^{58}$, $_{82}Pb^{208}$, $_{29}Cu^{63}$, $_{73}Ta^{181}$, targets with $_6C^{12}$ protons with 1.90; 3.36; 9.80 GeV/c momenta; with α particles of 0.95 GeV/c nucleon momentum, with carbon nuclei of 3.36 GeV/c nucleon momentum. Positron spectra from the decay of superdense nuclei are given. Estimations of the probability of superdense nuclei decays are presented.

58652 **Light-ion emission in heavy-ion collisions: Beam energy dependence.** Auble, R.L.; Ball, J.B.; Bertrand, F.E.; Ferguson, R.L.; Fulmer, C.B.; Lee, I.Y.; Robinson, R.L.; Young, G.R.; Wu, J.R.; Wells, J.C.; Yamada, H. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review [Section] C: Nuclear Physics;* **25**: No. 5, 2504-2511(May 1982). Contract W-7405-ENG-26.

Light ions with Z = 1, 2 and velocities greater than the beam velocity, produced in collisions between carbon and nickel nuclei, are studied using ^{12}C beams with energies between 7.5 and 16 MeV per nucleon. Energy spectra and angular distributions are reported and excitation functions derived from these data are presented. Integral cross sections for protons with velocities greater than the beam velocity are found to be insensitive to the beam energy. A model in which particles are emitted by an excited source, moving with a velocity approximately one-half that of the beam, is found to be capable of reproducing most of the data.

58653 **Large angle elastic and inelastic scattering of protons from ^{40}Ca at 800 MeV.** Bleszynski, E.; Bleszynski, M.; Hajisaeid, S.; Igo, G.J.; Irom, F.; McClelland, J.B.; Pauletta, C.; Rahbar, A.; Wang, A.T.M.; Whitten, C.A. Jr.; Adams, G.; Barlett, M.; Hoffmann, G.W.; McGill, J.A.; Boudrie, R.; Kyle, G. (University of California, Los Angeles, California 90024). *Physical Review [Section] C: Nuclear Physics;* **25**: No. 5, 2563-2573(May 1982).

Measurements are reported for the elastic and inelastic scattering of 800 MeV protons from ^{40}Ca. Differential cross sections were measured out to 42° while analyzing powers were obtained out to 30°. The angular distributions are diffractive in character at all angles. Theoretical analysis of the data was carried out in the framework of the diffraction multiple scattering theory. The following results were obtained: (i) Diffraction multiple scattering theory reproduces the data qualitatively out to the large momentum transfers. (ii) For the ground state density distribution <r/sub p/ ²>/sup 1/2/-<r/sub n/ ²>/sup 1/2/ = 0.142 +- 0.075 fm is obtained and the analysis favors the value of the correlation length ξ/ sub c/ = -0.5 fm. (iii) The excitation of the lowest-lying collective states (3^-, 5^-, 2^+) was analyzed using one-phonon excitation macroscopic parameters. The values of the β_2, β_3, β_5 parameters obtained agree quantitatively with lower energy (p,p′) scattering results.

58654 **Elastic scattering of πi and π^- from ^{40}Ca at 64.8 MeV.** Dam, S.H.; Edge, R.D.; Preedom, B.M.; Hamm, M.; Burman, R.L.; Carlini, R.; Redwine, R.P.; Yates, M.A.; Blecher, M.; Gotow, K.; Bertrand, F.E.; Gross, E.E.; Moinester, M.A. (University of South Carolina, Columbia, South Carolina 29208). *Physical Review [Section] C: Nuclear Physics;* **25**: No. 5, 2574-2582(May 1982).

Angular distributions of π^+ and π^- elastic scattering on ^{40}Ca at 64.8 MeV are presented. The data are analyzed using a first-order, nonlocal optical model based on a Kisslinger t matrix with an off-shell form factor. This model is unable to fit the data for any value of the off-shell parameter α unless the nuclear matter radius is allowed to vary from that derived from electron scattering. The resulting best-fit radii are as much as 0.40 fm larger than the electron scattering value for π^+ and 0.55 fm larger for π^-. For a given α the π^- best fit radius is also consistently larger by about 0.2 fm than that for π^+. In addition, the fits show no significant preference for any value of α between 400 and 900 MeV/c. Inclusion of the normally omitted second-order potential terms in the optical model does not significantly alter the results.

58655 **Spin-orbit deformations deduced from analyzing powers for inelastic neutron scattering from ^{54}Fe, ^{56}Fe, ^{58}Ni, ^{60}Ni, ^{120}Sn, and ^{208}Pb.** Guss, P.P.; Floyd, C.E.; Murphy, K.; Howell, C.R.; Pedroni, R.S.; Honore, G.M.; Pfutzner, H.G.; Tungate, G.; Byrd, R.C.; Walter, R.L.; Delaroche, J.P. (Department of Physics, Duke University, Durham, North Carolina 27706). *Physical Review [Section] C: Nuclear Physics;* **25**: No. 5, 2854-2857(May 1982).

Analyzing powers A/sub y/(θ) for inelastic scattering of 10-MeV neutrons to the first excited states of ^{54}Fe, ^{56}Fe, ^{58}Ni, ^{60}Ni, ^{120}Sn, and ^{208}Pb have been measured at a few selected angles. These data were analyzed using a coupled channels code in which the full Thomas form of the spin-orbit potential is assumed. The magnitudes of the observed spin-orbit deformations, which were found to be similar to those for (p,p′) in each case, contradict recent suggestions based on microscopic nuclear structure considerations.

58656 **(EFI—476(19)-81) Charge distributions of prodUcts from the spallation of intermediate mass nuclei by photons in Esub(γsub(max)) <= 4,5 GeV.** Grigoryan, E.O.; Demekhina, N.A. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 19p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702325.

Charge distributions of the residual nuclei produced in the process of the medium-weight target spallation in the mass region 51<=A<=93 by Esub(γsub(max))<=4.5 GeV photons of bremsstrahlung spectrum are investigated. The study of the characteristics of the charge distribution curves, the comparison with the data of hadron-nucleus reactions allowed to clear up some regularities of the residual nuclei production conditioned by their nucleon composition, to predict the probability of the unmeasured product yields. The character and properties of isobaric and mass distribution of the yields have been discussed as compared with the cascade-evaporation model calculations.

58657 **(INIS-mf—7176) Coulomb-nuclear force interference in the system ^{32}S + ^{60}Ni. Experiments and semiclassical analysis.** Dannhaeuser, G. (Muenchen Univ. (Germany, F.R.). Fachbereich Physik). 14 Jul 1980. 119p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE82780722.

Thesis.

For the reaction ^{60}Ni(^{32}S,^{32}S*)^{60}Ni* using particle-γ-coincidences the excitation functions of ^{32}S($2^+{}_1$) and ^{60}Ni($2^+{}_1$) for projectile energies of 70-100 MeV as well as with Si single counters the angular distribution of the elastically and inelastically scattered ^{32}S ions for incident energies of 90, 95, and 100 MeV were measured. A comparison of the measurements with the results of different computer codes led to following results: 1.) At the determination of the static quadrupole moment Q_2 of ^{32}S using the reorientation effect the influence of the nuclear force can be neglected for projectile energies Esub(P) <= 72 MeV. 2.) For the static quadrupole moment of ^{32}S the value Q_2 = -0.18 +- 0.04 eb was found. (Hereby destructive interference with the virtual excitation of the $2^+{}_2$-state is assumed). 3.) For projectile energies Esub(P) >= 72 MeV at which the excitation by nuclear forces was small against the Coulomb excitation, an evaluation of the excitation function of ^{32}S($2^+{}_1$) by the semiclassical code NCL, which regards the influence of the nuclear interaction approximatively, yielded values for the static quadrupole moment, which agree within the measurement errors with the above value. 4.) For the quantitative analysis of the measured angular distributions a quantum mechanical CC-code was required. 5.) Using the semiclassical CC-code NCL an illustrative and detailed interpretation of the excitation functions of ^{32}S($2^+{}_1$) and ^{60}Ni($2^+{}_1$) could be given. 6.) The code NCL allows the study of the influence of the Coulomb-nuclear force interference on the temporal behaviour of the excitation process. 7.) Using the code NCL the angular distribution of the decay γ quanta for a fixed particle-scattering angle theta approx. <= 180° in dependence on the incident energy was calculated. (orig.).

58658 **(INIS-mf—7189) Structure of collective bands in ^{78}Kr.** Hellmeister, H.P. (Koeln Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet). 13 Dec 1980. 133p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE82780728.

Thesis.

Using ^{16}O, ^{19}F, and ^{12}C induced reactions high spin states in ^{78}Kr were excited. The targets consisted of ^{65}Cu, ^{58}Ni, and ^{68}Zn. On the base of gamma spectroscopic methods as γγ-coincidences, angular distributions and excitation functions a level scheme of ^{78}Kr is proposed. Four bands could be identified, which decay mostly by stretched E2-transitions. From recoil distance Doppler shift as well as Doppler shift attenuation measurements lifetimes of about 20 states were measured. The β-decay of the 103 keV isomeric state and the ground state in ^{78}Rb was observed and the halflifes determined. Altogether a very good agreement of the level scheme and the E2- and E1-transition strength with predictions of the interacting boson model were found. Using a Monte Carlo code the γ-decay of the continuum of highly excited nuclei is described. Entry states, mean γ-energies, γ-spectra, mean multiplicities, multipolarities, and mean feeding times as well as e.g. their second moments were calculated for the reactions ^{58}Ni(^{16}O,2p)^{72}Se and ^{68}Zn(^{12}C,2n)^{78}Kr. The results are discussed and compared with experimental data. (HSI).

58659 **Two-quasiparticle-plus-rotor model calculations of /sup 76,78,80/Kr.** Soundranayagam, R.; Ramavataram, S.; Ramayya, A.V.; Hamilton, J.H.; Robinson, R.L. (Physics Department, Vanderbilt University, Nashville, Tennessee 37235). *Physical Review [Section] C: Nuclear Physics;* **25**: No. 6, 2983-2989(Jun 1982).

Two-quasiparticle-plus-rotor model calculations have been performed for /sup 76,78.80/Kr to study the systematics of high-spin states of these nuclei. The negative parity states whose energies are well reproduced by the model are characterized as two-quasiproton states. The consistency of the parameters and the agreement of the experimental and theoretical levels support the tentative spin-parity assignments. Our results for ^{80}Kr positive-parity, high-spin states indicate that these are zero- and two-quasiproton mixed states.

58660 **^{59}Ni(n,γ) reaction with thermal neutrons.** Raman, S. (Oak Ridge National Lab., TN); Jurney, E.T. pp 728-730 of Neutron capture gamma-ray spectroscopy. Chrien, R.E.; Kane, W.R. (eds.). New York, NY; Plenum Publishing Corporation (1979). Contract W-7405-ENG-26.

We have investigated in great detail, at the Los Alamos thermal neutron capture γ-ray facility, the energy levels of ^{60}Ni populated in the ^{59}Ni(n,γ) reaction. The target consisted of ≃ 7 mg of metal enriched to 95% in ^{59}Ni. Using a Ge(Li) detector, over 250 γ rays were identified, some with intensities as low as 0.02 photons/100 n-captures. Over 210 γ rays have been incorporated into a ^{60}Ni level scheme with 72 excited states. The first 50 levels in ^{60}Ni based on our study are given.

58661 (ECN—108) **Evaluation of neutron cross sections for the Pd isotopes (RCN-3 data library).** van der Kamp, H.A.J.; Gruppelaar, H. (Netherlands Energy Research Foundation, Petten). Dec 1981. 92p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE82702300.

The evaluation procedure to obtain neutron cross sections of ^{102}Pd, ^{104}Pd, ^{105}Pd, ^{106}Pd, ^{107}Pd, ^{108}Pd and ^{110}Pd for inclusion in the RCN-3 data library of fission-product cross sections is described. The new evaluation takes into account the results of recent differential and integral data. Most of the adopted resolved resonance parameters have been taken from the new CBNM measurements; for ^{107}Pd the recent RPI data have been used. These resolved resonance parameters have been extensively analysed to obtain average values for the level spacing, capture width and neutron s- and p-wave strength functions. The systematics of the single-particle level-density parameter a and the capture width show significant odd-even effects. Optical-model and statistical-model calculations have been performed to obtain cross sections of reactions at energies from 1 meV to 15 MeV. The results for the capture cross sections based upon the analysed average resonance parameters turned out to be systematically lower than the ORELA average capture data and also lower than indicated by the most integral STEK data (except for ^{105}Pd). As a compromise we have performed adjustments to increase the calculated fast capture cross sections for ^{104}Pd, ^{106}Pd and ^{108}Pd.

58662 (ECN—111) **Cross-section library DOSCROS81 (in a 640 group structure of the SAND-II type).** Zijp, W.L.; Nolthenius, H.J.; Rieffe, H.Ch. (Netherlands Energy Research Foundation, Petten). Dec 1981. 93p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE82702323.

The cross section library DOSCROS81 is an updated and extended version of the dosimetry cross section library DOSCROS77. The library contains energy dependent fine group cross section values for a number of reactions which are applied in neutron metrology and in neutron activation spectrometry. The library contains data from the ENDF/B-V file supplemented with information from the ENDF/B-IV and from the INDL/V. The total number of reaction cross section sets incorporated in this library is 70 (+ 3 cover cross section sets). A documentation of the library is presented. The library is written in the SAND-II format. The numerical data are available on microfiche upon request to ECN. The library will be available in a computer compatible form from the OECD NEA Data Bank and from the RSIC at Oak Ridge.

58663 (EFI—471(14)-81) **A-dependence of cumulative photoprotons.** Alankyan, K.V.; Amaryan, M.Dzh.; Demirchyan, R.A.; Egiyan, K.Sh.; Ogandzhanyan, M.S.; Stepanyan, S.G.; Sharabyan, Yu.G. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702324.

New experimental data on the A-dependence of the yield of proton photoproduction on nuclei in cumulative as well as non-cumulative regions are presented. It is shown that if the reaction yield has the form f approximately Asup(n) the exponent n is the slowly varying function of the proton kinetic energy without any peculiarities observed in the case of π-meson photoproduction. The dependences n on the proton detection angle and primary γ-quantum energy in the interval (Esub(γ))sub(max) 0.25-4.5 GeV are presented as well.

58664 (EFI—481(24)-81) **Cumulative photoproduction of particles on nuclei.** Egiyan, K.Sh. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 28p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702326.

A brief review is given of experimental investigations on the cumulative photoproduction of different particles in the interactions of high-energy γ-quanta with nuclei. Basing on the available data a conclusion is reached that in processes of the cumulative particle inclusive photoproduction the hypothesis of cumulative effect and nuclear scaling in electromagnetic interactions with nuclei are on the whole confirmed.

58665 (IAEA-NDS—42/R) **International Reactor Dosimetry File (IRDF-82).** Cullen, D.E.; Kocherov, N.; McLaughlin, P.M. (International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section). Jan 1982. 13p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702327.

This document describes the contents of the first version of the International Reactor Dosimetry File (IRDF-82), distributed by the Nuclear Data Section of the International Atomic Energy Agency. This document is a brief summary of the IRDF-82 documentation contained in IAEA-NDS-41.

58666 (INIS-mf—7116, pp vp) **Inelastic scattering and the structure of light deformed nuclei.** Smith, R.; Schmid, K.W. (Australian National Univ., Canberra. Dept. of Theoretical Physics). 1982. Dep. NTIS (US Sales Only).

From 9. AINSE nuclear physics conference; Melbourne, Australia (8 Feb 1982).

58667 (INIS-mf—7116, pp vp) **Octupole vibrations in the even-mass barium isotopes.** Pribac, F.; Baxter, A.M.; Hinds, S. (Australian National Univ., Canberra. Dept. of Physics); Esat, M.T.; Spear, R.H. (Australian National Univ., Canberra. Dept. of Nuclear Physics). 1982. Dep. NTIS (US Sales Only).

From 9. AINSE nuclear physics conference; Melbourne, Australia (8 Feb 1982).

58668 (INP—1094/PL) **Computer simulation of nuclear experiment with the ^{8}Be nucleus detection.** Kozik, T.; Czabanski, R. (Institute of Nuclear Physics, Krakow (Poland)). 1980. 28p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702312.

The two-step nuclear reaction with a strong resonance in the outgoing channel is taken as an example of detailed modeling of the density of final states in the phase space. The practical method of the precise calculating the effective solid angle and effective energy spectrum from the coincident registration of products of reaction is developed. There is applied the modyfied Monte Carlo approach.

58669 (INS-J—161) **Quasi-ground, quasi-beta, and quasi-gamma bands.** Sakai, M. (Tokyo Univ. (Japan). Inst. for Nuclear Study). 13 Aug 1981. 45p. NTIS (MF) (US Sales Only). Order Number DE82904633.

Portions of document are illegible.

For even-even nuclei a list is presented of the probable members of quasi-ground, quasi-beta, and quasi-gamma bands of the spherical regions and the corresponding ground, beta, and gamma bands of the deformed regions. For simplicity the term quasi is used for both regions. References are given to the experimental data basic to the level assignments. The literature has been covered through January 1981.

58670 (ITEF—76(1980)) **Analysis of angular dependences of inclusive cross sections of proton and light ion production on nuclei in the region of limiting target fragmentation.** Bayukov, Yu.D.; Gavrilov, V.B.; Efremenko, V.I.; Zajtsev, Yu.M.; Leksin, G.A.; Stavinskij, A.V.; Suchkov, D.A.; Chistilin, V.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1980. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702329.

Inclusive angular distributions of protons and light ions in deep inelastic nuclear reactions are compared with different model predictions. A simple unified parametric description of all inclusive invariant cross sections studied is proposed. The variable X=P-T cos THETA, where P and T are impulse and kinetic energy of a secondary particle excaping from the nucleus at the THETA given angle is introduced. The X value enables with a good accuracy to give a common description of all experimental data in a wide range of varialbes.

58671 (JINR—E-1-81-578) Energy-dependence of the proton emission and pion production intensity distribution in pion-xenon nucleus collisions. Strugalski, Z.; Pawlak, T.; Peryt, W.; Miller, K.; Pluta, J.; Wosinska, K. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1981. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702715.

Distributions of the pion production and proton em+ssion intensities in the pion-xenon nucleus collisions at 2.34-8 GeV/c momenta are presented. The pions of any electric charge-negative, positive and neutral-were registered. Correlations between the emitted proton multiplicities nsub(p) and produced pion multiplicities nsub(π) were studied. Noticeable change in the shape of the correlation characteristics is observed with the projectile energy increasing. The produced pion average multiplicity <nsub(π)> is energy and nsub(p) dependent. The normalized dispersion <D>/<nsub(π)> is nsub(p) dependent as well; the nsub(p) dependence of the <D>/<nsub(π)> in the collision events at 2.34 and 3.5 GeV/c momentum differs from those at higher projectile momenta where they are momentum independent. The average multiplication of produced pions in dependence on the projectile energy is presented too. Information about the momentum dependence of the frequency of events without the pion production is given.

58672 (JINR—E-15-81-270) Negative pion capture in atomic nuclei near the closed neutron shell at N=82. Butsev, V.S.; Chultem, D.; Zhivotov, I.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1981. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702330.

The results of studies of the excitation of high spin states in stopped π^--absorption in Nd, Pr, Ce, La and Ba nuclei are reported. States with spins 7^-, 8^- and $19/2^-$ have been identified. The isomeric ratios for the isotopes ^{131}Ba and ^{133}Ba have been determined to be equal to σsub(m)/σsub(g)=(5.1+-0.5) and (2.2+-0.3), respectively. For the isomers sup(134m)Cs and sup(135m)Cs the isotopic ratio is found to be σsub(msub(1))/σsub(msub(2))=8.2+-2.3. The distinguishing features of the mechanisms of excitation of high spin states by stopped π^- and fast protons are discussed.

58673 (JINR-R—6-81-565) Properties of ^{135}La excited states. Budzynski, M.; Lebedev, N.A.; Lizurej, G.I.; Muminov, T.M.; Nazmitdinov, R.G.; Sarzhinski, Ya.; Khazratov, T.; Khalikulov, A.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1981. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702333.

Angular correlations in ^{135}La have been measured for γ-cascades: 577-206, 666-206, 518-265, 607-265, 718-265, 905-265, 1184-265, 572-(34.5)-265, 871-(34.5)- 265, 1149-(34.5)-265 keV. The level spins of 1449 and 984 keV are determined as $1/2^+$. M1 and E2 multipolarities of some gamma-transitions are determined or refined. Properties of excited states in ^{135}La are investigated within the framework of the quasiparticle-phonon model with account for the Pauli principle. Calculations of reduced B(M1) and B(E2) probabilities for some ^{135}La transitions are given.

58674 (UCRL—85437) Exact calculations of nuclear-recoil energies from prompt gamma decays resulting from neutron capture. Kinney, J.H. (Lawrence Livermore National Lab., CA (USA)). 20 Jul 1981. Contract W-7405-ENG-48. 6p. (CONF-810831—92). NTIS, PC A02/MF A01. Order Number DE82019102.

From Fusion reactor materials meeting; Seattle, WA, USA (9 Aug 1981).

Portions of document are illegible.

The results of an accurate determination of the recoil spectrum from (n, γ) reactions in molybdenum are presented. The recoil spectrum has been calculated from nuclear level structure data and measured branching ratios. Angular correlations between successive gammas have been accounted for using the standard theoretical techniques of Racah algebra and the density matrix formalism.

58675 Neutron separation energies of some heavy nuclides. Islam, M.A.; Kennett, T.J.; Prestwich, W.V. (Department of Physics, McMaster University, Hamilton, Ontario, Canada, L8S 4K1). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 6, 3184-3188(Jun 1982).

Precision mesurements of high energy γ rays from thermal (n,γ) reactions with twelve nuclides as targets have been performed with an energy scale based upon the neutron separation energy of ^{15}N. The final nuclides and the deduced neutron separation energies (in keV) with absolute errors are ^{143}Nd (6123.62 +- 0.13), ^{144}Nd (7817.11 +- 0.12), ^{146}Nd (7565.28 +- 0.14), ^{156}Gd (8536.39 +- 0.12), ^{158}Gd (7937.39 +- 0.12), ^{162}Dy (8196.99 +- 0.12), ^{163}Dy (6270.98 +- 0.11), ^{164}Dy (7658.11 +- 0.12), ^{165}Dy (5715.96 +- 0.11), ^{166}Ho (6243.69 +- 0.11), ^{174}Yb (7464.63 +- 0.11), and ^{175}Yb (5822.35 +- 0.12).

58676 Influence of the M1 tensor term for transitions between levels of the two-proton nucleus ^{134}Te populated in the beta decay of 10-s ^{134}Sb. Heyde, K.; Sau, J.; Henry, E.A.; Meyer, R.A. (Institute of Nuclear Physics, Proeftuinstraat 86, B-900 Gent, Belgium). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 6, 3193-3196(Jun 1982).

Detailed calculations of electromagnetic transition rates (E2, M1, M2) have been carried out for ^{134}Te and compared with the results of detailed measurements on the gamma decay properties of this nucleus. The need for a small, but nonzero, contribution from the tensor M1 operator is pointed out.

58677 Nuclear structure and heavy-ion reactions. Schiffer, J.P. (Argonne National Lab., IL). pp 205-232 of Nuclear structure and heavy-ion collisions. Bologna, Italy; Society of Italiana di Fisica (1981).

The purpose of these lectures is first to review some of the connections between nuclear reactions and nuclear structure for light projectiles; then to discuss how these connections may help in understanding some of the phenomena in heavy-ion reactions.

58678 Test of the interacting boson model using pion-nucleus inelastic scattering. Lee, T.S.H. (Argonne National Lab., IL). pp 143-147 of Interacting Bose-Fermi systems in nuclei. Iachello, F. (ed.). New York, NY; Plenum Publishing Corporation (1981).

It is shown that the comparison between π^+ and π^- cross sections can be used to test the IBA of Arima and Iachello.

58679 Plans fcr laser hyperfine structure measurement at UNISOR. Carter, H.K. (UNISOR, Oak Ridge, TN); Bingham, C.R. pp 83-88 of Future directions in studies of nuclei far from stability. Hamilton, J.H. (ed.). Amsterdam, Netherlands; North-Holland Publishing Company (1980). Contract AC05-76OR00033.

In April, 1978, the UNISOR executive committee requested a study be done on the feasibility of optical spectroscopy experiments at UNISOR in order to determine nuclear spins, moments and changes in the root-mean-square charge radius ($\delta < r^2 >$). The study showed that it is indeed feasible to perform these measurements on many new isotopes which are produced at UNISOR. Subsequently, plans were made for the development of such a facility and funds were obtained for the capital equipment. A brief review of the technique is given with the details for the experimental procedure we intend to implement. The resolution and sensitivity expected at UNISOR is discussed.

58680 (CONF-820738—1) **Population and decay of high-spin states in /sup 157-161/Yb: evolution of nuclear shapes as a function spin and neutron number.** Jaeaeskelaeinen, M.; Sarantites, D.G.; Dilmanian, F.A.; Woodward, R.; Puchta, H.; Beene, J.R.; Halbert, M.L.; Hattula, J.; Hensley, D.C.; Barker, J.H. (Oak Ridge National Lab., TN (USA); Washington Univ., St. Louis, MO (USA). Dept. of Chemistry). 1982. Contract W-7405-ENG-26. 17p. NTIS, PC A02/MF A01. Order Number DE82018159.

From INS symposium on dynamics of nuclear collective motion; Mount Fuji, Japan (6 Jul 1982).

The population and decay of the entry states in /sup 157-161/Yb and /sup 155-158/Er from the reactions of 136- and 149-MeV ^{20}Ne with ^{144}Nd and ^{146}Nd have been investigated with the Spin Spectrometer gated with a Ge detector. Statistical-model calculations reproduce the main features of the entry state populations. The entry lines, <E/sup */> as a function of multiplicity, M/sub γ/ show changes in slope at high M/sub γ/ which are due to changes in the decay mode as a result of changes in nuclear structure. Energy spectra of the continuum γ-rays and angular distributions as a function of M/sub γ/ show the onset of a dipole component localized at 650 +- 100 keV accompanied by an equally intense quadrupole component at twice the energy that continues to evolve to higher energies with increasing multiplicity. For $^{157\ 158\ 159\ 160\ 161}$Yb the dipole component appears at M/sub γ/ = 21,22,23,25, and 27 (at spin I ≈ 38,40,42,45, and 50), respectively. At precisely these multiplicities the entry lines show a decrease in slope. In ^{158}Yb the dipole component disappears at M/sub γ/ = 28 and the entry line resumes its original slope. The results are consistent with the following picture. At low spins for $^{157\ 158}$Yb the nuclear shapes evolve from prolate to slightly oblate particle-aligned structures. At I ≈ 38,40,42,45, and 50 the $^{157\ 158\ 159\ 160\ 161}$Yb nuclei, respectively, develop high-K rotational bands which may be built on oblate structures with large deformation ($\epsilon \approx 0.3$). At I = 49 a transition to triaxial shape appears to occur in ^{158}Yb.

Thesis.

The decay of the highly excited ^{162}Yb nuclei formed in the reaction ^{150}Sm(^{16}O,4n)^{162}Yb to the ground state was studied using different gamma detectors and an electron spectrometer, a so called mini-orange. The isotope ^{162}Yb was moreover produced and spectroscoped by the beta-decay of ^{162}Lu. For the identification of decay cascades, which were passed after the fusion, and for the determination of the multipolarity of the contributing energy transitions a series of experiments took place: The excitation functions and the angular distributions of the emitted gamma radiation was measured, the conversion coefficients of important transitions were determined, and coincidence events between two detectors occasionally were registrated and analyzed. In the beta decay measurement an assignment of gamma transitions to ^{162}Yb followed due to the lifetime, under which they occured. The found states of ^{162}Yb upto spins of 22 h/2π and excitation energies above 5 MeV belong to five rotational bands. The yrast band shows a weak backbending. Corresponding to their spins and parities the bands can be reduced to intrinsic excitation of two quasineutrons. The analysis of the beta-decay of ^{162}Lu, which takes place from three states in ^{162}Lu, leads to the lowest levels of the gamma-vibrational band and the band head of the beta band. The microscopic interpretation of the rotational bands and the description of the backbending behaviour are as the interpretation of the states involved at the beta decay in agreement with experimental and theoretical results for neighbouring ytterbium isotopes. (orig.).

58685 (INP—1108/PL) **Study of the properties of nuclei far from the beta stability line.** Lizurej, H.I. (Institute of Nuclear Physics, Krakow (Poland)). 1980. 129p. (In Polish). NTIS (US Sales Only), PC A07/MF A01. Order Number DE82702328.

A complex of setups for measuring the lifetime of excited states of nuclei by the method of delayed electron-gamma and gamma-gamma coincidences in the range 10^{-10}-10^{-6}s is presented. The methods allowing for a substantial increase in the accuracy and efficiency of obtaining experimental data are developed. The procedures of measuring and analysing the multicomponent beta spectra with taking into account the instrumental effect which distorts the measured spectra are developed. Results of investigating the positron decay and determining the mass difference Qsub(B)+ for nuclei with Tsub(1/2)>20 min by the method of measuring the positron end-point energy are presented. The nano- and subnanosecond isomers for short-lived isotopes far from the beta stability line have been investigated. Probabilities of the electromagnetic transitions which depopulate the low-lying excited states in ^{151}Tb, ^{153}Dy, ^{160}Tm, sup(157,159,161)Er have been determined and analysed.

58686 **Transition from collective to aligned-particle configurations at high spin in ^{154}Dy.** Pakkanen, A.; Chung, Y.H.; Daly, P.J. (Purdue University, West Lafayette, Indiana 47907). *Physical Review Letters;* **48**: No. 22, 1530-1533(31 May 1982).

The high spin level structure of ^{154}Dy has been determined through the (^{34}S,4nγ) reaction. Lifetimes have been measured by use of the recoil-distance method. Both the level structure and lifetimes indicate a transition from collective to few-particle characteristics at high spin, possibly suggesting a changing shape from prolate through triaxial to oblate.

Thesis.

Using monochromatic photons produced by positron anihilation in flight the photofission cross sections of ^{209}Bi in the energy range from 40 to 65 MeV were determined. The result of these measurement shows that in the energy range between 40 and 65 MeV the photoreactions take place in an increasing way not via the formation and the statistic decay of a compound state. (orig./HSI).

58692 **(IPNO-TH—81-5) Fixed J spectral distribution in large shell model spaces. II. Fixed J configuration centroids and widths.** Jacquemin, C. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). Jan 1981. 56p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE82702315.

A method is developed to exactly calculate the fixed J configuration centroid energies and widths. The resulting approximate level densities for ^{204}Pb and ^{202}Pb show large departures with respect to the gaussian approximate level densities. The goodness of the polynomial expansion of fixed J configuration moments is studied and a simple improvement to this approximation is proposed which gives very good results.

58693 **(JYFL-RR—14/81) Low-seniority shell-model structure of ^{212}At.** Loennroth, T.; Rahkonen, V.; Fant, B. (Jyvaeskylae Univ. (Finland). Dept. of Physics). Sep 1981. 28p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702719.

Using the reaction ^{209}Bi(α,n) states in the nucleus ^{212}At were populated. The decay of excited states was studied using conventional in-beam γ-ray and conversion-electron spectroscopy. A great number of new levels were established and assigned spins and parities and the previously reported yrast cascade was confirmed. A new Tsub(1/2) = 32 +- 1 ns isomer at 275.4 keV is reported and interpreted to be the 5^- state of the πjsub$(0^+)^2$hsub(9/2)νgsub(9/2) configuration. The configurations were calculated as belonging to the neutror-proton seniority-2 two multiplets where the available orbitals are hsub(9/2), fsub(7/2) and isub(13/2) for the protons and gsub(9/2), isub(11/2) and jsub(15/2) for the neutrons. Configuration mixing is shown to be essential in order to account for the experimental findings. On the basis of isomeric lifetimes the effective charges are discussed.

58694 **Production of negative pions with 183-MeV/nucleon Ne beams.** Nagamiya, S.; Hamagaki, H.; Hecking, P.; Kadota, S.; Lombard, R.; Miake, Y.; Moeller, E.; Schnetzer, S.; Steiner, H.; Tanihata, I.; Bohrmann, S.; Knoll, J. (Nuclear Science Division, Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Physical Review Letters;* **48**: No. 26, 1780-1783(28 Jun 1982). Contract W-7405-ENG-48.

Cross sections for negative pion production in 183-MeV/nucleon Ne+NaF and Ne+Pb collisions have been measured at laboratory angles from 20° to 90°. Almost isotropic angular distributions in the nucleon-nucleon c.m. frame are observed. The energy spectra in this frame are of an exponential type with an inverse slope of 25 MeV for NaF and 26 MeV for Pb. No evidence of a bump predicted to result from pionic instability is observed. Possible mechanisms for producing high-energy pions are discussed.

58695 **Fission and deep spallation characteristics in relativistic nuclear collisions.** Warwick, A.I.; Baden, A.; Gutbrod, H.H.; Maier, M.R.; Peter, J.; Ritter, H.G.; Stelzer, H.; Wieman, H.H.; Weik, F.; Freedman, M.; Henderson, D.J.; Kaufman, S.B.; Steinberg, E.P.; Wilkins, B.D. (Gesellschaft fuer Schwerionenforschung, Darmstadt 0-6100, West Germany). *Physical Review Letters;* **48**: No. 25, 1719-1722(21 Jun 1982). Contract AC03-76SF00098;W-31-109-ENG-38.

Numbers of emitted fast charged particles associated with heavier nuclear fragments are employed as a graphic means of differentiating fission and spallation contributions to target fragment emission in relativistic nuclear collisions. The violent nature of the deep spallation mechanism is observed directly.

58696 **Excitation of low lying natural parity levels in ^{208}Pb by inelastic electron scattering.** Heisenberg, J.; Lichtenstadt, J.; Papanicolas, C.N.; McCarthy, J.S. (University of New Hampshire, Durham, New Hampshire 03824). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2292-2308(May 1982).

High resolution electron scattering measurements on ^{208}Pb have been performed at 90° and 160° which allow the spatial reconstruction of transition charge densities and for the first time, transition current densities. The measurement covering the momentum transfer range of $0.5<q<2.6$ fm^{-1} is supplemented by high momentum transfer data from Saclay, extending the data for some of the states up to a momentum transfer of 3.4 fm^{-1}. We report on the first three J/sup π/ = 5^- states and the first J/sup π/ = 7^- state. Transition charge densities have been also extracted for the lowest J/sup π/ = 2^+, 4^+, 6^+, and 8^+ states. The densities are compared to a number of theoretical calculations. Transverse electric currents are shown for the 5^- states that indicate a quenching of the magnetization current similar to observations from other states but the absence of quenching in the convection current contribution.

58697 **Macroscopic nucleon-nucleon correlations caused by the bounce-off process in energetic collisions of heavy nuclei.** Csernai, L.P.; Greiner, W.; Stoecker, H.; Tanihata, I.; Nagamiya, S.; Knoll, J. (Institut fuer Theoretische Physik, Johann Wolfgang Goethe Universitaet, Robert-Mayer-Strasse 8-10, D-6000 Frankfurt am Main 1, Germany). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2482-2490(May 1982). Contract W-7405-ENG-48.

Two-particle correlation data are presented for the reaction Ar (800 MeV/nucleon)+Pb. The experimental results are analyzed in the nuclear fluid dynamical and in a linear cascade model. We demonstrate that the collective hydrodynamical correlations dominate the measured two-particle correlation function for the heavy system studied. We discuss the transition from the early stages of the reaction which are governed by few nucleon correlations, to the later stages with their macroscopic flow which can only be reached using heavy colliding systems. The sensitivity of the correlation data on the underlying compressional and dissipative processes is analyzed.

58698 **Dissipative reaction dynamics of heavy-ion collisions.** Schroeder, W.U.; Huizenga, J.R. (Univ. of Rochester, NY). *Comments on Nuclear and Particle Physics;* **10**: No. 1, 19-31(1981).

Experimental studies of damped nuclear reactions have yielded evidence for the formation of a transient dinuclear system that dynamically evolves in time while microscopic processes lead to a gradually increasing complexity of the reaction bridging the gap from quasielastic to fusion collisions. There are strong indications for the dominance of the stochastic exchange of independent nucleons in damped reactions leading to the dissipative and fluctuative phenomena observed. There may also be other mechanisms proceeding concurrently, but it remains an experimental and theoretical task to establish the conditions under which such alternative mechanisms may be positively identified.

Thesis.

The fission products ^{132}I and ^{136}I produced in the fission reactions ^{238}U(α,f) and ^{238}U(d,f) were spectroscoped using a gas transport system. Thereby was taken advantage of the fact that at the transport with pure helium without aerosols only iodine activities were collected in a membrane filter. The relative independent yields of the isomeric fission products of ^{132}I and ^{136}I were determined for different excitation energies. Thereby was taken advantage of the fact that the transport yield of the gas transport system for ^{136}I directly produced from the fission was greater than for iodine indirectly produced by β-decay. (orig./HSI).

58705 **(INIS-mf—7182) Coulomb excitation of ^{226}Ra.** Zimmermann, R. (Muenchen Univ. (Germany, F.R.). Fachbereich Physik). 10 Nov 1980. 84p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE82780727.

Thesis.

The isotope ^{226}Ra was studied by multiple Coulomb excitation with a 135 MeV e.g. 150 MeV ^{32}S-beam and with a 243 MeV ^{58}Ni beam. Using particle gamma coincidences the gamma decay of the levels populated at the Coulomb excitation can be observed in spite of the natural target activity. The measured gamma energies and gamma intensities allow the establishment of a level scheme for ^{226}Ra with the following energy and spin assignments: 67.67 keV (2^+), 211.54 keV (4^+), 416.6 keV (6^+), 669.4 keV (8^+), 960.0 keV (10^+), 1281 keV (12^+), 1633 keV (14^+) in the ground state band and 253.7 keV (1^-), 321.5 keV (3^-), 446.5 keV (5^-), 626.9 keV (7^-), 857.9 keV (9^-), 1134 keV (11^-), 1446 keV (13^-) in the (Ksup(π) = 0^-) band. Furthermore two lines at 398 keV and 408 keV with low intensity are found. These could result from the gamma decay of possibly existing 2-phonon octupole vibrational states. By semiclassical Coulomb excitation calculations absolute values for E1-, E2-, and E3-transition probabilities within e.g. between the bands are determined using a nonlinear X^2fit from the measured gamma intensities. The results are discussed using different theoretical models. (orig.).

58706 **(JINR-R—7-81-184) Investigation of time components of the ^{238}U+^{12}C and W+^{22}Ne fission reactions.** Bugrov, V.N.; Karamyan, S.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1981. 16p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702334.

Blocking minima are studied in angular distributions of fission fragments formed at irradiating UO_2 monocrystalline targets by ^{12}C ions and W by ^{22}Ne ions with energies equal to 81 and 174 MeV respectively. The data on radiation damage of monocrystals are obtained. The time delay of fission reactions is investigated. The long-lived time component of fission (tau > or approximately 10^{-16} s) associated with the contribution of direct nuclear reaction products is observed in the ^{238}U+^{12}C reaction.

58707 **Energy levels of ^{249}Cm from measurements of thermal neutron capture gamma rays.** Hoff, R.W.; Davidson, W.F.; Warner, D.D.; Boerner, H.G.; von Egidy, T. (University of California, Lawrence Livermore Laboratory, Livermore, California 94550). *Physical Review [Section] C: Nuclear Physics;* **25**: No. 5, 2232-2254(May 1982). Contract W-7405-ENG-48.

The excited levels of ^{249}Cm have been determined by use of neutron-capture gamma-ray spectroscopy. Gamma-ray measurements were made with curved-crystal spectrometers of focal lengths 5.8 and 24 m and a pair spectrometer. These experimental data represent the first measurement of gamma transitions depopulating the levels of ^{249}Cm. We present evidence for the population of 23 levels in ^{249}Cm up to 1300-keV excitation. The following new configuration assignments were made (listed with the corresponding bandhead energies): $(5/2)^+[622]$, 529.58 keV; $(3/2)^-[752]$, 772.74 keV; $(1/2)^-[501]$, 917.49 keV. Comparison of the experimentally determined level structure with theoretical calculations shows best agreement with calculations by Soloviev's group where a Woods-Saxon potential form was used and quasiparticle-phonon coupling was included. The neutron binding energy was determined to be 4713.7 +- 0.3 keV.

58708 Coherent collective flow versus independent two-nucleon collisions in central high-energy heavy-ion collisions. Nix, J.R.; Strottman, D.; Yariv, Y.; Fraenkel, Z. (Max-Planck-Institut fuer Kernphysik, D-6900 Heidelberg, Federal Republic of Germany). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2491-2497(May 1982).

For central collisions in the reaction $^{20}Ne+^{238}U$ at a laboratory bombarding energy per nucleon of 393 MeV, we calculate the cross section $d^2\sigma/dE\ d\Omega$ for outgoing charged particles by means of a relativistic intranuclear cascade, conventional relativistic nuclear fluid dynamics, and relativistic nuclear two-fluid dynamics. The results of the three calculations are compared with recent high-multiplicity-selected central-collision experimental data of Stock et al., including contributions from protons, deuterons, and tritons. The intranuclear cascade reproduces most features of the experimental data except the observed sidewards peaking in the angular distributions at low outgoing energy, predicting instead angular distributions that are forward peaked at all outgoing energies, to within statistical errors. Conventional nuclear fluid dynamics fails to reproduce the experimental data in two important respects: (1) the predicted energy spectra in forward directions decrease too rapidly with increasing outgoing energy and (2) the predicted angular distributions are too narrow and peak at increasingly larger angles with increasing outgoing energy, opposite to the experimental trend. Nuclear two-fluid dynamics predicts sidewards peaking for central collisions at intermediate outgoing energy that is in approximate agreement with experimental results, although the calculated peak is somewhat sharper than the experimental peak. With qualifications arising from the possible importance of contributions from large impact parameters, heavy composite particles, Coulomb effects, and thermal folding, we conclude that in central high-energy heavy-ion collisions the target and projectile interpenetrate substantially but that some degree of coherent collective flow is involved.

58709 Lifetime of the long-lived isomer of ^{236}Np from α-, β- and electron-capture decay measurements. Lindner, M.; Dupzyk, R.J.; Hoff, R.W.; Nagle, R.J. (California Univ., Livermore (USA). Lawrence Livermore National Lab.). *Journal of Inorganic and Nuclear Chemistry;* **43**: No. 12, 3071-3080(1981).

The half-life of long-lived ^{236}Np, due to α, β and electron-capture decay, was found to be 1.55 x 10^5 yr. Of all decays, 88% populate excited states in ^{236}U and 12% populate levels in ^{236}Pu. Lifetimes measured by growth of the ground states of ^{236}U and ^{236}Pu agree with values from corresponding γ de-excitations in these daughter nuclei. Therefore, nearly all the electron-capture decays populate the 6^+ level of the ground-state band in ^{236}U. Similarly, essentially all the β^- decay populates an analogous 6^+ level in ^{236}Pu, which de-excites through a previously unreported transition of 158.3 keV. If a very week γ-ray at 894 keV can be ascribed to a level in ^{232}U populated by β decay of ^{232}Pa, its existence establishes a 0.2% α-branching decay in ^{236}Np.

58710 (BNL—31486) IBA in deformed nuclei. Casten, R.F.; Warner, D.D. (Brookhaven National Lab., Upton, NY (USA)). 1982. Contract AC02-76CH00016. 48p. (CONF-820385—1). NTIS, PC A03/MF A01. Order Number DE82018062.

From International school of nuclear physics conference; Trapain, Sicily, Italy (27 Mar 1982).

The structure and characteristic properties and predictions of the IBA in deformed nuclei are reviewed, and compared with experiment, in particular for ^{168}Er. Overall, excellent agreement, with a minimum of free parameters (in effect, two, neglecting scale factors on energy differences), was obtained. A particularly surprising, and unavoidable, prediction is that of strong $\beta \rightarrow \gamma$ transitions, a feature characteristically absent in the geometrical model, but manifest empirically. Some discrepancies were also noted, principally for the K=4 excitation, and the detailed magnitudes of some specific B(E2) values. Considerable attention is paid to analyzing the structure of the IBA states and their relation to geometric models. The bandmixing formalism was studied to interpret both the aforementioned discrepancies and the origin of the $\beta \rightarrow \gamma$ transitions. The IBA states, extremely complex in the usual SU(5) basis, are transformed to the SU(3) basis, as is the interaction Hamiltonian. The IBA wave functions appear with much simplified structure in this way as does the structure of the associated B(E2) values. The nature of the symmetry breaking of SU(3) for actual deformed nuclei is seen to be predominantly $\Delta K=0$ mixing. A modified, and more consistent, formalism for the IBA-1 is introduced which is simpler, has fewer free parameters (in effect, one, neglecting scale factors on energy differences), is in at least as good agreement with experiment as the earlier formalism, contains a special case of the 0(6) limit which corresponds to that known empirically, and appears to have a close relationship to the IBA-2. The new formalism facilitates the construction of contour plots of various observables (e.g., energy or B(E2) ratios) as functions of N and chi/sub Q/ which allow the parameter-free discussion of qualitative trajectories or systematics.

58711 (CEA-CONF—5930) Born-Oppenheimer coupling between collective and intrinsic degrees of freedom. Giraud, B.G. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique). Sep 1981. 13p. (CONF-8109142—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702305.

From International symposium on clustering phenomena in nuclei; Tuebingen, F.R. Germany (9 Sep 1981).

The splitting of the nuclear Hamiltonian into a collective Hamiltonian, an intrinsic Hamiltonian and a coupling term is shown to be a solvable problem. The solution is equivalent to a change of representation, as examplifield by the multi-channel theory of nuclear scattering or the Born-Oppenheimer representation of molecular dynamics.

58712 (CEA-CONF—6036) Low energy nuclear fission. Nifenecker, H. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Dept. de Recherche Fondamentale). Aug 1980. 58p. (CONF-8008136—1). NTIS (US Sales Only), PC A04/MF A01. Order Number DE82702308.

From Netherlands Physical Society summer school on nuclear structure; Dronten, Netherlands (13 Aug 1980).

In these lectures the liquid drop model of fission is presented and some of its predictions compared with experiment. The liquid drop analogy allows to define in a rather simple and intuitive way a number of useful concepts and possible observables. It is shown how a synthesis of the liquid drop model and of the shell model can be made using the Strutinsky shell averaging procedure. Some experimental data related to the existence of shape isomers are presented and discussed. We conclude by discussing some aspects, both experimental and theoretical, of fission dynamics.

58713 (EFI—487(30)-81) Nuclear forces and quantum chromodynamics. Muradian, R.M. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 19p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702311.

The mechanism of the nuclear force origin is discussed. It is supposed that at short distances nucleons exchange coloured quarks in consistency with QCD general notions. The obtained relation between binding energies of light nuclei does not contradict experimental data. It is shown that besides the ordinary two-body forces in the system of three or more nucleons should exist three-body forces.

58714 (INIS-mf—6968, pp 361-377) **Single determinantal reaction theory as a Schroedinger analog: the time-dependent S-matrix Hartree-Fock method.** Griffin, J.J.; Lichtner, P.C.; Dworzecka, M.; Kit-Keung Kan (Maryland Univ., College Park (USA). Dept. of Physics and Astronomy). 1979. NTIS (US Sales Only), PC A18/MF A01.

From Conference on large amplitude collective nuclear motion; Lake Balaton, Hungary (10 Jun 1979).

The TDHF method is suggested to be considered not as an approximation to but as a model of the exact Schroedinger system. Thus the TDHF description of continuum reactions can be reconstructed from an initial value problem into a form analogous to the S matrix version of the Schroedinger theory. Periodic solutions then play the role of stationary eigenstates in the construction of suitable asymptotic reaction channels.

58715 (INIS-mf—7058, pp 413-427) **Transfer of momentum, mass and charge in heavy ion collisions.** Beck, F.; Feldmeier, H. (Technische Hochschule Darmstadt (Germany, F.R.). Inst. fuer Kernphysik); Dworzecka, M. (Maryland Univ., College Park (USA). Dept. of Physics and Astronomy). 1979. NTIS (US Sales Only), PC A20/MF A01.

From Conference on large amplitude collective nuclear motion; Lake Balaton, Hungary (10 Jun 1979).

A model for the first two phases of heavy ion collisions based on the transport of single nucleons through the window between the two scattering nuclei is described in some detail. It is pointed out that the model can account simultaneously for a large portion of the energy transfer from relative to intrinsic motion and for the observed variances in mass and charge numbers for reaction times up to the order of 10^{-21} s.

58716 (INIS-mf—7116, pp vp) **Fission and evaporation residue measurements near to the ^{208}Pb closed shell.** Charity, R.J.; Galster, W.; Hinde, D.; Leigh, J.R.; Newton, J.O.; Ward, D.; Sie, S.H. (Australian National Univ., Canberra. Dept. of Nuclear Physics). 1982. Dep. NTIS (US Sales Only).

From 9. AINSE nuclear physics conference; Melbourne, Australia (8 Feb 1982).

58717 (INP—1127/PL) **Uncertainty of the shape of the local optical model potential.** Dabrowski, H.; Freindl, L. (Institute of Nuclear Physics, Krakow (Poland)). 1981. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702313.

The formulas for the errors of the shape of the optical model potential connected with the experimental errors were deduced basing on the covariance matrix of potential parameters. The "corridor" of errors for real part of the potential was calculated for the elastic alpha particle scattering on ^{90}Zr case at energies 40, 99.5 and 118 MeV. The errors of the volume integrals and root mean square radius (rmsr) were also calculated using the same method. The character of the obtained "corridor" may be simply explained in terms of the impact parameter and strong absorption of alpha particles.

58718 (INP—1129/PL) **Cluster properties of the giant monopole resonances EO in the light and medium mass nuclei.** Knyr, V.A.; Smirnov, Yu.F. (Institute of Nuclear Physics, Krakow (Poland)). 1981. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702314.

The connection between the cluster spectroscopic factors of the giant monopole isoscalar resonances EO and the ground states of nuclei has been established by means of the formalism of the Sp(2,R) group. These relations allow to analyse the dependence of the cluster properties of the isoscalar EO giant resonances on the mass number A.

58719 (ITEF—98(1981)) **Coulomb problem with a short-range interaction. Bound states and resonances.** Popov, V.S.; Kudryavtsev, A.E.; Lisin, V.I.; Mur, V.D. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1981. 45p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702491.

The problem on the Coulomb potential distorted at small (r approximately $r_0 << \alpha$sub(β)) distances, r_0 - radius of strong interaction, αsub(β) - Bor radius, is considered. The equation determining the pole position of the S matrix on K complex plane is obtained. The pole motion at increase of Vsub(S) strong potential depth is investigated. The pole motion nature varies qualitatively depending on the fact whether the Coulomb interaction is attraction or repulsion as well as on the l orbital momentum value ($l=0$ or $l>=1$). Limiting cases are considered and asymptotic formulas binding the pole position with scattering length and effective radius are obtained. Numerical calculation results are discussed as well.

58720 (NASA-CR—168848, pp 260-267) **Fluid dynamical description of relativistic nuclear collisions.** Nix, J.R.; Strottman, D. Mar 1982. NTIS, PC A17/MF A01.

From 2. convention of the international colloquium on drops and bubbles; Monterey, CA, USA (19 Nov 1981).

On the basis of both a conventional relativistic nuclear fluid dynamic model and a two fluid generalization that takes into account the interpenetration of the target and projectile upon contact, collisions between heavy nuclei moving at relativistic speeds are calculated. This is done by solving the relevant equations of motion numerically in three spatial dimensions by use of particle in cell finite difference computing techniques. The effect of incorporating a density isomer, or quasistable state, in the nuclear equation of state at three times normal nuclear density, and the effect of doubling the nuclear compressibility coefficient are studied. For the reaction 20Ne + 238U at a laboratory bombarding energy per nucleon of 393 MeV, the calculated distributions in energy and angle of outgoing charged particles are compared with recent experimental data both integrated over all impact parameters and for nearly central collisions.

58721 **Mesonic folded diagram theory of the nucleon-nucleon potential.** Li, G.; Ng, K.K.; Kuo, T.T.S. (Department of Physics, State University of New York at Stony Brook, Stony Brook, New York 11794). *Physical Review [Section] C: Nuclear Physics;* **25**: No. 6, 2877-2882(Jun 1982). Contract AC02-76ER13001.

We propose a general theory for deriving the nucleon-nucleon (NN) potential V from meson exchanges. Our potential preserves the half-on-shell NN T matrix, contains mesonic folded diagrams and is energy independent. Mesonic folded diagrams are estimated to be of negligible effect for the long-range part of V but may be important for its medium- and short-range parts.

58722 **Coulomb final state interaction and the charge effect in heavy ion projectile fragmentation at intermediate energies.** Wong, C.Y.; Van Bibber, K. (Physics Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review [Section] C: Nuclear Physics;* **25**: No. 6, 2990-2995(Jun 1982).

In intermediate energy heavy-ion projectile fragmentation the width of the transverse momentum distribution for a given fragment mass depends on the charge number of the fragment. The greater the charge number, the smaller is the width of the transverse momentum distribution. Such a charge effect may be explained in terms of a Coulomb final state interaction between the fragment and the protons dissociated from the projectile. With simple assumptions concerning the fragmentation process, analytic expressions for the momentum dispersions are obtained and are found to give good agreement with experimental results.

58723 **Microscopic study of the Δ-nucleus potential from a many-body Hamiltonian for π, N, and Δ^+.** Lee, T.H.; Ohta, K. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review [Section] C: Nuclear Physics;* **25**: No. 6, 3043-3049(Jun 1982). Contract AC02-76ER03069.

The strength of the Δ-nucleus potential is calculated from the many-body Hamiltonian for π, N, and Δ constructed by Betz and Lee. The results are compared to the empirical values of the Δ-hole doorway model. It is found that the calculated strength of the central potential reproduces the empirical one to a large extent. However, the calculated spin-orbit potential is much smaller than that of the Δ-hole model. It is also shown that the pion absorption through the NΔ S-wave only accounts for about half of the total absorption. The sum of other NΔ partial waves are found to be equally important.

58724 **Elastic isovector vibrations and the boundary conditions.** Azziz, N.; Palathingal, J.C.; Wong, C.Y. (University of Puerto Rico, Mayaguez, Puerto Rico, 00708). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 6, 3110-3114(Jun 1982).

The elastic model, which successfully explains the isoscalar giant resonances, is now applied to study the isovector giant resonances. In solving the Lame equation, we employ the boundary condition that the displacement shall vanish at the surface. The results are compared with those obtained under the contrasting boundary condition that the stresses shall be absent at the surface. It was found that the results are dependent on the type of boundary conditions. Future experimental data will allow the assessment of the correct choice of boundary conditions.

58725 **Comment on "Exactly central heavy-ion collisions by nuclear hydrodynamics".** Csernai, L.P.; Stoecker, H. (Institut fuer Theoretische Physik, Johann Wolfgang Goethe Universitaet, 6000 Frankfurt am Main, Germany). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 6, 3208-3211(Jun 1982). Contract W-7405-ENG-48.

Problems arising in viscous nuclear fluid dynamical models of high-energy heavy-ion collisions are discussed. The importance of an accurate treatment of the transport properties of the hot and dense nuclear matter is pointed out.

58726 **Modified formulation of the phenomenological interacting boson approximation.** Warner, D.D.; Casten, R.F. (Brookhaven National Laboratory, Upton, New York 11973). *Physical Review Letters;* **48**: No. 20, 1385-1389(17 May 1982). Contract AC02-76CH00016.

Previous interacting-boson-approximation studies of deformed nuclei have used different forms of the quadrupole operator in the Hamiltonian and E2 operators. A revised formalism is proposed which employs consistent operators and embodies a simpler Hamiltonian. It yields improved agreement with the data for deformed nuclei, a number of parameter-free predictions for transition regions, and a specific form of the O(6) limit which agrees with that found empirically.

58727 **Inclusion of deuteron and alpha-particle collisions in intranuclear cascade calculations.** Mathews, G.J.; Glagola, B.G.; Moyle, R.A.; Viola, V.E. Jr. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2181-2195(May 1982).

An intranuclear cascade model generalized to allow deuteron and alpha-particle collisions during the cascade is discussed. A comparison of calculations is presented for nucleon-induced cascades with and without clusters present in the target nucleus and the effects of clustering are inferred. Alpha-particle-induced collisions are studied in detail and compared with experimental data. It is found that many features of alpha-particle-induced reactions can be well understood with this model. Possible shortcomings and directions of future improvements in the code are highlighted.

58728 **Positive energy Weinberg states for the solution of scattering problems.** Rawitscher, G. (Center for Theoretical Physics, Laboratory for Nuclear Science and ment of Physics). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2196-2213(May 1982). Contract AC04-79ET23001;AC02-76ER03069.

Positive energy Weinberg states are defined and numerically calculated in the presence of a general complex Woods-Saxon potential. The numerical procedure is checked for the limit of a square well potential for which the Weinberg states and the corresponding eigenvalues are known. A finite number M of these (auxiliary) positive energy Weinberg states are then use as a set of basis functions in order to provide a separable approximation of rank M, V/sub M/, to a potential V, and also to the scattering matrix element S which obtains as a result of the presence of V, S/sub M/. Both V/sub M/ and S/sub M/ are obtained by means of algebraic manipulations which involve the matrix elements of V calculated in terms of the auxiliary postive energy Weinberg states Next, expressions are derived which enable one to iteratively correct for the error in V—V/sub M/. These expressions are a modified version of the quasi-particle method of Weinberg. The convergence of S/sub M/ to S, as well as the first order interation of the error in S/sub M/ is examined as a function M for a numerical example which uses a complex Woods-Saxon potential for V and assumes zero angular momentum. With M = 5 and one iteration an error of less than 10% in S is achieved; for M = 8 the error is less than 1%. The method is expected to be useful for the solution of large systems of coupled equations by matrix techniques or when a part of the potential is non-local.

58729 **Equilibrium shapes and fission barriers of rotating nuclei with a macroscopic two-center model.** Mustafa, M.G.; Baisden, P.A.; Chandra, H. (Nuclear Chemistry Division, Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2524-2533(May 1982).

Equilibrium shapes and fission barriers of rotating nuclei have been calculated using a macroscopic two-center model, with a finite-range nuclear force and a diffuse nuclear surface. Our model differs from the rotating-liquid-drop model of Cohen, Plasil, and Swiatecki in the shape parametrization and in the calculations of the surface, Coulomb, and rotational energies. We use the two-center-model shape parametrization, which allows for triaxial shape variations and a continuous transition from one-center to two-center shapes with a smooth neck. We calculate the surface energy with the Yukawa-plus-exponential folding function of Krappe, Nix, and Sierk, which incorporates the effects of the finite range of the nuclear force and the diffuse nuclear surface, and calculate both the Coulomb and rotational energies with surface diffuseness described by a Yukawa folding function. The calculation includes beta-stable nuclei up to mass number A = 250 and selected nuclei off the line of beta stability. The results are compared with the predictions of the rotating-liquid-drop model and with experimental results statistically deduced from heavy-ion induced reactions.

58730 **Meson fields with vanishing expectation values.** Bolsterli, M. (Schweizerisches Institut fuer Nuklearforschung, CH-5234 Villigen, Switzerland). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2728-2732(May 1982).

A method for treating meson fields whose expectation values must vanish because of symmetry is presented in terms of a simplified model of pions, nucleons, and deltas constituting a model alpha particle. Self-consistent equations for the wave functions are derived from the variational principle. The relation to the mean-field procedure, which can be used for fields with expectation values, is discussed.

58731 **Collective transitions at high level density.** Leander, G. (Florida State University, Tallahasse, Florida and UNISOR, Oak Ridge Associated Universities, Oak Ridge, Tennessee). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2780-2786(May 1982).

It has been assumed that highly excited collective bands, more or less parallel to the yrast line, are important for the gamma deexcitation of rotational nuclei formed in heavy-ion reactions. This paper draws attention to the possibility that the in-band decay of any given state may be spread over a broad spectrum and discusses the implications of the cascade process. A simple model, where bands are generated by coherent matrix motion in the Gaussian orthogonal ensemble, indicates how the spreading width may depend on the fundamental nature of nuclear level structure.

58732 **Dynamics of nuclear fluid. VII. Isovector, spin-vector, and spin-isovector giant multipole resonances as elastic vibrations.** Wong, C. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2787-2794(May 1982).

Previously, we studied the isoscalar giant resonances as the elastic vibration of a nucleus, the peculiar properties of elasticity being a manifestation of the quantum stress tensor. We examine here the other types of collective vibrations involving elastic spin and isospin waves. Relevant electric and magnetic multipole states for the isovector, the spin vector, and the spin-isovector modes are determined. We find that for a given electric or magnetic state with multipolarity l different from zero, the lowest eigenenergies for the different modes of giant resonances (isoscalar, isovector, spin-vector, and spin-isovector) are approximately degenerate. On the other hand, the l/sup π/ = 0^+ states depend on the nuclear incompressibility and the symmetry energy coefficients. Their eigenenergies can be quite different. The theoretical eigenenergies for the giant isovector electric multipole states compare well with experimental data.

58733 **Determination of the NN cross section in nuclei from inclusive (π,π') and coincidence ($\pi,\pi N$) reactions.** Piasetzky, E.; Silbar, R.R.; Sternheim, M.M. (Physics Department, Tel Aviv University, Tel Aviv, Israel). *Physical Review* [*Section*] *C: Nuclear Physics;* **25**: No. 5, 2830-2833(May 1982).

A semiclassical model applied to backward inelastic pion-nucleus scattering reproduces the general features of the (π,π') data and suggests a way of extracting the fractions involving pion multiple scattering, nucleon final state interactions, and unperturbed quasifree scattering. In order to fit the knockout (π^+,π^+ p) coincidence data, the free NN cross sections must be reduced by a factor which rapidly increases with A, implying a long mean free path for the outgoing nucleon in heavy nuclei.

58734 **Status of experimental tests of the IBA.** Casten, R.F. (Brookhaven National Lab., Upton, NY). pp 3-20 of Interacting Bose-Fermi systems in nuclei. Iachello, F. (Ed.). New York, NY; Plenum Publishing Corporation (1981).

This review will survey the status of experimental tests of the IBA including a discussion of both IBA-1 and IBA-2. Overall, to date, the IBA has enjoyed enormous success, both in individual nuclei and as a general scheme for the unified treatment of entire regions. As the number of tests of the model has grown recently, the first significant discrepancies have also appeared and will be discussed in some detail. The review is limited to even-even nuclei.

58735 **Nuclear mass relations and equations.** Monahan, J.E.; Serduke, F.J.D. (Argonne National Lab., IL). pp 151-159 of Atomic masses and fundamental constants 6. Nolen, J.A. Jr.; Benenson, W. (eds.). New York, NY; Plenum Publishing Corporation (1980).

Relations among the masses of neighboring nuclei provide a convenient and reasonably accurate method for the estimation of unknown masses. A set of such relations is presented. Each member of this set gives a prediction of roughly equal statistical accuracy for the unknown mass of a given nuclide. The average and dispersion of the set give a most probable mass value and a measure of its uncertainty. The structure of these relations (considered as partial difference equations) lead to another set of difference equations the solutions of which can be ordered such that each successive member is expected to be a more nearly accurate representation of ground-state energies as functions of N and Z. The reliability of such solutions for extrapolation far from the region of known nuclei is discussed.

58736 **Measured population inversion for the VUV region from resonance charge transfer.** Elton, R.C.; Dixon, R.H. pp 1-3 of Fifth international conference on vacuum ultraviolet radiation physics. Washington, DC; Naval Research Laboratory (1977).

From 5. international conference on vacuum ultraviolet radiation physics; Montpellier, France (5 Sep 1977).

Since charge transfer is a collision process, rapid pumping occurs at high densities and inversion is maintained as along as the densities are sufficient and the lower state is more rapidly depleted than it is filled, i.e., quasi-cw inversion and gain become possible. A stringent requirement for this scheme is the creation of a region of high density ion/atom interaction. We have accomplished this with carbon atoms and C^{5+} and C^{6+} ions, all generated from a graphite disc vaporized by a 5J, 16ns Nd-glass laser beam focused to a 0.5 mm spot. The particles interact in a buffer gas at a pressure of 1-5 Torr. The reactions are $C + C^{5+,6+} \rightarrow C^+ + (C^{4+,5+})^* + \Delta E$/sub if, where ΔE/sub if/ if the required exothermic reaction energy defect and the product excited state* is predominantly n = 4. With a cross section of $\sigma \cong 10^{-16} z^2 \cong 4 \times 10^{-15}$ cm^2 for a net ion charge z and a theoretically desirable relative velocity v in the range of (1-8) 10^6 cm/sec, a pumping rate per initial ion of N/sub a/ <σv> ≅ 2 x 10^9 sec^{-1} when compared with a n = 4 final ion depletion rate of ~ 4 x 10^{10} sec^{-1}, implies an ~ 5% n = 4 excitation. A n = 3 lower state depletion rate of 8 x 10^{11} sec^{-1} assures continuous inversion. Here N/sub a/ ≅ 10^{17} cm^{-3} refers to the neutral atom density.

58737 **(EFI—466(8)-81) Low energy spectra of 4.7 GeV electron radiation at small entrance angles into diamond crystal.** Avakyan, R.O.; Agan'yants, A.O.; Vartanov, Yu.A.; Vartapetyan, G.A.; Taroyan, S.P. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702257.

The radiation of 4.7 GeV electrons in diamond monocrystal with various orientations and thickness is investigated. A similarity of the spectra as well as a decrease of the multiple scattering of electrons at small entrance angles with respect to the crystallographic plane are observed.

58738 **(FEI—1199) Representation of particle space distribution by Fourier series in the Monte Carlo method.** Androsenko, P.A.; Bolonkina, G.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1981. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702304.

Peculiarities of representation of particle spatial distribution density by Fourier series examplified by the gamma radiation propagation problem in barrier geometry are considered. The problem is solved by the semianalytic Monte Carlo method. Recurrent formulas for the Fourier series coefficients are derived. The test calculation results are presented.

58739 **(INIS-mf—7108) Preparation of a bent crystal and its use in neutron scattering.** Kraxenberger, H. (Bayreuth Univ. (Germany, F.R.)). 24 Jul 1980. 115p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE82780710.

Thesis.

The aim of this thesis was the construction of a horizontally bendable neutron monochromator e.g. analyzator, the application to different measuring problem in neutron scattering, and the development of an exact theory.

58742 **(ITEF—97(1981)) Energy dependence of a conversion length of gamma quanta in liquid xenon in the 25-2400 MeV range.** Barmin, V.V.; Barylov, V.G.; Davidenko, G.V.; Demidov, V.S.; Dolgolenko, A.G.; Chistyakova, T.A.; Shebanov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1981. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702713.

The energy dependence of a conversion length of gamma quanta in liquid xenon in the 25-2400 MeV range is determined by the photos of 180 litre xenon bubble chamber exposed on 3.2 GeV/c π^--meson beams and 0.85 GeV/c K^+ mesons. The results obtained have been compared with the calculation results. The calculations are performed for xenon which contains a small amount of propane impurity. The conversion length is determined by total cross sections of gamma quanta interaction with Xe, C and H atoms. The xenon main contribution into the total cross section value is given by the processes of electron-positron pairs production and of compton scattering. On the basis of data obtained on the conversion length in liquid xenon with a small amount of propane impurity the cross section of electron-positron pairs production in pure xenon is calculated.

58743 **(ITEF—100(1981)) Investigation of characteristics of a spin flipper in form of a foil with current.** Bulgakov, M.I.; Gul'ko, A.D.; Trostin, S.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1981. 44p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702301.

The magnetic field distribution is considered for the current in the foil-sheet of finite width, often used as a spin flipper for the polarized neutrons. It is shown that the decrease of the reversal efficiency with increasing distance of the neutrons from the flipper axis is caused by not antiparallel magnetic field components on the opposite surfaces of the foil. The reason of it is the components of the current foil magnetic field perpendicular to the foil's surface. The formulae for the polarization reversal efficiency (flipping efficiency) for the neutrons, crossing such a spin flipper. The experimental results are given. The method of the compensation of the perpendicular magnetic field component on the foil's surface is reported. It gives the possibility of the considerable enlargement of the region with high reversal efficiency of neutron polarization.

58744 **(SAND—80-1968) Electron energy and charge albedos - calorimetric measurement vs Monte Carlo theory.** Lockwood, G.J.; Ruggles, L.E.; Miller, G.H.; Halbleib, J.A. (Sandia National Labs., Albuquerque, NM (USA)). Nov 1981. Contract AC04-76DP00789. 74p. NTIS, PC A04/MF A01. Order Number DE82006870.

A new calorimetric method has been employed to obtain saturated electron energy albedos for Be, C, Al, Ti, Mo, Ta, U, and UO_2 over the range of incident energies from 0.1 to 1.0 MeV. The technique was so designed to permit the simultaneous measurement of saturated charge albedos. In the cases of C, Al, Ta, and U the measurements were extended down to about 0.025 MeV. The angle of incidence was varied from 0° (normal) to 75° in steps of 15°, with selected measurements at 82.5° in Be and C. In each case, state-of-the-art predictions were obtained from a Monte Carlo model. The generally good agreement between theory and experiment over this extensive parameter space represents a strong validation of both the theoretical model and the new experimental method. Nevertheless, certain discrepancies at low incident energies, especially in high-atomic-number materials, and at all energies in the case of the U energy albedos are not completely understood.

58745 **(SGAE—4031) STOSS - A computer module which can be used in Monte-Carlo-calculation for determining the path of a particle in a heterogeneous medium in three dimensions.** Sdouz, G. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Sep 1980. 39p. (In German). (RS—171/80). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702302.

The computer program STOSS determines the path of a particle in a heterogenous medium in three dimensions. The program can be used as a module in Monte-Carlo-calculations. The collision can be transferred from the centre-of-mass system into a fixed cartesian coordinate-system by means of appropriate transformations. Then the path length is determined and the location of the next collision is calculated. The computational details are discussed at some length.

58746 **Experiments concerning electron capture and loss to the continuum and convoy electron production by highly ionized projectiles in the 0.7—8.5-MeV/u range traversing the rare gases, polycrystalline solids, and axial channels in gold.** Breinig, M.; Elston, S.B.; Huldt, S.; Liljeby, L.; Vane, C.R.; Berry, S.D.; Glass, G.A.; Schauer, M.; Sellin, I.A.; Alton, G.D.; Datz, S.; Overbury, S.; Laubert, R.; Suter, M. (University of Tennessee, Knoxville, Tennessee 37916). *Physical Review [Section] A: General Physics;* **25**: No. 6, 3015-3048(Jun 1982).

Velocity spectra of electrons emitted into the forward direction have been measured for 0.7—8.5-MeV/u projectile ions traversing He, Ne, and Ar targets, polycrystalline solids (C, Al, Ag, Au), and axial channels in gold. Spectral shapes and yields are compared and contrasted with one another and with theories which seek to account for the cusp-shaped peaks observed in terms of electron capture and loss to low-lying projectile-centered continuum states. We report the results of both singles and coincidence measurements, where the dependence of cusp shapes and yields on the emergent-ion charge state are examined. For electron capture to the continuum (ECC), variance is noted with respect to the simple, first-order theory of Dettmann, Harrison, and Lucas. The ECC yields are compared to experimental and theoretical studies of bound-state capture, especially to high Rydberg states. For electron loss to low-lying continuum states (ELC), variance is noted with respect to the corresponding theories of Briggs, Drepper, and Day, and ELC cross sections are compared to total electron-loss cross sections. For convoy electron production in solids, no known theory accounts for the results. As in ELC processes, convoy cusp widths are observed to be velocity independent. Convoy electron yields are also observed to be independent of emergent-ion charge state.

58747 **Energy losses and mean free paths of electrons in silicon dioxide.** Ashley, J.C.; Anderson, V.E. (Oak Ridge National Lab., TN). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 6, 4132-4136(Dec 1981). Contract W-7405-ENG-26.

Theoretical models and calculations are combined with experimental optical data to determine a model energy-loss function for SiO_2. Sum-rule checks and comparisons with experimental information are made to insure overall consistency of the model. The model energy-loss function is employed to calculate electron inelastic mean free paths and stopping powers for electrons with energies $\leqq$ 10 keV in SiO_2.

58748 **Inelastic interactions of low-energy electrons with organic solids: simple formulae for mean free paths and stopping powers.** Ashley, J.C. (Oak Ridge National Lab., TN). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **27**: No. 6, 1454-1458(Dec 1980). Contract W-7405-ENG-26.

A theoretical description of the inelastic interactions of low-energy electrons ($E \leqq 10$ keV) with solid organic insulators is presented. The response of the valence electrons to energy and momentum transfers is inferred from a model for the energy-loss function with parameters fixed by optical data. With this model energy-loss function, inverse mean free path and stopping power due to interactions with the valence electrons are calculated for several organic solids. Contributions to the inverse mean free path and stopping power due to K-shell ionization in carbon, nitrogen, and oxygen are obtained from theoretical atomic generalized oscillator strengths. Simple, analytical formulae are deduced which allow predictions of mean free paths and stopping powers for electrons in the energy range 100 eV $\leqq E \leqq$ 10 keV to be made for a large group of organic solids.

58749 Relation among x-ray photoelectron intensities, cross sections and kinetic energies in insulating solids. Howng, W.Y.; Thorn, R.J. (Argonne National Lab., IL). *Journal of Physics and Chemistry of Solids;* **41**: 1147-1155(1980).

The fundamental relation among x-ray (MgK/sub α) photoelectron intensities, theoretical orbital ionization cross sections, and photoelectron kinetic energies has been investigated through precisely measured relative intensities of orbital electrons from sublimed-condensed samples of KF, NaF, CaF_2 and KCl, and other ionic solids. Although the results confirm within approximately 15% the relation and establish a linear dependence of the intensities on analyzer transmission, they suggest that either a slight deviation from the relation exists or a cancellation of errors occurs. Empirically it is found that the relative intensities are proportional to the square of the ratio of kinetic energies, and with this relation, the intensities agree with the theoretical cross sections within a few per cent. This relation suggests that the dependence on the angular parameter is inconsequential and that the mean free path is proportional to the kinetic energy.

58750 (PB—82-157587) Antireflecting sublayers for neutron thin film polarising mirrors. Childs, F.; Hayter, J.B.; Penfold, J.; Williams, W.G. (Science and Engineering Research Council, Chilton (UK). Rutherford Appleton Lab.). [nd]. 36p. (RL—81-082). NTIS, PC A03/MF A01.

Measurements of the neutron polarizing capability of Iron/Cobalt thin film mirrors deposited onto various Gadolinium-rich antireflecting sublayers are presented and the results are compared with theoretical predictions. Excellent results were obtained in the cold neutron region though a degradation in performance is predicted in the thermal region at wavelengths about 1A. 58752 (CEA-CONF—5999) High resolution electron microscopy. Visualization of crystal lattices and of their defects. Desseaux, J. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Dept. de Recherche Fondamentale). Oct 1981. 15p. (In French). (CONF-8109141—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702254.

From Summer school of electron microscopy in material sciences; Bombannes, France (21 Sep 1981).

A great number of fault characterization results may be obtained without calculations simply by observing the pictures: determination of Burgers' vector of dislocations, dissociation of the dislocations, presence of precipitates in the heart of the dislocations, presence of micro-twin-crystals, phase boundaries, etc. Determining the position of the atoms will be facilitated if the phase system approximation can be applied. In those cases where it is necessary to use the calculated image-experimental image comparison, it is fundamental to check the parameters on which the image depends. For the simplicity of the interpretation it is always necessary to obtain images taken in conditions where the structure is the most directly projected and where the image contrast is as stable as possible for a small variation in the parameters: thickness, focusing and crystalline parameters. A few examples are given on silicon.

58753 (DEMO—81/8) Off-diagonal disorder and the metal-insulator transition in impurity bands in semiconductors. Fertis, A.C.; Andriotis, A.N.; Economou, E.N. (Atomic Energy Commission, Athens (Greece)). 1981. 24p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82903466.

Portions of document are illegible.

The role of disorder in the Metal-Insulator (MI) transition in impurity bands in semiconductors is examined by means of a random, one body, tight binding Hamiltonian with pure off-diagonal disorder. A homomorphic cluster CPA is used to calculate the average Green's function and the L(E) criterion is employed to study the localization of electron states. An Anderson transition is found to take place as the impurity concentration reaches a critical value given approximately by n/sub c//sup 1/3/α/sub B//sup */ ≈ 0.16.

Individual items from the conference were prepared separately for the data base. (GHT)

58755 (ITF—80-126P) Theory of electron transfer by solitons. Davydov, A.S. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1980. 49p. (In Russian). Information Dept., Institute for Theoretical Physics-252130, Kiev-130, USSR.

The effect of strong electron-phonon interaction on the electron motion in a molecular chain formed by molecules with constant electric dipole moments is analyzed. The properties of three-dimensional solitons (polarons) in ion crystals, taking into account the optical-phonon dispersion without employing the perturbation theory relative to ion kinetic energy, are discussed.

58756 (ITF—80-138P) Size effects in layer crystals. Lukiyanets, B.A.; Danilevich-Tovstyuk, K.K. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1980. 16p. (In Russian). Information Dept., Institute for Theoretical Physics-252130, Kiev-130, USSR.

The layer crystal phonon mode renormalization by electron-phonon interaction depending on the crystal thickness is considered. It is shown that with sample thickness decreasing the sample is less inclined to form structural instabilities.

58757 (ITF—81-3P) Model energy spectrum and thermodynamical properties of the electron gas in strongly anisotropic crystals: transitional region between three-dimensional (3D) and two-dimensional (2D) or one-dimensional (1D) structures. Bercha, D.M.; Maslyuk, V.T. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1981. 31p. (In Russian). Information Dept., Institute for Theoretical Physics-252130, Kiev-130, USSR.

The strongly anisotropic crystal model spectrum and the electron Hamiltonian in the second quantization form are constructed with due regard to the symmetry of crystals. A nonorthogonality of the wave functions is also taken into account. The temperature and conservation dependence of thermodynamical parameter carriers of current for the simplest layer structures is investigated.

58758 Planar channeling of ions in compound semiconductor superlattices. Barrett, J.H. (Solid State Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Journal of Vacuum Science and Technology;* **21**: No. 2, 384-385(Jul 1982). Contract W-7405-ENG-26.

Computer simulations have been done to show how planar channeling of high-energy ions in compound semiconductor superlattices offers a further means of studying structure at the interfaces in these materials. Such a technique will supplement earlier work with axial channeling concerning offsets at the interfaces in rows of atoms inclined to the surface normal. The method involves having the interface at a depth of 10—20 nm and adjusting the ion energy so that the ions travel about one quarter wavelength in reaching the interface. The tilt angle of the beam relative to the planar channel can be varied to sweep the beam across the channel and make a precise determination of the offset position. This procedure can provide a confirmation of the offset and a more accurate determination of its size.

58759 High-strain-rate plastic flow studied via nonequilibrium molecular dynamics. Hoover, W.G.; Ladd, A.J.C.; Moran, B. (Department of Applied Science, University of California at Davis, Davis, California 95616). *Physical Review Letters;* **48**: No. 26, 1818-1820(28 Jun 1982). Contract W-7405-ENG-48.

Recent experiments at strain rates reaching 0.1 GHz suggest a power-law dependence of solid-phase shear stress on strain rate. Novel nonequilibrium molecular dynamics simulations of plastic flow have been carried out. These steady-state isothermal calculations appear to be consistent with the present-day experimental data and suggest that the flows of metals can be described by a single physical mechanism over a range of strain rates from 10 kHz to 1 THz.

58760 Direct determination of sizes of excitations from optical measurements on ion-implanted GaAs. Aspnes, D.E.; Kelso, S.M.; Olson, C.G.; Lynch, D.W. (Bell Laboratories, Murray Hill, New Jersey 07974). *Physical Review Letters;* **48**: No. 26, 1863-1866(28 Jun 1982). Contract W-7405-ENG-82.

Using a simple model that describes the decrease of the amplitudes of optical structures in ion-implanted crystals, projected areas of several valence and core excitons in GaAs are determined. The last remnant of crystal-related optical structure vanishes for crystallite areas less than $(16\ A)^2$.

58761 Hexatic order and herring-bone packing in liquid crystals. Bruinsma, R.; Aeppli, G. (Brookhaven National Laboratory, Upton, New York 11973). *Physical Review Letters;* **48**: No. 23, 1625-1628(7 Jun 1982). Contract AC02-76CH00016.

A model is proposed for coupling bond-orientational and herring-bone packing degrees of freedom in layered liquid crystals. Three distinct phases are possible: isotropic, and bond-orientationally ordered stacked hexatic with and without herring-bone order. The transition between the two ordered phases is first order. The isotropic-hexatic transition can be driven first order by fluctuations and becomes second order at a tricritical point. Available experimental data are consistent with our model.

58762 Universal behavior of exchange-correlation energy in electron-hole liquid. Vashishta, P.; Kalia, R.K. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review [Section] B: Condensed Matter;* **25**: No. 10, 6492-6495(15 May 1982). Contract W-31-109-ENG-38.

Exchange-correlation energy of electron-hole liquid (EHL) is shown to be independent of different band characteristics of semiconductors. A simple expression of ϵ/sub xc/ for EHL in all semiconductors is given. In units of excitonic rydberg, ϵ/sub xc/ = (a+br/sub s/)/(c+dr/sub s/+r^2/sub s/), where a = -4.8316, b = -5.0879, c = 0.0152, and d = 3.0426. Ground-state and thermodynamic properties calculated with this expression are in good agreement with earlier theoretical calculations and experimental results.

58763 Surface plasmon dispersion on a single-sheeted hyperboloid. Becker, R.S.; Anderson, V.E.; Birkhoff, R.D.; Ferrell, T.L.; Ritchie, R.H. (Oak Ridge National Lab., TN). *Canadian Journal of Physics;* **59**: No. 4, 521-529(1981). Contract W-7405-ENG-26.

The surface-plasmon dispersion relation is obtained for a single-sheeted hyperboloid of revolution. The effects of retardation are neglected, and the electric potential is obtained from Laplace's equation in oblate spheroidal coordinates. Our results are applicable to the description of eigenmodes for a submicron hole in a material which may be supposed to have a local dielectric function.

58764 Surface crystallography by low-energy electron diffraction. Somorjai, G.A.; Kesmodel, L.L. (Lawrence Berkeley Lab., CA). *Transactions of the American Crystallographic Association;* **13**: No. 67, 67-99(1977).

A review of the state of the art in LEED surface crystallography is given. The main features of the theory, the important physical parameters that enter and the most widely used method of surface structure analysis are outlined. Then what has been learned by LEED about the structure of clean solid surfaces and of adsorbates on these surfaces that was not known 10 years ago is reviewed. Finally, several directions of future research is pointed out.

58765 (HU-TFT—81-24) Supercurrents of ^{3}He-A in narrow pores: end effects. Thuneberg, E.V.; Kurkijaervi, J. (Helsinki Univ. (Finland). Research Inst. for Theoretical Physics). 29 May 1981. 23p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702701.

We study supercurrents of ^{3}He-A through narrow pores and find such currents to vanish in many cases because of end effects at the entries and exits of the pores. Under constant pressure DC-supercurrents are found to arise. We also consider the effects of finite frequencies on the end effects.

58766 Development of in situ formed Nb_3Sn-Cu superconducting wire. Sue, J. Ames, IA; Iowa State Univ. (1981). 75p. University Microfilms Order No.81-28,864.Contract W-7405-ENG-82.

Thesis (Ph. D.).

Flux pinning and the optimization of J/sub c/ properties have been studied for in situ prepared Nb_3Sn-Cu superconducting composite wire. The pinning force density is found to be a universal function of magnetic fields as F/sub p/ proportional to H/sup 1/2/$(1-h)^2$ over the full range of reduced field density, h, from h = 0.1 to h = 1.0. The experimental results for a wide range of microstructures show that J/sub c/ is controlled by core pinning on surfaces of grain boundaries, and pinning by shear forces in flux line lattice at high fields is not important. The effective pinning area per unit volume calculated from theory is found to be equal to the area of the interfaces of Nb_3Sn-Nb_3Sn grain boundaries which are perpendicular to the filament axis. An attempt to increase J/sub c/ properties in these wires is made by eliminating C impurities, optimizing as-drawn Nb filament size, and alloying with the third element Ta. J/sub c/ is increased by a factor of 2 to 5 by reducing C content in the alloy from 380 ppmw to 15 ppmw. Optimum Nb filament thicknesses to produce maximum J/sub c/ and H/sub c2/* are found to be 600 A and 700 A for 550°C diffusion annealing and 650°C diffusion annealing, respectively. In addition, Ta additions in the alloy lead to an increase of J/sub c/ at magnetic fields above 12T. It is found that a small amount of Ta in composite wire can raise H/sub c2/* as well as J/sub c/.

58767 (CNRS-CPT—81-P-1317) **Density of states for almost periodic Schroedinger operators and the frequency module: a counter-example.** Bellissard, J.; Scoppolla, E. (Centre National de la Recherche Scientifique, 13 - Marseille (France). Centre de Physique Theorique). Jul 1981. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702226.

We exhibit an example of a one-dimensional discrete Schroedinger operator with an almost periodic potential for which the steps of the density of states do not belong to the frequency module. This example is suggested by the K-theory.

58768 (CNRS-CPT—81-P-1323) **Statistical equilibrium and symplectic geometry in general relativity.** Iglesias, P. (Centre National de la Recherche Scientifique, 13 - Marseille (France). Centre de Physique Theorique). Sep 1981. 12p. (In French). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701960.

A geometrical construction is given of the statistical equilibrium states of a system of particles in the gravitational field in general relativity. By a method of localization variables, the expression of thermodynamic values is given and the compatibility of this description is shown with a macroscopic model of a relativistic continuous medium for a given value of the free-energy function.

58769 (CPT—81/P-1318) **CP_1 model on the torus: contribution of instantons.** Richard, J.L.; Rouet, A. (Centre National de la Recherche Scientifique, 13 - Marseille (France). Centre de Physique Theorique). Jul 1981. 25p. Dep. NTIS (US Sales Only), MF A01. Order Number DE82904586.

Portions of document are illegible.

The contribution of instantons to the partition function is calculated for the two-dimensional CP_1 model defined on the torus.

58770 (EEC—115) **Work and heat in the light of (thermal and laser) light.** Laufer, G. (Technion-Israel Inst. of Tech., Haifa. Energy Engineering Center). Aug 1981. 5p. NTIS (MF) (US Sales Only). Order Number DE82903469.

Portions of document are illegible.

The definitions of work and heat and the relation between these quantities and energy is reviewed. Three expositions are considered and their validity for thermodynamical nonequilibrium processes is examined by applying them to hypothetical experiments where light is made to interact with absorbing systems. The Caratheodory exposition in contrast to the other expositions properly classifies laser interaction with absorbing matter as a work interaction.

58771 (EFI—484(27)-81) **Vacuum polarization by invariant sources.** Ananikian, N.S.; Savvidy, G.K. (Erevanskij Fizicheskij Inst. (USSR)). 1981. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702227.

Vacuum polarization by invariant sources generating the vacuum expectation of classical action S has been studied. The variational method is used for finding out matrix elements. The method essence consists in constructing the effective potential dependent on the matrix elements. The variational problem is formulated and a set of equations determining GITA(PHI, S) is written out. Perturbation theory for GITA is constructed. The problems concerning the renormalization of GITA are discussed.

58772 (IC—79/13) **Comparison, existence, uniqueness and successive approximations for ordinary and elliptic boundary value problems.** Vidossich, G. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 24p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702490.

Bailey, Shampine and Waltman have developed an existence theory for two-point boundary value problems of second-order differential equations whose second members satisfy one-sided Lipshitz conditions. These results suggest that solutions should exist in the following much more general situation: the second member f is bounded by two functions f_1, f_2, such that the corresponding second-order equations have solutions for two-point boundary value problems. The condition $f_1 <= f <= f_2$ implies that if xsub(i) is a solution of the Picard problem xsub(i)″ = fsub(i)(t, xsub(i)), xsub(i)(a) = A, xsub(i)(b) = B, then x_2 and x_1 are, respectively, a lower and an upper solution of the Picard problem x″ = f(t,x), x(a) = A, x(a) = A, x(b) = B. Then a well-known result would imply an affirmative answer to our conjecture if $x_2 <= x_1$. The aim of this paper is to provide a comnparison result and to apply it to uniqueness and existence of solutions as well as to the convergence of successive approximations. The argument is so general that it applies to (i) periodic solutions of first-order ordinary differential equations; (ii) periodic solutions and a large class of Sturm-Liouville problems (including Nicoletti boundary value problem) for second-order ordinary differential equations; and (iii) Dirichlet boundary value problems for elliptic equations.

58773 (IFVE-OTF—81-49) **Collective coordinates on symplectic manifolds.** Razumov, A.V.; Taranov, A.Yu. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701849.

For an arbitrary Lie group of canonical transformations on a symplectic manifold collective coordinates are introduced. They describe a motion of the dynamical system as a whole under the group transformations. Some properties of Lie group of canonical transformations are considered.

58774 (IFVE-OTF—81-91) **Trigonometric and Ssub(N)-symmetric solutions of triangle equations with variables on the faces.** Bazhanov, V.V.; Stroganov, Yu.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 32p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702235.

General properties of triangle equations with variables on faces are discussed. The solution of triangle equations is a main point for study of different problems in quantum mathematical physics. A simple method to search for the solutions of these equations is offered. The statistical vertex model is formulated. The unitarity and crossing symmetry conditions are derived. Solutions of triangle equations for Ssub(N)-symmetric model are obtained.

58775 (IFVE-OTF—81-102) **Homogeneous point canonical transformation in the path integral.** Storchak, S.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701961.

For the homogeneous point canonical transformations in the path integral the method not based on discrete approximation is proposed. The way in which one must change the supplementary condition that fixes the self-adjoint extension of the Hamilton operator in the initial path integrals is shown.

58776 (IFVE-OTF—81-141) **Einstein formula for gravitation radiation is not a consequence of the general relativity theory.** Vlasov, A.A.; Denisov, V.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. 21p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701962.

In the paper it has been shown that the intensity of gravitational radiation and total intensity, defined in the general relativity theory GRT according to Einstein, depend on the choice of a coordinate system. As a result they may turn into zero, and even more, become negative. Therefore the well known Einstein quadrupolar formula, usually used in GRT for calculations, is not a consequence of the GRT and is not contained in it. This result is a particular consequence of a general statement about absence of energy-momentum conservation laws of a system, consisting of matter and gravitational field, in GRT.

58777 (INIS-mf—6968, pp 172-179) **Semiclassical dynamics.** Balazs, N.L. (New York Univ., NY (USA). Dept. of Physics). 1979. NTIS (US Sales Only), PC A18/MF A01.

From Conference on large amplitude collective nuclear motion; Lake Balaton, Hungary (10 Jun 1979).

It is pointed out that in semiclassical dynamics one is encouraged to study the evolution of those curves in phase space which classically represent ensembles corresponding to wave functions. It is shown that the fixed points generate new time scales so that for times longer than the critical times, quantum dynamics will profoundly differ from classical dynamics.

58778 (INS—408) Quantum theory of collective motion: quantized self-consistent collective-coordinate method for the large-amplitude nuclear collective motion. Marumori, T.; Sakata, F.; Une, T.; Hashimoto, Y.; Maskawa, T. (Tokyo Univ. (Japan). Inst. for Nuclear Study). Apr 1981. 26p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82903655.

Portions of document are illegible.

This is the third in a series of papers which intends to develop a new microscopic theory capable by itself to determine the maximal-decoupled collective subspace in the many-particle Hilbert space as well as the collective Hamiltonian specifying the subspace. The fundamental principle to formulate the theory is called the invariance principle of the Schroedinger equation. The main purpose of this paper is to show that, when we positively utilize the invariance principle, we can directly obtain a quantum theory of collective motion going beyond the random phase approximation.

58779 (ITEF—82(1980)) "Asymptotic freedom" in quantum mechanics. Vajnshtejn, A.I.; Zakharov, V.I.; Novikov, V.A.; Shifman, M.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1980. 27p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702237.

Sum rules in quantum mechanics true for nonsingular potentials are considered. The physical content of sum rules is reduced to the fact that at small distances the interaction energy is small as compared with kinetic energy and the interaction may be considered as perturbation. In this sense there exists a direct analogy with quantum chromodynamics sum rules, previously discussed in detail. The common character of the situation found for the first time in the case of quantum chromodynamics: if the interaction grows fast with the distance increase one may obtain sum rules which on the one hand use Born approximation of interaction, on the other - they are saturated by one-two low levels.

58780 (JINR—E-2-81-449) 1/N-expansion for the anharmonic oscillator. Koudinov, A.V.; Smondyrev, M.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701851.

The properties of the 1/N-expansion for the anharmonic oscillator in quantum mechanics have been investigated. The first seven terms of the expansion for the energy of ground and first excited levels are obtained analytically. The high-order behaviour of the 1/N-expansion coefficients in closed form was found, the asymptotic series obtained being Borel summable. The formulae derived was used to find the first seven coefficients of the perturbative expansion in powers of the coupling constant in the case of the double-well potential for arbitrary number of components N. These exact expressions enable us to guess the large-order behaviour of the perturbative coefficients for N=0, 1, ... 4. An example of summing the asymptotic series in powers of 1/N applying the Pade-Borel method is given.

58781 (JINR—E-2-81-540) Nonlinear Schroedinger equation with U(p,q) isotopical group. 2. The U(1,1) system. Makhankov, V.G.; Pashaev, O.K. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1981. 24p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701852.

The properties of the nonlinear Schroedinger equation (NLS) with U(1,1) isogroup are considered in detail. This example illustrates the essential difference between the system and the well-known "vector" NLS, i.e. the large set of allowed boundary conditions on the fields that leads to a rich set of solutions of the system. Four types of boundary conditions and related soliton solutions are considered. The Bohr-Sommerfeld quantization allows to interpret them in terms of "drops" and "bubbles" as bound states of a large number of constituent bosons subject to the thermodynamical relations for gas mixtures. The U(1,1) system under the vanishing boundary conditions may be considered as continuous analog of the Hubbard model and therefore the paper is concluded by studying the inverse scattering equations for this case.

58782 (JINR—E-2-81-609) Complex-potential description of the damped harmonic oscillator. Pt. 2. The one-dimensional case. Exner, P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701964.

The propagator of multidimensional damped harmonic oscillator described by a non-selfadjoint Hamiltonian with complex potential was found earlier. The one-dimensional case is treated in detail with the following results. The non-damped limit gives correct propagator including Maslov phase factor. For some initial conditions, classical limit of the solution can differ from the behaviour of the classical damped oscillator, the difference being negligible in the case of weak damping. Point spectrum of the considered pseudo- Hamiltonian is found.

58783 (JINR—R-2-81-31) Lax representation for nonlinear evolution equations. Nesterenko, V.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 4p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702494.

It is shown by the methods of classical differential geometry that in case of two independent variables the nonlinear equation in frequency derivatives of the second order of general type can be presented in operator Lax form. Linear equations describing alternation of mobile reper during movement of its beginning along the integral surface of the initial nonlinear equation are used as operators. The problem of introducing spectral parameter into Lax representation is discussed.

58784 (JINR—R-2-81-403) Analog of the Feynman-Gell-Mann equation for a spin 1 charged particle. Leonovich, A.A.; Pestov, A.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 5p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701853.

A relativistic wave equation is proposed for a spin 1 charged particle. The wave function of such a particle is represented by a self-dual antisymmetric tensor of second rank. The equation proposed is analogous to the known Feynman- Gell-Mann equation for spin 1/2 particles. An exact solution is obtained for the problems of motion in the Coulomb field, in the field of a plane electromagnetic wave and in the uniform magnetic field.

58785 (JINR—R-2-81-466) Extension of the Einstein space classification to N=1 supergravity. Kalitsin, S.N.; Ogievetskij, V.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702241.

In N=1 supergravity the Weyl tensor and the spin-vector field strength are incorporated in the same supermultiplet. Respectively, the Petrov-classification of the Weyl tensor, yields some conditions on the gravitino field strength. These constraints are especially simple for the degenerate types and in a linearised approximation, having there a simple interpretation.

58786 (JINR—R-5-81-372) Polyspheroidal wave functions. Truskova, N.F. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1981. 24p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701854.

Necessary in a number of physical problems solutions of Helmholtz equation in coordinate system of N-dimensional (N>=4) rotation ellipsoids and hyperboloids are obtained. These solutions are expressed via new special functions which particular cases are spheroidal and hyperspheroidal functions. Analytical expressions are found and main properties of new functions are considered.

58787 (KFTI—80-50) **Electromechanical instability of oscillatory circuit in external electromagnetic field.** Moskovchenko, I.V.; Repalov, N.S.; Sidorenko, I.S. (AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.). 1980. 15p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701837.

6 refs.; 3 figs.; 1 tab.

Electromechanical vibrations of the elastic oscillatory circuit placed in an external electromagnetic field caused by the effect of the reserved in the circuit of electromagnetic energy on its radiochemical parameters are considered. The purpose of the study has been to obtain qualitative and quantitative characteristics of the electromechanical vibrations process. The system of two nonlinear equations describing electromechanical processes in the circuit has been solved by the method of solution expansion in a series by the small parameters. In static approximation obtained are the nonlinear oscillation resonance curve equation as well as relations determining the critical parameters of the circuit and its supply system at which electromechanical vibrations are possible. The self-excited oscillation mode and the problem on circuit oscillation stability are considered.

58788 **(PM—81/10) Completion theorem relative to one-dimensional Schroedinger equations with energy-dependent potentials.** Jean, C. (Montpellier-2 Univ., 34 (France). Dept. de Physique Mathematique). Oct 1981. 34p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82904245.

Portions of document are illegible.

58789 **(PM—81/12) Generalization of IST via asymptotically oscillating potentials.** Leon, J.J.P. (Montpellier-2 Univ., 34 (France). Dept. de Physique Mathematique). 1981. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82904091.

We study the inverse spectral transform (IST) for a Dirac equation in which the potentials possess x and t-dependent asymptotic behaviors. The result of IST provides a new set of solutions of the same class of nonlinear evolution equations as that obtained previously for the standard Dirac equation. It is shown that such new solutions are obtained when assuming for the spectral data a certain type of nonisospectral evolution.

58790 **Resonances and analyticity of scattering wave function for square-well-type potentials.** Weber, T.A.; Hammer, C.L.; Zidell, V.S. (Ames Laboratory—DOE and Department of Physics, Iowa State University, Ames, Iowa 50011). *American Journal of Physics;* **50**: No. 9, 839-845(Sep 1982). Contract W-7405-ENG-82.

In this paper we extend our previous analysis of the scattering of wave packets in one dimension to the case of the square-well potential. The analytic properties of the general scattering solution are emphasized thereby making the analysis useful as introductory material for a more sophisticated S-matrix treatment. The square-well model is particularly interesting because of its application to the deuteron problem. Resonance scattering, barrier penetration, time delay, and line shape are discussed at the level of the first-year graduate student.

58791 **Electron momentum modulation by the stimulated Cerenkov interaction.** Kimura, W.D. (Stanford University, Stanford, California 94305). *Journal of Applied Physics;* **53**: No. 8, 5435-5439(Aug 1982).

Momentum modulation of relativistic electrons by laser light using the stimulated Cerenkov interaction is analyzed. This interaction is accomplished by introducing a gas whose index of refraction retards the phase velocity of the light wave. By intersecting the electron and laser beams at the Cerenkov angle, θ/sub c/ = $\cos^{-1}(1/n\beta)$, where n is the index of refraction of the gas, and β is the ratio of the electron velocity over the velocity of light in vacuum; the electrons remain in a field of constant phase resulting in a cumulative energy exchange. The laser-induced change in particle momentum and the electron beam energy spectrum are analyzed as a function of the electron and laser-beam characteristics. The results agree with a computer simulation of the interaction.

58792 **Einstein gravity as a symmetry-breaking effect in quantum field theory.** Adler, S.L. (The Institute for Advanced Study, Princeton, New Jersey 08540). *Reviews of Modern Physics;* **54**: No. 3, 729-766(Jul 1982). Contract AC02-76ER02220.

This article gives a pedagogical review of recent work in which the Einstein-Hilbert gravitational action is obtained as a symmetry-breaking effect in quantum field theory. Particular emphasis is placed on the case of renormalizable field theories with dynamical scale-invariance breaking, in which the induced gravitational effective action is finite and calculable. A functional integral formulation is used throughout, and a detailed analysis is given of the role of dimensional regularization in extracting finite answers from formally quadratically divergent integrals. Expressions are derived for the induced gravitational constant, for the induced cosmological constant, and for quantized matter theories on a background manifold, and a strategy is outlined for computing the induced constants in the case of an SU(n) gauge theory. By use of the background field method, the formalism is extended to the case in which the metric is also quantized, yielding a derivation of the semiclassical Einstein equations as an approximation to quantum gravity, as well as general formulas for the induced (or renormalized) gravitational and cosmological constants.

58793 **Chaotic attractors in crisis.** Grebogi, C.; Ott, E.; Yorke, J.A. (Laboratory for Plasma and Fusion Energy Studies, University of Maryland, College Park, Maryland 20742). *Physical Review Letters;* **48**: No. 22, 1507-1510(31 May 1982). Contract AC02-76ER03075.

The occurrence of sudden qualitative changes of chaotic (or "turbulent) dynamics is discussed and illustrated within the context of the one-dimensional quadratic map. For this case, the chaotic region can suddenly widen or disappear, and the cause and properties of these phenomena are investigated.

58794 **Quantum solution of the Calogero system by the projection method.** Gipson, J.M. (J. W. Gibbs Laboratory, Physics Department, Yale University, New Haven, Connecticut 06511). *Physical Review Letters;* **48**: No. 22, 1511-1514(31 May 1982). Contract AC02-76ER03075.

The projection method is a constructive proof of complete integrability of classical many-body systems. This method is extended to the quantum case. The wave functions and propagators of the n-particle Calogero systems are given in the form of integrals involving the wave functions and propagators of free motion in a space of n^2 dimensions. Quantization of angular momentum in the large space yields solutions for discrete values of the coupling constant.

58795 **Nonconventional optical systems and brightness theroem.** Welford, W.T.; Winston, R. (Imperial College, Blackett Laboratory, London, SW7 2BZ, U.K.). *Applied Optics;* **21**: No. 9, 1531-1533(1 May 1982).

The brightness on radiance theorem in geometrical optics is reviewed and restated according to the laws of physics. (AIP)

58796 **Large N limits as classical mechanics.** Yaffe, L.G. (California Institute of Technology, Pasadena, California 91125). *Reviews of Modern Physics;* **54**: No. 2, 407-435(Apr 1982). Contract AC03-76ER00068.

This paper discusses the sense in which the large N limits of various quantum theories are equivalent to classical limits. A general method for finding classical limits in arbitrary quantum theories is developed. The method is based on certain assumptions which isolate the minimal structure any quantum theory should possess if it is to have a classical limit. In any theory satisfying these assumptions, one can generate a natural set of generalized coherent states. These coherent states may then be used to construct a classical phase space, derive a classical Hamiltonian, and show that the resulting classical dynamics is equivalent to the limiting form of the original quantum dynamics. This formalism is shown to be applicable to the large N limits of vector models, matrix models, and gauge theories. In every case, one can explicitly derive a classical action which contains the complete physics of the $N = \infty$ theory. "Solving" the $N = \infty$ theory requires minimizing the classical Hamiltonian, and this has been possible only in simple theories. The relation between this approach and other methods which have been proposed for deriving large N limits is discussed in detail.

58797 Network loading of thin-wire antennas and scatterers in the time domain. Landt, J.A. (Los Alamos National Lab., NM). *Radio Science;* **16**: No. 6, 1241-1247(Nov 1981).

A numerical technique is presented that is capable of calculating the transient response of a thin-wire antenna or scatterer loaded by a network. The electromagnetic formulation is an adaptation of a well-validated and widely used code. This code is based on an electric field integral equation and employs point matching and nine-point Lagrangian interpolation functions. The network is treated by a nodal analysis and can contain a finite number of lumped and possibly nonlinear elements. The formulation is cast in the time domain, and the solution is obtained by a time-stepping procedure. The numerical approach is outlined, and the responses of several examples are presented.

58798 Radiative transfer in spectrally-dissimilar absorbing-emitting-scattering adjacent mediums. Im, K.H.; Ahluwalia, R.K. (Argonne National Laboratory, Argonne, IL). pp 11p, Paper 81-1091 of 16th thermophysics conference. Los Angeles, CA; American Institute of Aeronautics and Astronautics (1981). Contract W-31-109-ENG-38.

From 16. thermophysics conference; Palo Alto, CA, USA (23 Jun 1981).

The structure of a radiation field in a cylindrical medium having two regions of different, but uniform absorption and scattering coefficients is analyzed. Fundamental aspects of the problem are elucidated by considering the case of a gray medium. It is shown for example that, for unequal absorption coefficients in the two regions, both emission and absorption rates are discontinuous at the interface of the two regions, but the heat flux and incident radiation are continuous. As an application of the analysis, the influence on heat transfer of the spatial distribution of particles in a coal-burning swirl combustor is investigated. In the example application, spectral calculations are performed spanning the broad frequency range of the thermal radiation spectrum.

58799 Los Alamos Conference on Optics. Liebenberg, D.H. Palos Verdes Estates, CA; Society of Photo-Optical Instrumentation Engineers (1979). 550p. (CONF-790529—).

From Conference on Optics; Los Alamos, NM, USA (23 May 1979).

The Conference focused on optical components, optics for laser fusion, laser and detectors, and applications of optics in diagnostics. Papers were given on holographic optical elements, a laser beam expander, multi-terawatt CO_2 laser fusion systems, Helios beam diagnostics, the Antares beam alignment system, an optically pumped CF_4 laser system, multipulse energy extraction in CO_2 laser amplifiers, fiber optics applications in plasma diagnostics, phase conjugation on CO_2 lasers, high power gas lasers and spectroscopy, and interferometry and applications to optical testing.

58800 Scattered-light measurements of optical surfaces. Smartt, R.N. (Sacramento Peak Observatory, Sunspot, NM). pp 58-66 of Los Alamos Conference on Optics. Liebenberg, D.H. Palos Verdes Estates, CA; Society of Photo-Optical Instrumentation Engineers (1979).

From Conference on Optics; Los Alamos, NM, USA (23 May 1979).

Measurements of the angular distribution of scattered light produced by specially-polished optical components are reported. The components were six 12-cm aperture coronagraph objective mirrors and two 20-cm coronograph objective lenses. For each test the component was illuminated with white light and the magnitude of the scattered flux measured at several field points. It was not feasible to separate surface and body scattering of the lenses, so that these measurements represent the combined contributions. Successive recoatings and tests of the mirrors has led to the conclusion that the residual roughness of the substrate polish is the dominant parameter that determines the magnitude of the scattered flux. Dark ground and phase contrast measurements qualitatively support this conclusion. The fractional contributions of integrated scattered light of the lenses and mirrors are found to be of the same order, although the functional relationships are significantly different over the angular range measured.

REFER ALSO TO CITATION(S) 57817, 58349, 58545, 58736

58801 (CEA-N—2257) Boltzmann equation in 1D-spherical and cylindrical geometry. Specifications of the ORPHEE code. Verwaerde, D. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Sep 1981. 66p. (In French). NTIS (US Sales Only), PC A04/MF A01. Order Number DE82702223.

Specifications of ORPHEE (a neutronic time-independent code for 1D-spherical or cylindrical-geometry) are given. The various forms of Boltzmann's equation, with respect to the kind of symmetry are presented. The development of the anisotropic source is studied and then it is shown how to build finite difference schemes in order to get a good approximation of this equation.

58802 (CNRS-CPT—81-P-1311) Almost periodic Hamiltonians: an algebraic approach. Bellissard, J.; Testard, D. (Centre National de la Recherche Scientifique, 13 - Marseille (France). Centre de Physique Theorique). Jul 1981. 48p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702224.

We develop, by analogy with the study of periodic potential, an algebraic theory for almost periodic Hamiltonians, leading to a generalized Bloch theorem. This gives rise to results concerning the spectral measures of these operators in terms of those of the corresponding Bloch Hamiltonians.

58803 (IC—79/9) Priori bounds for solutions of two-point boundary value problems using differential inequalities. Vidossich, G. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 10p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702233.

Two point boundary value problems for systems of differential equations are studied with a new approach based on differential inequalities of first order. This leads to the following results: (i) one-sided conditions are enough, in the sense that the inner product is substituted to the norm; (ii) the upper bound exists for practically any kind of equations and boundary value problem if the interval is sufficiently small since it depends on the Peano existence theorem; (iii) the bound seems convenient when the equation has some singularity in t as well as when sigular problems are considered.

58804 (IC—79/10) Existence of positive solutions for non-linear elliptic equations. Vidossich, G. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702228.

The author proves some theorems concerning the existence of positive solutions of the elliptic Dirichlet problem $L(u) = f(x,u)$, $u/\Delta\Omega\Xi 0$ where $f(x,u) >= 0$ for $u> = 0$.

58805 (IC—79/11) Comparison, existence, uniqueness and successive approximations for two-point boundary value problems. Vidossich, G. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 28p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702229.

Bailey, Shampine and Waltman developed an existence theory for two-point boundary value problems of second order differential equations whose second members satisfy one-sided Lipschitz conditions. It is suggested that solutions should exist in a much more general situation. A comparison result is given and applied to uniqueness and existence of the Picard problem as well as to the convergence of successive approximation for this.

58806 (IC—79/12) **Two remarks on the stability of ordinary differential equations.** Vidossich, G. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 15p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702230.

In this note the definition of Liapunov functions is extended, obtaining a generalization of the recent result by Lakshmikantham and Leela on the perturbation of Liapunov functions, and two sufficient conditions for the solvability of Olech's problem on global stability are pointed out.

58807 (IC—79/14) **Two fixed-point theorems related to eigenvalues with the solution of Kazdan-Warner's problem on elliptic equations.** Vidossich, G. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 19p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702231.

The paper presents a proof of two fixed-point theorems, which unify previous results on periodic solutions of second-order ordinary differential equations, in the sense that the existence part of these solutions become a corollay of the fixed-point theorems.

58808 (IC—79/15) **Existence and uniqueness results for boundary value problems from the comparison of eigenvalues.** Vidossich, G. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1979. 33p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702232.

The paper treats the existence and uniqueness of solutions for nonlinear boundary value problems by comparing, in a suitable way, the nonlinear term with the eigenvalues of the linear part.

58809 (JINR—E-2-81-604) **Complete set of highest-weight representation for SL(3,C).** Burdik, C.; Havlicek, M.; Exner, P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1981. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701963.

Infinite-dimensional highest-weight representations (HWRs) of sl(3, C) are constructed using canonical (boson) realizations of this algebra. The method applies to all weights except for the cases in which the irreducible HWRs are finite-dimensional. The obtained representations are irreducible and such that matrix elements of their generators are easily calculated.

58810 (JINR—R-2-81-633) **Correction of the fermion Green function.** Duong Van Phi; Nguen Mong Giao. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1981. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701966.

The formalism of interaction field theory in the unified space is used to calculate the correction of the fermion Green function in the fourth order of perturbation theory. The result is finite. It is applied to correct the matrix element of the Compton effect. For this purpose the unitarity condition is also proved.

58811 (LRP—179/80) **Numerical solution to a continuity equation.** Vittoz, J.C.; Appert, K.; Muschietti, L. (Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland)). Dec 1980. 32p. (In French). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82903474.

A study is made of the properties of numerical solutions which result in the integration of a continuity equation with the aid of Lagrange type third degree finite elements. The adjunction of a small artificial diffusion term is shown to diminish substantially the phase errors inherent in discretization. Following optimization, such a method approaches the performance of a simple F.C.T. diagram. 10 references, 8 figures.

58812 **Korteweg-de Vries surfaces and Baecklund curves.** Kupershmidt, B.A. (Los Alamos Scientific Laboratory, Los Alamos, New Mexico 87545). *Journal of Mathematical Physics (New York);* **23**: No. 8, 1427-1432(Aug 1982).

It is shown that every point $w(\epsilon)$ on the curve γ/sub r/ (ϵ) representing a 1-parameter family of integrable equations containing a given rth Korteweg—de Vries (KdV) equation w(0), also belongs to a different integrable curve Γ/sub r/(ϵ,ν) . Symmetries of the resulting surface make it possible to construct a curve of Baecklund transformations, that is, infinitesimal automorphisms, of points on γ/sub r/ (ϵ) starting with the usual infinitesimal automorphisms of w(0). In addition, we obtain four new Baecklund transformations of the second order for all higher KdV equations.

58813 **Analysis of Taylor's theory of toroidal plasma relaxation.** Faber, V.; White, A.B. Jr.; Wing, G.M. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Mathematical Physics (New York);* **23**: No. 8, 1524-1537(Aug 1982).

The Taylor theory of toroidal plasma relaxation is considered as a nonlinear eigenvalue problem. The analysis is rigorous and applies to quite general toroidal cross sections. Emphasis is placed on the symmetric state case, where the existence of field reversal and flux free states is demonstrated. Certain anomalies are revealed by the mathematical treatment and their significance is studied. Existence of a solution to the Taylor problem in the symmetric state is proved and the location of the eigenvalue of this solution state relative to other states is examined. The question of the existence of helical states is not resolved, but it is shown that in many respects any helical states behave like the anomalous cases in the symmetric problem and hence do not significantly affect the theory.

70 FUSION ENERGY

58814 (DOE/ER—0132) **Technology spin-offs from the magnetic fusion energy program.** (Department of Energy, Washington, DC (USA)). May 1982. 167p. NTIS, PC A08/MF A01. Order Number DE82016923.

A description is given of 138 possible spin-offs from the magnetic fusion program. The spin-offs cover the following areas: (1) superconducting magnets, (2) materials technology, (3) vacuum systems, (4) high frequency and high power rf, (5) electronics, (6) plasma diagnostics, (7) computers, and (8) particle beams. 58815 (AD-A—108799/8) **Level shifts and inelastic electron scattering in dense plasmas. Memorandum report.** Davis, J.; Blaha, M. (Naval Research Lab., Washington, DC (USA)). 10 Dec 1981. 35p. (NRL-MR—4689). NTIS, PC A03/MF A01.

A completely quantum mechanical formalism has been developed to describe the high density plasma effects on fundamental atomic parameters. Both the bound and free electrons are treated by a method which in principle is similar to Hartree's self-consistent field method. The free plasma electrons' wave-function is obtained from the Schrodinger equation with the effective potential representing the spherically averaged Coulomb interaction with bound and free electrons. Results are given for level shifts, coefficients of transition probabilities, and electron collision cross sections of Ne(9+) for temperature and 200 and 500 e V for an electron density range of 1 - 6 x 10 to the 24th power/cc, and of Ar(17+) for temperatures of 1000 and 2000 eV and electron densities from 2 x 10 to the 25th power to 8 x 10 to the 25th power/cc. In the low-density region, level shifts are obtained for H and He+.

58816 (AD-A—109041/4) **The cavity Q for ergodic eigenmodes. Memorandum report.** Ott, E.; Manheimer, W.M. (Naval Research Lab., Washington, DC (USA)). 22 Dec 1981. 8p. (NRL-MR—4641). NTIS, PC A02/MF A01.

We consider here the problem of calculating the Q of a very overmoded, (wavelength $<<$ cavity size) irregularly shaped resonant cavity due to absorption of the electromagnetic radiation at the walls. We assume further that the volume inside the cavity can be either vacuum, or else partially filled with anisotropic inhomogeneous dielectric or plasma. Both the scale length of the dielectric and the radius of curvature of the walls are assumed much larger than the radiation wavelength. However, near the cavity walls, a vacuum is assumed. Our main interest here is in applications concerning magnetically confined plasmas. For instance consider a tokamak containing a hot plasma which radiates at the cyclotron frequency and its harmonics. An important issue is how much of this cyclotron radiation is absorbed by the walls and how much is reabsorbed by the plasma. Generally this can be calculated with a ray tracing code where many rays are followed and the absorbtion and emission are calculated along each ray path. However if the plasma is optically thin, as it would be at the higher harmonics, and if the reflection coefficient at the wall is near unity the rays would have to be followed for long distances before one could see how much energy is deposited in the wall. In this paper we utilize the ergodic theorem to calculate the wall absorbtion for the case where the wave makes many bounces and before it is absorbed.

58817 **(AD-A—111349/7) Dynamics of a rotating proton layer along a magnetic ramp. Final report.** Golden, J.; Pasour, J.A.; Kapetanakos, C.A.; Marsh, S.J.; Pershing, D.E. (Naval Research Lab., Washington, DC (USA)). 31 Dec 1981. 57p. (NRL-MR—4699). NTIS, PC A04/MF A01.

The dynamics of a rotating proton layer containing 2 - 6 x 10 to the 16th power protons of 1 - 1.5 MeV energy propagating in vacuum along a ramp mangetic field have been studied experimentally and by computer simulation. The layer is produced by passing the annular proton pulse produced by an Inverse Reflex Tetrode (IRT) through a magnetic cusp. The diamagnetic self-magnetic field (as high as 1.6 times the applied field) and the radial oscillations of the layer are monitored. The axial velocity of the pulse is determined, and a maximum of 1.7 is obtained for the ratio of azimuthal to axial velocity. The layer has also been propagated along the ramp in the presence of a neutral gas cloud with pressure approximately greater than 0.1 Torr. Computer simulation of the experiment uses an axisymmetric particle-in-cell code that includes self- and external- Bz and Br magnetic fields and the inductive E theta electric field. Calculated contour maps of the particle and current densities of the beam at selected times are presented. The computer particle density profile, the ratio v theta/vz, and the magnitude of the diamagnetic signals are in qualitative agreement with the observations.

58818 **(AD-A—111508/8) On Kraichnan's 'direct interaction approximation' and Kolmogoroff's theory in two-dimensional plasma turbulence.** Kulsrud, R.M.; Sudan, R.N. (Cornell Univ., Ithaca, NY (USA). Lab. of Plasma Studies). Apr 1981. 12p. (LPS—293). NTIS, PC A02/MF A01.

The nonlinear damping in a strongly turbulent convecting plasma computed by Kraichnan's modified direct inteaction approximation and the power spectrum are rederived in a physically transparent form using Kolmogoroff's theory of turbulence.

58819 **(CEA-N—2242) Compendium of laser plasma interaction.** Bobin, J.L. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Oct 1981. 148p. (In French). NTIS (US Sales Only), PC A07/MF A01. Order Number DE82702261.

Basic mechanisms, linear and non linear, are reviewed. Absorption through inverse Bremsstrahlung, through wave-wave couplings; resonant absorption; wave breaking; ponderomotive force; harmonic generation; magnetic field generation. Subsequent plasma flows are described.

58820 **(CONF-810439—4) Method for obtaining electron energy-density functions from Langmuir-probe data using a card-programmable calculator.** Longhurst, G.R. (EG and G Idaho, Inc., Idaho Falls (USA)). 1981. Contract AC07-76ID01570. 6p. NTIS, PC A02/MF A01. Order Number DE82005270.

From 15. AIAA/JSASS/DGLR international electromagnetic propulsion conference; Las Vegas, NV, USA (21 Apr 1981).

This paper presents a method for obtaining electron energy density functions from Langmuir probe data taken in cool, dense plasmas where thin-sheath criteria apply and where magnetic effects are not severe. Noise is filtered out by using regression of orthogonal polynomials. The method requires only a programmable calculator (TI-59 or equivalent) to implement and can be used for the most general, nonequilibrium electron energy distribution plasmas. Data from a mercury ion source analyzed using this method are presented and compared with results for the same data using standard numerical techniques.

58821 **(CONF-811113—45) Deposition probe measurements of impurity and plasma fluxes near the wall in ISX-B.** Zuhr, R.A.; Roberto, J.B.; Withrow, S.P. (Oak Ridge National Lab., TN (USA)). 1981. Contract W-7405-ENG-26. 6p. NTIS, PC A02/MF A01. Order Number DE82004062.

From American Vacuum Society national symposium; Anaheim, CA, USA (3 Nov 1981).

Portions of document are illegible.

It was shown that metallic impurity fluxes to the wall are far lower (x 3000) than those to limiter-like probes located 2 cm outside the limiter radius. Deuterium fluxes are also lower (x 10) at the wall position and are in reasonable agreement with single crystal silicon damage data. Finally, both wall and limiter position data are consistent with an impurity introduction model in which charge exchange neutral sputtering of the wall is the dominant introduction mechanism.

58822 **(DOE/DP/40016—T1) Low-frequency electric-microfield distributions in a plasma containing multiply-charged ions: extended calculations.** Tighe, R.J.; Hooper, C.F. Jr. (Florida Univ., Gainesville (USA). Dept. of Physics). 12 Nov 1976. Contract AS05-76DP40016. 23p. NTIS, PC A02/MF A01. Order Number DE82015634.

The formalism needed for the computation of electric microfield distributions in plasmas is extended as follows: (1) the perturbing ions and electrons in the plasma are allowed to have different kinetic temperatures; (2) two species of perturbing ions, of charge z_1 and z_2, may be present in any given proportion. Computed results are presented graphically for parameter ranges which are of interest in the study of laser-produced plasmas.

58823 **(DOE/DP/40016—T2) Study of stark broadening of high-Z hydrogenic ion lines in dense hot plasmas.** Tighe, R.J. (Florida Univ., Gainesville (USA). Dept. of Physics and Astronomy). 23 May 1977. Contract AS05-76DP40016. 259p. NTIS, PC A12. Order Number DE82015631.

Thesis.

Stark broadened x-ray line profiles from highly ionized hydrogenic ions, radiating while immersed in a hot dense plasma, are studied. The broadening effects produced by the ions present in the plasma are treated through the use of static electric microfield distribution functions. The microfield distribution functions employed have the following properties: (1) the radiating hydrogenic ion may have any net charge; (2) the perturbing ions and electrons in the plasma may have different kinetic temperatures; and (3) two species of ions, of charge z_1 and z_2, may be present in any given ratio.

58824 **(DOE/DP/40016—T3) X-ray line broadening as a diagnostic in laser-produced plasmas. Progress report.** Hooper, C.F. Jr. (Florida Univ., Gainesville (USA)). Jul 1978. Contract AS05-76DP40016. 4p. NTIS, PC A02/MF A01. Order Number DE82015633.

Research continues on developing theoretical formulations of spectral-line broadening (in plasmas) applicable to the diagnosis of pellet implosions. Numerous plasma-broadened Lyman profiles (α, β, γ) have been calculated for various ionic radiators, under a variety of plasma conditions. These are tabulated in the accompanying technical report. Corresponding tables of electric-modified-distribution functions are also included.

58825 **(DOE/DP/40016—T4) X-ray line broadening as a diagnostic in laser-produced plasmas.** Hooper, C.F. Jr.; Woltz, L.A. (Florida Univ., Gainesville (USA). Dept. of Physics and Astronomy). 1981. Contract AS05-76DP40016. 45p. NTIS, PC A03/MF A01. Order Number DE82015632.

A compilation is given of plasma-broadened Lyman-line profiles, and the corresponding ion-microfield distribution functions. (MOW)

(Washington Univ., Seattle (USA). Dept. of Aerospace and Energetics Research). 1982. Contract AT06-76ET53047. 139p. (UWFPP—28). NTIS, PC A07/MF A01. Order Number DE82020186.

Portions of document are illegible.

Results are given for work during this period on each of the following areas: (1) spheromak production using conical theta pinch guns; (2) detection of CT fluctuation spectra via CO_2 forward scattering; (3) high density field reversal experiment; (4) plasma compression experiment; (5) material end plugging experiment; and (6) design of computerized data acquisition systems. (MOW)

58827 (EUR—6584(Vol.1), pp 3-17) **Neoclassical impurity transport.** Stringer, T.E. (JET Joint Undertaking, Abingdon (UK)). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

The neo-classical theory for impurity transport in a toroidal plasma is outlined, and the results discussed. A general account is given of the impurity behaviour and its dependence on collisionality. The underlying physics is described with special attention to the role of the poloidal rotation.

58828 (EUR—6584(Vol.1), pp 19-46) **Empirical approach to Tokamak transport.** Hawryluk, R.J. (Princeton University (USA)). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

This lecture present an overview of the important considerations related to particle and energy transport in a tokamak. Transport in tokamaks can be inferred by analyzing the experimental data in terms of the one dimensional magnetic field diffusion equation and the particle and energy conservation equations. This approach is illustrated by considering current penetration during the start up phase, density buildup in high density discharges, as well as the ion and electron energy balance in PLT ohmically heated discharges. Areas requiring further research will be discussed.

58829 (EUR—6584(Vol.1), pp 81-99) **Collisional transport in tandem mirrors.** Ryutov, D.D. (Institute of Nuclear Physics, Novosibirsk, USSR). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

The absence of axial symmetry of Tandem Mirror devices results in some quite undesirable effects. Among them the least investigated one (and potentially most dangerous) is the influence of the distortions of the magnetic surfaces on resonant diffusion. The enhanced electron thermal conductivity due to the "non-omnigeneity" of drift trajectories in the end cells should also be a subject of concern. In the case of plasma with very low β it is possible to reduce these effects by appropriate tailoring of the magnetic field distribution in the transition regions. However, it is not quite clear whether this method will work for the practically interesting values of β. A more radical solution of these problems was suggested by TSEL'NIK (1978). It consists in using the entirely axisymmetric central cell and addition of two more short axisymmetric cells between the central cell and each of the end cells. By maintaining high plasma density in the intermediate cells one can create electrostatic barriers, while non-axisymmetric end cells will provide average minimum B. Of course, it is not quite clear whether this configuration will be MHD-stable at reasonable values of β. The final judgement on the real significance of the problems discussed here will come from the experiments on TMX, AMBAL-1 and other tandems.

58830 (EUR—6584(Vol.1), pp 101-127) **Anomalous transport in mirror systems.** Post, R.F. (Univ. of California, USA). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

As now being explored for fusion applications confinement systems based on the mirror principle embody two kinds of plasma regimes. These two regimes are: a) High-beta plasmas, stabilized against MHD and other low frequency plasma instabilities by magnetic-well fields, but characterized by non-maxwellian ion distributions. b) Near-maxwellian plasmas, confined electrostatically (as in the tandem mirror) or in a field-reversed region within the mirror cell. Common to both situations are the questions of anomalous transport owing to high frequency instabilities in the non-maxwellian portions of the plasmas. This report will summarize the status of theory and of experimental data bearing on these questions, with particular reference to the high temperature regimes of interest for fusion power.

58831 (EUR—6584(Vol.1), pp 129-142) **Tearing modes in tokamaks.** Rutherford, P.H. (Princeton Univ., USA). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

It has been conclusively established by a variety of diagnostic techniques that low-m tearing modes occur in present-day tokamak devices. By acting as precursors to the disruptive instability, these modes serve to limit the parameter regime that can be obtained. In this lecture, the basic physics of tearing modes is reviewed, and the linear stability criteria for a number of tokamak current profiles are delineated. Optimum current profiles are discussed. On the basis of the energy available to drive $m=2$, $n=1$ and $m=3$, $n=2$ modes, the circumstances that can lead to strong disruptions can be identified. The role of electron cross-field viscosity in driving tearing modes is also discussed.

58832 (EUR—6584(Vol.1), pp 143-158) **Impurity-driven rippling modes in tokamaks.** Rutherford, P.H. (Princeton Univ., USA). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Rippling modes arising from nonuniformities in Zsub(eff) in an impure tokamak plasma are analysed: instabilities are found even in the case of large electron thermal conduction along field lines. For typical parameters, modes up to high m-values are unstable. The resulting magnetic perturbations, although small, could provide a mechanism for significant anomalous cross-field thermal transport.

58833 (EUR—6584(Vol.1), pp 159-179) **Nonlinear behavior of tearing modes.** Biskamp, D. (EURATOM-IPP Association, Garching (Germany, F.R.)). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

This lecture deals with the nonlinear properties of individual tearing modes. First the purely resistive case is considered. The nonlinear island growth is a slow diffusion process on the resistive skin time scale. The different effects determining the saturation island size are outlined. Tearing modes in a high temperature plasma are then discussed, where, in addition to resistivity, diamagnetic and viscous effects are important. Nonlinearly, however, these so-called drift tearing modes may behave quite similarly to purely resistive modes, since diamagnetic effects are quenched at a certain island size depending on the rate of cross-field plasma diffusion.

58834 (EUR—6584(Vol.1), pp 181-202) **Disruptive processes in tokamaks.** Biskamp, D. (EURATOM-IPP Association, Garching (Germany, F.R.)). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

This lecture reviews the theory of disruptive processes in tokamaks and similar devices, with particular emphasis on the internal $m=1$ disruption and the major $m=2$ disruption.

58835 (EUR—6584(Vol.1), pp 203-223) **What is the minimum value of the safety factor on the magnetic axis.** Bussac, M.N.; Pellat, R. (Ecole Polytechnique, Palaiseau, France); Edery, D.; Soule, J.L. (Association EURATOM-CEA, Fontenay-aux-Roses, France). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

This paper is presented in the following way: in chapter 2 the main stability properties in the vicinity of the magnetic axis with respect to the localized modes is recalled. The possibility of decreasing the minimum value of the safety factor q below unity, without violating Mercier's criterion is emphasized. In chapter 3 the ideal internal kink in cylindrical geometry for non-circular cross-sections is studied. The main findings are the small destabilizing effect of an elliptical deformation and the larger stabilizing effect of a triangular deformation. In chapter 4 the previous analysis is completed by toroidal corrections and the complete result for the ideal internal kink for circular magnetic surfaces is given. This mode may be stable in toroidal geometry provided the minimum value of q remains larger than 1/2. In chapter 5 the resistive internal kink and its collisionless high temperature limit is discussed. Toroidal effects and non-linear effects in the non-linear development of the tearing modes are compared.

58836 (EUR—6584(Vol.1), pp 225-235) **Magnetohydrodynamic equilibria.** Nelson, D.B. (Office of Fusion Energy, Washington, USA). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

MHD equilibria are reviewed, with emphasis on axisymmetric toroidal geometry. Effects of finite aspect ratio, finite β, and noncircular cross section are discussed. Required external confining fields are described, including those needed for cross section shaping. Transport and other time-dependent effects on equilibria are introduced, including the concepts of flux conserving tokamaks and resistive time equilibria.

58837 (EUR—6584(Vol.1), pp 237-269) **α-particles in tokamaks.** Pfirsch, D. (EURATOM-IPP Association, Garching (Germany, F.R.)). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

This talk covers the following topics: 1) generation of α-particles; 2) direct loss of α-particles, ripple effects; 3) losses during and after slow down of α-particles, transport code calculations, thermal instability, burning times; 4) ripple induced losses; 5) contribution of α-particles to the total pressure.

58838 (EUR—6584(Vol.1), pp 271-288) **Velocity space instabilities of alpha particles in tokamak reactors.** Sigmar, D.J. (Oak Ridge National Laboratory, USA). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Of all species comprising the fusion plasma, the alpha particles have the strongest deviation from thermodynamic equilibrium, in configuration space as well as in velocity space. Under typical circumstances (main plasma density and temperature profile somewhat peaked and startup of the fusion burn not slower than an energy confinement time), the ensuing alpha gradients will lead to a low frequency drift-Alfven wave instability and the hollow alpha velocity distribution will lead to a high frequency compressional Alfven wave instability. This lecture will address the conditions for the linear theory and the anomalous relaxation of the velocity space instability of isotropic alpha distribution functions.

58839 (EUR—6584(Vol.1), pp 291-311) **Ignition with lower hybrid heating.** Brambilla, M. (Association EURATOM-CEA, Grenoble (France)). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

The feasibility of heating a large Tokamak plasma to ignition using Lower Hybrid waves is discussed. It is found that simple linear theory of coupling and absorption determines the frequency choice and the antenna design rather precisely. It also sets an upper limit to the plasma β at ignition which can be obtained with this method; it turns out to be compatible with reactor economic requirements. However, if non-linear scattering and absorption were to make the plasma considerably more opaque to LH waves than predicted by linear theory, ignition by LH heating might become impossible.

58840 (EUR—6584(Vol.1), pp 313-314) **Very low frequency plasma heating.** Canobbio, E. (Association EURATOM-CEA, Grenoble, France). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

58841 (EUR—6584(Vol.1), pp 315-337) **Electron cyclotron resonance heating of high temperature plasmas.** Antonsen, T.M. Jr.; Porkolab, M. (Massachusets Institute of Technology, USA). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

The heating of high temperature, magnetically confined plasma with electromagnetic radiation in the electron cyclotron frequency range is considered. An outline of the linear theory of propagation and absorption of electromagnetic waves is presented, and formulas for the absorption of the ordinary and extraordinary modes in an inhomogeneous magnetic field are given. Recent experimental results are outlined and the extension of current results to thermonuclear plasmas is discussed.

58842 (EUR—6584(Vol.1), pp 339-354) **Global properties of ohmically heated reversed-field pinches.** Gerwin, R.A. (Los Alamos Scientific Laboratory, USA). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

The simultaneous requirements of power balance and pressure balance have been considered. The treatment generalizes the Pease-Braginskii pinch current limit by including toroidal magnetic field, anomalous resistivity, nonradiative losses, and time-dependent fields. The rise of the temperature to a state of power balance proves to be amenable to a very simple and unified description. Finally, the practical parameter windows implied by the joint action of power balance and pressure balance are displayed.

58843 (EUR—6584(Vol.1), pp 355-358) **Compressional heating.** Duechs, D. (EURATOM-IPP Association, Garching, Germany, F.R.). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

58844 (EUR—6584(Vol.1), pp 359-371) **Neutral injection heating of toroidal plasma to ignition.** Cordey, J.G. 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

The basic theory of the neutral injection heating of a toroidal plasma is presented. This consists of the deposition of the fast ions, their energy loss, scattering and radial diffusion, followed by the effect of this method of heating on the plasma temperature, current and rotation, and the production of α particles. Special emphasis will be placed on problem areas which may prevent ignition being achieved. In particular the subject of the injection energy and power level required to reach ignition with different scaling laws will be discussed.

58845 (EUR—6584(Vol.1), pp 373-392) **Energy deposition profiles in fast neutral injection experiments.** Dei-Cas, R. (Association EURATOM-CEA, Fontenay-aux-Roses, France). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

A Monte Carlo code has been developed to calculate the beam energy deposition profile in real geometry experiments including the ripple trapping effects. The computation time has been drastically reduced by using an acceleration process which conserves the physical aspects. Applications will be given for TFR and an ignitor-like experiment.

58846 (EUR—6584(Vol.1), pp 395-410) **Radiation in thermonuclear regime.** Griem, H.R. (University of Maryland, USA). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Processes to be considered in addition to the irreducible electron-(D or T) ion bremsstrahlung are line radiation from incompletely stripped impurity ions, recombination radiation and bremsstrahlung on these ions and higher harmonics of the electron cyclotron radiation. The impurity radiation processes depend strongly on the charge state of the ions which is, besides by transport, usually controlled by electron impact ionization and electron capture with excitation (dielectronic recombination). Rate coefficients for these processes and for electron impact excitation of line radiation are estimated and basic formulas for bremsstrahlung, recombination radiation, and cyclotron harmonic emission are reviewed. Comparison is made with rate coefficients used in calculations of impurity radiation from plasmas for which corona equilibrium can be assumed.

58847 (EUR—6584(Vol.1), pp 411-418) **2.g. ionization, recombination and radiation barriers.** Griem, H.R. (University of Maryland, USA). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Because of the intense line radiation from low ionization stages of a given element, it is important that ionization is rapid and effective even at relatively low electron densities, i.e., occurs relatively early in the discharge and reasonably close to the boundary. These requirements lead for given electron impact ionization rates to upper bounds on impurity fluxes from the wall. Assuming these bounds will not be exceeded in future devices, it is then possible to estimate permissible impurity concentrations from stationary solutions of the ionization-recombination balance and impurity transport equations. In the interior of the plasma, the concentration should be small enough that the radiative power density remains at a fraction of the deposited α-particle power. Enhanced recombination, e.g., by charge transfer with injected neutrals, may lead to more stringent conditions for plasma purity.

58848 (EUR—6584(Vol.1), pp 455-457) **Computer models for fusion plasmas.** Duechs, D. (EURATOM-IPP Association, Garching, Germany, F.R.). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

58849 (EUR—6584(Vol.1), pp 459-473) **Mathematical and technical problems involved in codes for plasmas in toroidal devices.** Taroni, A. (CNEN, Bologna (Italy)). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

This lecture presents a survey of mathematical and technical problems connected with the development of codes for the study of plasmas confined in toroidal devices. Some currently used numerical methods are explained; difficulties and limitations due to the finite capability of the available computers are pointed out.

58850 **(EUR—6584-Vol.1) Physics of plasmas close to thermonuclear conditions: proceedings.** Coppi, B.; Leotta, G.G.; Pfirsch, D.; Pozzoli, R.; Sindoni, E. (eds.). (Commission of the European Communities, Brussels (Belgium)). 1979. 489p. (CONF-790866—Vol.1). NTIS (US Sales Only), PC A21/MF A01. Order Number DE82780712.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Separate abstracts for each paper were entered into the data base. (MOW)

58851 (EUR—6584(Vol.2), pp 479-499) **Plasma thermal energy transport: theory and experiments.** Coppi, B. (Massachusetts Institute of Technology, USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Experiments on the transport across the magnetic field of electron thermal energy are reviewed (Alcator, Frascati Torus). In order to explain the experimental results, a transport model is described that reconfirmed the need to have an expression for the local diffusion coefficient with a negative exponent of the electron temperature.

58852 (EUR—6584(Vol.2), pp 571-586) **Fast wave heating in the Princeton Large Torus.** Hosea, J.; Arunasalam, V.; Bernabei, S. (Princeton University, USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Fast wave heating in the ion cyclotron range of frequencies (ICRF) is being studied on the Princeton Large Torus (PLT) to evaluate its potential for heating large reactor-scale toroidal plasmas. Of primary interest are the two-ion and pure second harmonic heating regimes which, with proper control of the ion energy distribution and the rf power deposition profile, permit substantial energy flow into the bulk plasma ions. Initial heating experiments have been conducted with a single 1/2 turn antenna up to wave powers of P(rf) approximately= 350 kW for durations of > or approximately 100 ms in the two-ion regime under conditions for which direct fundamental cyclotron damping on the minority ion species dominates the wave absorption. Ion-ion coupling serves to heat the majority ions and for energetic minority ion energy distributions, energy flow to the electrons results from electron drag. Substantial ion heating is found for D-p mixtures; $\Delta T(d)(0)$ approximately 600 eV for 350 kW with nsub(e) approximately 2 x 10^{13} cm^{-3}. The deuteron heating efficiency is improved by about a factor of approximately 2 in $D^{-3}He$ mixtures; $\Delta T(d)(0)$ approximately 500 eV for 150kW with nsub(e) approximately 2.1 x 10^{13} cm^{-3}.

58853 (EUR—6584(Vol.2), pp 587-615) **Experimental results from present-day high field tokamaks.** Pieroni, L. (Associazione EURATOM-CNEN sulla Fusione, Centro di Frascati, Italy). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

The aims and scientific motivations of high magnetic field Tokamaks at the begining of the world-wide effort on toroidal diffused pinches are recalled. They are compared with the experimental results obtained in actual machines like ALCATOR-A at MIT and FT at CNEN in Frascati. The importance of these results with regard to the goal of nuclear fusion is emphasized, especially considering the high density regimes achieved and the phenomenological scaling laws derived from them.

58854 (EUR—6584(Vol.2), pp 617-632) **Preliminary results of noncircular plasma experiments in Doublet III.** Ohkawa, T. (General Atomic Company, San Diego, CA, USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Preliminary results of noncircular plasma experiments in Doublet III are reported. Shaping and discharge characteristics in doublet plasma with high-Z limiters are described. Electron energy confinement and maximum plasma density are in agreement with standard circular tokamak empirical scaling laws. Chromium and molybdenum appear to be the dominant high-Z contaminants while carbon appears to dominate low-Z contaminants. High-Z impurity radiation does not appear to dominate the central power balance.

58855 (EUR—6584(Vol.2), pp 659-677) **Magnetic mirror confinement of high-energy, high-density plasma.** Coensgen, F.H.; Simonen, T.C. (University of California, Livermore, USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

This paper summarizes results obtained from and work in progress on those experiments which have contributed significantly toward the confinement in single-cell magnetic mirror systems of plasmas close to thermonuclear conditions. Because the mirror confinement of such high-energy, high-density plasmas has been studied most extensively in the 2XIIB experiment, discussion of 2XIIB results forms a major portion of this paper. In these experiments, injection of low-energy plasma has been shown to suppress microinstabilities to sufficiently low levels that high-beta (β approximately 1) plasmas could be achieved and sustained by cross-field injection of beams of neutral particles. Plasma confinement was found to improve with ion energy, electron temperature, and plasma size. Based on these results, a large Mirror Fusion Test Facility (MFTF) was designed to pursue confinement scaling to higher energies and larger plasma dimensions. MFTF design parameters and construction status are briefly reviewed.

58856 (EUR—6584(Vol.2), pp 749-775) **Steps toward increasing Q in mirror systems.** Post, R.F. (University of California, Livermore, USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Experiments such as the 2XIIB experiment at Livermore have established the ability of mirror systems to confine high temperature, high density plasmas at central beta values exceeding unity. Given these results the next tasks for the mirror aproach are to explore means for increasing the energy gain factor Q and to scale up the plasma volume, both of these requirements deriving from economic constraints. This report will discuss means for incresing Q, including recent improvements in the tandem mirror concept and design studies of the field-reversed mirror in the context of upcoming and proposed scaled-up mirror experiments.

58857 **(EUR—6584-Vol.2) Physics of plasmas close to thermonuclear conditions: proceedings.** Coppi, B.; Leotta, G.G.; Pfirsch, D.; Pozzoli, R.; Sindoni, E. (eds.). (Commission of the European Communities, Brussels (Belgium)). 1979. 404p. (CONF-790866—Vol.2). NTIS (US Sales Only), PC A18/MF A01. Order Number DE82780713.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Separate abstracts for each paper were entered into the data base. (MOW)

58858 **(EUR-CEA-FC—1083) Comments on ideal ballooning.** Dagazian, R.Y.; Paris, R.B. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Groupe de Recherches sur la Fusion Controlee). Sep 1981. 24p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701974.

Ideal ballooning modes are investigated for the case of plane magnetized slab geometry.Toroidal effects are simulated by a gravitational acceleration periodically varying along magnetic field lines. High shear is shown to be very effective in stabilizing these modes even when field line curvature is most unfavorable to their stability.

58859 **(EUR-CEA-FC—1117) Parametric instabilities in an electron beam-plasma system: magnetic field effects.** Gell, Y.; Levush, B.; Nakach, R. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Grenoble, 38 (France). Dept. de Recherches sur la Fusion Controlee). Sep 1981. 32p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82701976.

The effects of a magnetic field on the excitation of low-frequency parametric instabilities in a beam-plasma system are considered. The dispersion relation of the three-dimensional beamless configuration, is analytically evaluated for an electrostatic pump wave having a finite wave-vector parallel to the magnetic field. The results of this analysis serve as a guide to the numerical study of the stability of the involved system including the beam. As for the one-dimensional case, one finds that two low-frequency electrostatic instability branches having different growth rates may exist simultaneously. The effects of the magnetic field on these instabilities could be summarized as follows: the small growth rate instability is negligibly small when the electron gyrofrequency is about equal to the pump wave frequency. This instability is magnetic field independent for high enough values of the field. When the plasma electron Debye length is greater than the beam electron Debye length, a large growth rate instability is excited and appears to be weakly dependent on the magnetic field, while the two instability branches are quite sensitive to change of the magnetic field, when the two Debye lengths are equal. Other characteristics of this system are also discussed.

58860 **(EUR-CEA-FC—1125) Asymptotic behavior of certain solutions of Benard convection two-dimensional problems.** Saramito, B. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Groupe de Recherches sur la Fusion Controlee). Sep 1981. 24p. (In French). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701977.

In connection with a digital study of convective movements in a cylindrical layer of plasma, it became necessary to explicit certain results relating to the bi-dimensional problem of Rayleigh-Benard convection. For the coupled system of Navier-Stokes equations and the heat transport equation, consideration is given to "free" type boundary conditions for the velocity on both horizontal planes which limit the plane layer of fluid studied. Asymptotic increases (for very great times) of the single solution of this problem are then obtained, using a formulation by means of velocity current function. These increases then enable a study to be made analogous to that which C. Foias and G. Prodi (1967) made for the Navier-Stokes equation with "rigid" type boundary conditions for the velocity (V vector= 0 on the edge): a sufficient condition is then obtained for the asymptotic behaviour of certain classes of solutions of the problem to be correctly described by that of the projection of these solutions over a finite dimension space. This conditions is expressed as a criterion linking the dimension of this space to the Rayleigh R number, with an almost linear dependence in R.

58861 **(EUR-CEA-FC—1127) Slowing-down of fast ions in a Tokamak plasma. 1. Theoretical part.** Mercier, C.; Capes, H.; Morera, J.P. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Groupe de Recherches sur la Fusion Controlee). Oct 1981. 61p. (In French). NTIS (US Sales Only), PC A04/MF A01. Order Number DE82701978.

In the first part of this work, the equation of the change in the distribution function of fast particles, averaged out on the angular variable theta was explicited. It was shown that the resolution of this equation involves the prior determination of ten coefficients which depend on the invariants of the collision-free movement. In a second part, a study was made of the transformation of variables which makes it possible to pass from the usual variables of space and velocity (r, theta, P, v) to the variables defined by the invariants of the collision-free movement. In this new space the domain of resolution of the previous equation was determined as were also the associated boundary conditions. A very simple method is also given whereby, knowing the three invariants ν, lambda, v and additional variable sigma, the nature of the path and its characteristic points may be completely determined. With this information, it becomes possible to associate, at each point of the domain (ν, lambda, v, sigma) a value for each of the ten coefficients and then the determination of the distribution function of the fast particles can be undertaken.

58862 **(EUR-CEA-FC—1132) Variational equations of hydromagnetic equilibria.** Bineau, M. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Groupe de Recherches sur la Fusion Controlee). Oct 1981. 33p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82701979.

The structure of the variational equations of hydromagnetic equilibria is analyzed in this article. Some smooth equilibrium epsilon is assumed to be given. For reasons related to the method of approach epsilon has a tubular form (without magnetic axis) and its magnetic field is nearly a vacuum magnetic field. The variation is taken in a class of equilibria containing epsilon. This class is further defined by boundary conditions (in a broad sense). We seek solutions in a Hilbert space of functions with generalized derivatives. The solutions depend on the data of two functions of one variable (they represent physically the variations of the pressure and of the longitudinal current inside a flux surface). A uniqueness theorem is obtained for these data. It is completed by an existence theorem in case of axisymmetry and by a conditional non existence theorem otherwise.

58863 (FUPH-R—180) **Low power, long duration Rotamak discharges in argon.** Jessup, B.L.; Tendys, J. (Flinders Univ. of South Australia, Bedford Park. School of Physical Sciences). Feb 1982. 38p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82701980.

An investigation is made of a Rotamak compact torus configuration in which the rotating magnetic field used to drive the toroidal current is generated by a pulsed 6 KW R.F. oscillator. The toroidal current is measured together with the vertical component of the magnetic field both along the vertical axis and as a function of radius in the midplane of the current ring. The experimental results show that a Rotamak equilibrium, apparently stable for several milliseconds, could be obtained. Toroidal plasma currents of several hundred amps were observed with argon filling pressures around 0.2 mTorr and applied vertical equilibrium fields of about 1 m Tesla.

58864 (ILE—8011P) **Modified Thomson parabola ion spectrometer of wide dynamic range.** Sakabe, S.; Mochizuki, T.; Yamanaka, T.; Yamanaka, C. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 14 Jul 1980. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702505.

A modified Thomson parabola ion spectrometer of a wide dynamic range for studies of flash ion emitted from laser produced plasmas was developed. The exact velocity distributions of different ion species were obtained separately with sufficient velocity resolution.

58865 (INIS-mf—7064) **Wills Plasma Physics Department annual progress report 1981.** (Sydney Univ. (Australia). School of Physics). 1982. 22p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701981.

Progess is reported on research programs which are proceeding in the following areas: comissioning of the TORTUS research tokamak, plasma diagnostics, non-linear hydromagnetic waves and shock waves, and laser and gyrotron diagnostics.

58866 (IPPJ—505) **Study of effects of impurity ions and neutral atoms on reversed-field pinch by 2-D MHD pinch simulation.** Nagata, A.; Ashida, H.; Okamoto, M.; Hirano, Y.; Maejima, Y. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Feb 1981. 30p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82701984.

Two-dimensional MHD pinch simulation code, "TOPICS", which includes the effects of the impurity ions, the neutral atoms and anomalous resistivity, has been applied to the investigation of the RFP-plasmas at the setting-up phase of the TPE-lR. Simulations are compared with the typical two cases of the experiment: (a) the lower initial bias field and the higher plasma current density and (b) the higher initial bias field and the lower plasma current density. The magnetic field profiles at the setting-up phase in the experiments can be fairly well explained by the simulation assuming the 50% ionization degree of the initial plasma and the presence of 10% oxygen. It is also found from the simulation that the radiation loss due to 5 to 10% impurities is the dominant electron energy loss mechanism. The toroidal magnetic field profile at the setting-up phase calculated by using the isotropic anomalous resistivity is much narrower than that by the classical resistivity.

58867 (IPPJ—510) **Model equations for nonlinear time evolution of the dissipative trapped ion instability.** Hatayama, A.; Koshi, Y.; Ogasawara, M. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Mar 1981. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701986.

A set of model equations of the dissipative trapped ion instability is derived to confirm Saison, Wimmel and Sardei's infer that modification of the background trapped particle number density may be a possible saturation mechanism. Multiple time scale expansion scheme is applied to the nonlinear fluid equations of Kadomtsev and Pogutse by employing a usual ordering νsub(i) $<< \omega <<$ νsub(e), where νsub(j) is the effective collision frequency of j-th trapped particles and ω is the frequency of the instability. Model equations derived describe the time evolution of the modification of the background trapped particle number density and the amplitude of the dissipative trapped ion mode.

58868 (IPPJ—516) **Oscillation of the trapped flux in the early phase of a reversed field theta-pinch.** Wu, Ch.; Aso, Y.; Himeno, S.; Yamaguchi, S.; Hirano, K. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Apr 1981. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701987.

Magnetic probe measurements show that the flux trapped into the neutral sheet radius R sub(o) at the early phase of the reversed field theta-pinch does not decrease monotonously but oscillates. We proposed a model that the oscillation may be caused by the off-diagonal element of the ion pressure tensor P sub(r theta)sup(i) which may also drive the plasma rotation. The accuracy of probe measurement was confirmed to be less than 10% by using the excluded flux. The experimental data are compared with the results of one dimensional hybrid code. We found the agreement between the two is fairly good.

58869 (IPPJ—517) **Amount of impurity and its behavior in the STP-2 screw pinch tokamak.** Yamaguchi, S. (Nagoya Univ. (Japan). Inst. of Plasma Physics). May 1981. 35p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82701988.

Temporal and spatial evolution of oxygen spectral line intensities have been measured in the STP-2 screw pinch tokamak. The electron density and temperature as measured by Thomson scattering are of the order of 10^{14} cm^{-3} and 10 eV, respectively. On the basis of these measurements, quasi-steady-state rate equations have been solved to give the OII and OIII ion densities. It is found that the density of oxygen impurity is about several percent of the electron density, and the impurity moves with the bulk plasma. It is confirmed that the impurity originates from the wall of the discharge tube during the initial phase of the discharge.

58870 (IPPJ—521) **Conducting liquid conveyer of plasma rings.** Tomita, Y.; Mohri, A. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Jun 1981. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701989.

Current-carrying plasma rings can be conveyed in a cylindrical channel with a conducting liquid flow to which outer poloidal fields of the rings freeze. Fast tilting motion of the ring is stabilized when the liquid surface is set close to the ring within a critical distance. Effects of a resistive tube duct installed for the liquid are also examined.

58871 (IPPJ—522) **Plasma confinement in ECH bumpy torus.** Fujiwara, M.; Hosokawa, M.; Iguchi, H.; Ikegami, H.; Kamimura, T. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Jun 1981. 28p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82701990.

Theoretical and experimental researches are reviewed on plasma confinement in ECH bumpy torus. Numerical study on particle confinement found that the particle confinement by vaccum magnetic field is the combination of toroidal and mirror-like trap depending strongly on spatial position. The ambipolar potential improves confinement greatly and the critical energy of confined particles W is up to epsilon sub(t)sup(-1)(e phi) (here epsilon sub(t) and phi are the inverse aspect ratio and plasma potential well or hill), while W -- e phi in tandem mirror configuration. Some useful suggestions are given to conventional neoclassical transport theory. Experimental results are also surveyed, especially focused on the scaling laws of the toroidal core plasma and hot electron ring parameters. The formation of hot electron rings is possible under some special conditions where ECH heating overcome the Coulomb drag cooling by background plasmas. In other words this condition determines the maximum density of toroidal core plasma. Attainable beta value or stored energy of hot electron rings is summarized by using experimental data of various machines. Brief report is presented on recent experiments of ICH in NBT device. ICH not only contributes to ion heating, but affects the plasma potential which has an important effect on transport. Some results are also reported with respect to theoretical analysis of stability and equilibrium.

58872 (IPPJ—523) Edge cooling of hot plasma with the help of radio frequency wave. Ikuta, K.; Hatori, T. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Jun 1981. 13p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701991.

An effect of the RF potential to the trapped particles in tokamaks is considered in detail. And the behavior of impurity derived from the RF potential can be applicable to the edge cooling of hot plasma using the radiation loss from the concentrated impurities in the plasma periphery.

58873 (IPPJ—536) Electromagnetic cyclotron harmonic waves. Ohnuma, T.; Watanabe, T.; Hamamatsu, K. (Nagoya Univ. (Japan)). Sep 1981. 15p. NTIS, PC A02/MF A01.

Electromagnetic electron cyclotron harmonic waves just below the electron cyclotron harmonics were investigated numerically and experimentally. Backward waves which were observed to propagate nearly perpendicular to the magnetic field just below the electron cyclotron frequency in a high density magnetoplasma were confirmed to be in accord with the theoretical electromagnetic cyclotron waves.

58874 (IPPJ—543) Numerical study on the interaction between a modulated electron beam and a plasma. Fukumasa, O.; Itatani, R. (Nagoya Univ. (Japan)). Sep 1981. 48p. NTIS, PC A03/MF A01.

Interaction of a modulated electron beam with a plasma is calculated for unbounded and bounded electron beam-plasma systems, using the method of partial simulation. In the case of the unbounded system, deformation of the beam distribution function is occurred in relation to suppression of one wave by the other wave. While, in the case of the bounded system, occurrence of deformation depends on whether feedback effects of reflected beams are present or not. The findings are qualitatively in agreement with experimental results.

58875 (IPPJ—544) Oxygen transport and line emissions in a tokamak plasma. Kato, T.; Kako, M.; Amano, T.; Nomura, Y.; Hayakawa, S. (Nagoya Univ. (Japan)). Sep 1981. 34p. NTIS, PC A03/MF A01.

Two models which describe the behavior of impurity in tokamaks are investigated: one is the drift model and the other the diffusion model. The drift model is a simplified one in which impurity ions drift only inward, while the diffusion of impurities is taken into account in the diffusion model. The results of the two models are compared. Spectroscopic data on oxygen impurities in JIPP T-2 tokamaks are employed for comparison with the theoretical results in which metastable populations were considered to calculate the line intensities. Oxygen transport is well interpreted with the neutral influx of energy 10 to 50 eV and anomalous diffusion of magnetic 5000 (n sub max/n sub e(r)) sq cm/sec.

58876 (IPPJ—545) Toroidal plasma current sustainment by lower hybrid waves in the WT-2 tokamak. Nakamura, M.; Cho, T.; Kubo, S.; Shimozuma, T.; Kawai, H.; Yamazaki, Y.; Maekawa, T.; Terumichi, Y.; Tanaka, S.; Hamada, Y. (Nagoya Univ. (Japan); Kyoto Univ. (Japan)). Oct 1981. 16p. NTIS, PC A02/MF A01.

Injecting RF power P sub RF near the lower hybrid frequency into an Ohmic heating plasma near the end of Tokamak discharge in the WT-2, and RF driven current sustained plasma is produced and continued to exist during the rf injection period, where the toroidal current (T sub p approximately 10 kA) is generated by the lower hybrid wave only without the Ohmic power. The efficiency of RF driven current generation is high and attains to I sub/P sub RF approximately 0.9 kA/kW.

58877 (IPPJ—546) Energy and momentum deposition to plasmas due to the lower hybrid wave by a finite source. Nakajima, N.; Abe, H.; Itatani, R. (Nagoya Univ. (Japan)). Oct 1981. 68p. NTIS, PC A04/MF A01.

Heating and current generation due to the lower hybrid wave are studied using particle simulation. A propagation cone consisting of Fourier expanded modes is emphasized. The trajectory of the propagation cone is well described up to the lower hybrid resonance layer using both cold plasma approximation and the Wentzel-Kramer-Brillouin method. An ion cross field drift due to the ponderomotive force is observed. The modes in the higher side of the spectrum of the antenna play a key role for creation of the ion high energy tail. This process is called the cascade process judging from the time variation of the damping of each mode. The particle model is significantly improved using the elongated grid and the quadric spatial interpolation.

58878 (IPPJ—547) Soft and hard major disruptions in the profile control experiment of the JIPP T-2 tokamak. Toi, K.; Sakurai, K.; Tanahashi, S.; Yasue, S. (Nagoya Univ. (Japan)). Sep 1981. 43p. NTIS, PC A03/MF A01.

The nonlinear saturation theory of tearing modes is applied to the tokamak plasmas produced by an appropriate combination of gas puffing and plasma current-rise in JIPP T-2. The calculated relative amplitude of poloidal field fluctuations has good correlation with the experimental data. The radial extent of the island widths of m/n 2/1 and 3/2 modes which are derived in the calculation suggests that the soft major disruption, where a plasma current suffers only slight change, can be triggered by either the overlapping of 2/1 island with 3/2 one or the contact of 2/1 island with a limiter. Moreover, it is consistent with the experimental data the hard major disruption, which brings about the abrupt and significant reduction of the plasma curent, results from the combined process of two above-mentioned causes of the soft major disruption.

58879 (IPPJ-DT—79) Plasma heating. Various methods of supplementary heating. Sugihara, R.; Kaneko, O. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Feb 1981. 48p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82701994.

Plasma heating is one of the important problems of fusion reactor technology. It is known that ohmic heating is not sufficient to satisfy the Lawson condition. This paper reviews the supplementary heating methods for plasma. Neutral beam injection is one of the methods of supplementary heating. The neutral beam with high energy is ionized, confined and thermalized in plasma. The power balance of ions and that of electrons determine plasma temperature. The impurity ions in plasma are the cause of radiation loss. The experiment at PLT achieved successfully neutral beam injection heating, and the temperature of 5.5 keV was obtained. The radio frequency wave (RF) heating is another method. The ion cyclotron range of frequency (ICRF) heating, the lower hybrid resonance (LHR) heating, and the electron cyclotron resonance heating are the typical RF heating. The instruments for these heating methods are easily available, and the energy transmission into plasma core is easy. As other methods, the adiabatic compression heating is also described.

58880 (JAERI-M—9456) Electrostatic ballooning mode. Tuda, T.; Itoh, K.; Tokuda, S.; Itoh, S.I. (Japan Atomic Energy Research Inst., Tokyo). Apr 1981. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701998.

Numerical solution of high-n electrostatic ballooning mode is obtained without approximations. We keep correct forms of electron and ion responses to the wave. We find instabilities which arise due to toroidal effects. The dependences on the aspect ratio, magnetic shear, and wave length are also studied. The growth rate γ is large and satisfies the relation $\omega < \gamma$ -- ω sub(*). Depending on the parameters the real frequency ω changes its sign. The drift mode, which has been found stable in a slab plasma, persists in the toroidal plasma remaining almost always stable. The density fluctuations in tokamaks, which have been observed by use of the microwave scattering method, can be qualitatively explained by the theory of the electrostatic ballooning mode.

58881 **(JAERI-M—9589) High density low-q discharges with D-shaped plasmas in Doublet III.** Nagami, M.; Yoshida, H.; Shinya, K.; Yokomizo, H.; Shimada, M.; Ioki, K.; Izumi, S.; Kitsunezaki, M.; Jahns, G. (Japan Atomic Energy Research Inst., Tokyo). Jul 1981. 43p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702003.

The maximum plasma current in Doublet III is found to be limited by disruptions when the limiter safety factor is approximately 2. However, due to the strong toroidal and shaping field effect on rotational transform at the outer plasma edge associated with a D-shape formation having a vertical elongation of 1.5, the safety factor q sub(a) * estimated from simple geometric considerations for D-shaped plasmas corresponds to values as low as 1.5. These discharges operate stably with considerably higher plasma current than most reactor design studies assume. These low-q discharges show excellent plasma performance: very flat spatial electron temperature progiles, high density operation with anti n sub(e)R/B sub(T) up to 7.8, and good energy confinement producing a volume average β of up to 1% with ohmic heating only. This operational regime appears to be applicable to future high β tokamaks with D-shaped cross section.

58882 **(KFTI—81-35) Dynamics of high turbulence of highly-hydrid waves in inhomogeneous electric field.** Brazhnik, V.A.; Grishaev, V.I.; Demchenko, V.V.; Omel'chenko, A.Ya.; Pavlov, S.S.; Panchenko, V.I. (AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.). 1981. 22p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702004.

Turbulization of homogeneous magneta active plasma under the effect of an inhomogeneous alternating electric field is studied in the hydrodynamic approximation. The process of parametric excitation of highly-hybrid waves in the weak and strong-coupling wave modes is analytically studied. It is shown that pumping wave inhomogeneity favours localization of plasma waves resulting in the absolute character of parametric instability developed in plasma. Numerical simulation permitted to find out that saturation of absolute parametric instabilities has a strong turbulent nature, the basis of which is generation of high-hybrid solitons by the ponderomotive force effecting plasma and caused by the electric field of instable waves. The relaxation character of soliton generation is explained as following: in the course of time solitons interact with each other in a complex way that leads to increasing the multiplicity of soliton formations.

58883 **(KFTI—81-36) Kinetics of neutral atoms in thermonuclear devices.** Besedin, N.T.; Marushchenko, N.B.; Pyatov, V.N. (AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.). 1981. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702005.

A system of integral equations for the density of neutral atoms and their energy is numerically solved. The Maxwell and monoenergetic plasma ion distributions are calculated with regard to diffusive and ideal atom reflection from the wall, using the experimentally obtained ionization cross sections, charge exchange, recombination and the reflection coefficient. It follows from the calculations that in contrast to the neutral atom energy their density distribution weakly depends on the type of the ion distribution function. Using the measured plasma density and temperature distributions, the peculiarities of the neutral atom behaviour in discharge can be revealed. The solutions obtained for the basic equations permitted to determine the neutral atom flux on the wall, the carried out of the discharge energy, as well as using the experimentally measured coefficients of material sputtering, the amount of impurities appeared as a result of sputtering by atoms can be calculated.

58884 **(KFTI—81-43) Integral methods of plasma equilibrium calculation in TOKAMAK.** Kilovataya, T.G.; Pyatov, V.N. (AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.). 1981. 27p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702511.

The method of numerical simulation on the basis of integral equations of quasistationary axial-symmetric plasma with a current of an arbitrary cross section is considered in the MHD approximation. The effect of different perturbation factors (ferromagnetic screens, external stationary currents) on parameters of the magnetic configuration is taken into account. The mathematical algorithms permitting to take into account optimizations while choosing the system of control of plasma filament location are constructed.

58885 **(LA-UR—82-2147) Compact toroidal plasmas: simulations and theory.** Harned, D.S. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 9p. (CONF-820930—4). NTIS, PC A02/MF A01. Order Number DE82018107.

From 9. international conference on plasma physics and controlled nulcear fusion research; Baltimore, MD, USA (1 Sep 1982).

Realistic FRC equilibria are calculated and their stability to the n = 1 tilting mode is studied. Excluding kinetic effects, configurations ranging from elliptical to racetrack are unstable. Particle simulations of FRCs show that particle loss on open field lines can cause sufficient plasma rotation to drive the n = 2 rotational instability. The allowed frequencies of the shear Alfven wave are calculated for use in heating of spheromaks. An expanded spheromak is introduced and its stability properties are studied. Transport calculations of CTs are described. A power balance model shows that many features of gun generated CT plasmas can be explained by the dominance of impurity radiation. It is shown how the Taylor relaxation theory, applied to gun generated CT plasmas, leads to the possibility of steady state current drive. Lastly, applications of accelerated CTs are considered.

58886 **(LA-UR—82-2262) Simulation of plasma double-layer structures.** Borovsky, J.E.; Joyce, G. (Los Alamos National Lab., NM (USA); Naval Research Lab., Washington, DC (USA)). 1982. Contract W-7405-ENG-36. 7p. (CONF-8205113—1). NTIS, PC A02/MF A01. Order Number DE82019536.

From Symposium on plasma double layers; Roskilde, Denmark (1 May 1982).

Electrostatic plasma double layers are numerically simulated by means of a magnetized 2 1/2-dimensional particle-in-cell method. The investigation of planar double layers indicates that these one-dimensional potential structures are susceptible to periodic disruption by instabilities in the low-potential plasmas. Only a slight increase in the double-layer thickness with an increase in its obliqueness to the magnetic field is observed. Weak magnetization results in the double-layer electric-field alignment of accelerated particles and strong magnetization results in their magnetic-field alignment. The numerial simulations of spatially periodic two-dimensional double layers also exhibit cyclical instability. A morphological invariance in two-dimensional double layers with respect to the degree of magnetization implies that the potential structures scale with Debye lengths rather than with gyroradii. Electron-beam excited electrostatic electron-cyclotron waves and (ion-beam driven) solitary waves are present in the plasmas adjacent to the double layers.

58887 **(LRP—176/80) Ideal MHD stability of oblate spheromaks and β optimization.** Gautier, P.; Gruber, R.; Troyon, F. (Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland); SEE CODE- 9100585 Ecole Normale Superieure, 91 - Orsay (France). Lab. de l'Accelerateur Lineaire). Dec 1980. 45p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82903472.

Portions of document are illegible.

An oblate spheromak surrounded by a conducting shell can stably confine a plasma with non-vanishing pressure. Using the ERATO code we find that whenever q/sub axis reversible 1 an internal kink develops, while for q/sub axis/ < 1 the Mercier criterion limits the β value. This leads to a β limit which inceases with the aspect ratio. For an aspect ratio of 2.4, equilibria with β reversible 40% have been found which are stable to both low-n and high-n modes. Withut a shell these equilibria are unstable; the fastest growing mode being a n = 1 tilting motion. A shell at a distance of the order of 0.2 to 0.4 the minor plasma radius stabilizes the low-n modes.

58888 (PPPL—1899) Identification of magnetic dipole lines above 2000 A in several Mo and Zr ions on the PLT tokamak. Suckewer, S.; Hinnov, E.; Cohen, S.; Finkenthal, M.; Sato, K. (Princeton Univ., NJ (USA). Plasma Physics Lab.). May 1982. Contract AC02-76CH03073. 12p. NTIS, PC A02/MF A01. Order Number DE82014865.

A number of spectrum lines arising from magnetic dipole transitions in the n = 3 shell ground configurations of molybdenum and zirconium ions have been identified. These lines are particularly suitable for spectroscopic diagnostics in tokamak-type plasmas in the 500 to 1500 eV temperature range.

58889 (PPPL—1915) Plasma transport in stochastic magnetic fields. III. Kinetics of test-particle diffusion. Krommes, J.A.; Oberman, C.; Kleva, R.G. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Jul 1982. Contract AC02-76CH03073. 67p. NTIS, PC A04/MF A01. Order Number DE82020259.

A discussion is given of test particle transport in the presence of specified stochastic magnetic fields, with particular emphasis on the collisional limit. Certain paradoxes and inconsistencies in the literature regarding the form of the scaling laws are resolved by carefully distinguishing a number of physically distinct correlation lengths, and thus by identifying several collisional subregimes. The common procedure of averaging the conventional fluid equations over the statistics of a random field is shown to fail in some important cases because of breakdown of the Chapman-Enskog ordering in the presence of a stochastic field component with short autocorrelation length. A modified perturbation theory is introduced which leads to a Kubo-like formula valid in all collisionality regimes. The direct-interaction approximation is shown to fail in the interesting limit in which the orbit exponentiation length L/sub K/ appears explicitly. A higher order renormalized kinetic theory in which L/sub K/ appears naturally is discussed and used to rederive more systematically the results of the heuristic scaling arguments.

58890 (Rijnhuizen—81-134) Equilibrium studies of skin-like pressure and current-density profiles. Kolfschoten, A.W. (Stichting voor Fundamenteel Onderzoek der Materie, Jutphaas (Netherlands). Inst. voor Plasma-Fysica). Sep 1981. 52p. NTIS (US Sales Only), PC A04/MF A01.

During the last few years considerable attention has been devoted to the study of turbulent heating as a heating method for large plasma volumes. In TORTUR - and other related experiments - the application of a heating pulse leads to anomalous heating without macroscopic plasma deformation. Immediately after the heating pulse is applied, the discharge is usually characterized by hollow pressure and current profiles that at the end of the pulse have filled up and have evolved into normal tokamak-like parabolic profiles. Since the plasma properties are such that, even on the μs timescale, MHD equilibrium can be established, we investigated the properties of a class of MHD equilibria that give rise to such characteristic pressure and current profiles. For this investigation a computer code for toroidal ideal MHD equilibria was rewritten and improved. The improvement of the code consists in employing a Moebius transformation, which maps the plane of the cross-section onto a plane in which the magnetic axis coincides with the origin of the coordinate system. This results in a code that can easily handle concave pressure and current profiles. The profiles obtained by means of this code show good agreement with the experimentally measured ones. The use of the mapping has resulted in a code with an improvement of convergence for high-beta cases.

58891 (Rijnhuizen—81-135) Influence of impurities on the discharge behaviour in SPICA. van der Meer, A.F.G. (Stichting voor Fundamenteel Onderzoek der Materie, Jutphaas (Netherlands). Inst. voor Plasma-Fysica). Oct 1981. 67p. NTIS (US Sales Only), PC A04/MF A01.

Discharges in the screw pinch SPICA can be produced in a small range of filling pressures and bias field values. The experimentally observed lower limit of 6 mtorr for the filling pressure is explained by the onset of MHD instabilities and by imperfect implosion at low values of the filling pressure at high values of the bias field. In the accessible parameter regime, discharges can be produced with densities of the order of 5×10^{21} m^{-3} and temperatures between 30 and 80 eV, which show gross stability for 200 μs, albeit not reproducible. In this density and temperature range discharges can easily become dominated by energy losses due to impurity radiation. An investigation of the temperature decay and the impurity concentration shows that, in spite of the quartz liner, this is not the case under normal operating conditions and that the energy containment time is of the order of 200 μs. The temperature decay rate, measured by means of Thomson scattering, is only 0.15 eV/μs, whereas from the intensity ratio of the 15.0 nm 2s ^2S - 3p $^2p^0$ and the 103.2 nm 2s ^2S - 2p $^2P^0$ OVI emission lines a decay rate of 0.3 eV/μs is derived. From absolute intensity measurements an oxygen concentration is derived. Besides oxygen, also silicon and nitrogen are present in the discharge. The nitrogen concentration that follows from absolute intensity measurements is in fair agreement with estimates based on an analysis of the background gas. The silicon concentration has not been measured directly, but it is estimated to be less than half the oxygen concentration since the wall material is quartz (SiO_2) and part of the oxygen originates from the background gas, mainly as a constituent of water vapour.

58892 (Rijnhuizen—81-136) Time-of-flight analysis of charge-exchange neutral particles from the TORTUR II plasma. Brocken, H.J.B.M. (Stichting voor Fundamenteel Onderzoek der Materie, Jutphaas (Netherlands). Inst. voor Plasma-Fysica). Oct 1981. 22p. NTIS (US Sales Only), PC A02/MF A01.

A disc chopper for time-of-flight analysis of fast neutral particles was constructed for the determination of the ion energy spectrum at lower energies than can be obtained by conventional electro-magnetic analyzers. The method has been applied to the TORTUR II tokamak. The chopper and detection system are described and the measurements are presented. For the interpretation of the results of the measurements a data analysis procedure was developed. The influence of reflections of neutrals at the liner wall showed to be important in the calculations of the neutral density profile at the plasma edge. The neutral energy spectrum in the lower energy range is strongly pronounced by this effect.

58893 (Rijnhuizen—81-137) Space- and time-resolved measurements of ion energy distributions by neutral beam injection in TORTUR II. Brocken, H.J.B.M. (Stichting voor Fundamenteel Onderzoek der Materie, Jutphaas (Netherlands). Inst. voor Plasma-Fysica). Oct 1981. 35p. NTIS (US Sales Only), PC A03/MF A01.

A method is described for the space- and time-resolved analysis of ion energy distributions in a plasma. A well-collimated neutral hydrogen beam is used to enhance the charge-exchange processes. The method is used in the TORTUR II tokamak to study the space and time evolution of the ion temperature profile of the plasma. The analytical background and the technique are described in detail. Examples of measurements on TORTUR II are presented.

58894 (STUDSVIK—81/2) Magnetic compression, non-adiabatic particle motion and intrinsic stochasticity. Persson, H. (Studsvik Energiteknik AB, Nykoeping (Sweden)). 23 Sep 1981. 13p. (CONF-810906—13). NTIS (US Sales Only), PC A02/MF A01.

From 10. European conference on controlled fusion and plasma physics; Moscow, USSR (14 Sep 1981).

Results from an ongoing study of magnetic compression of plasma and non-adiabatic particle motion are reported. A quasistationary model is adopted, with magnetically interacting, cylindrical sheets of particles, the motion of which and their mutual inductive coupling with the electromagnetic field are analysed. Phenomena like a discontinuous dependence of several quantities on canonical angular momentum around the value zero, and a magnetic energy inversion are found, as well as a transition from an integrable or near-integrable system for small value of the shielding capacity to stochastic behaviour for greater values of the latter. A particular two-sheet system exhibits apparently irregularly occurring transitions between an asymmetric mode with different oscillator frequencies and a symmetric one with frequency locking and strong interchange of energy and action, leading to a sawteeth variation of the latter. During the symmetric mode, nearby orbits in phase space diverge exponentially, with a KS-entropy corresponding to 1/8 of the gyro frequency in the external magnetic field.

58895 **(TRITA-PFU—81-05) Confinement and related transport in Extrap geometry.** Tendler, M. (Royal Inst. of Tech., Stockholm (Sweden). Plasma Physics and Fusion Research). Dec 1980. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702008.

The properties of the plasma equilibrium are investigated for the Extrap magnetic confinement geometry. An analytical solution for the profiles of the plasma parameters are found under the assumption that the energy is lost primarily in the radical direction by heat conduction and convection. An estimate of the radial particle confinement time is given, showing favorable scaling with plasma density and temperature. The conventional assumption of a uniform current density is shown to be unjustified in the case of an inhomogeneus electron temperature. An analytical expression is found for the pinch radius at different mechanisms of the heat transport.

58896 **(TRITA-PFU—82-01) Plasma balance equations based on orbit theory.** Lehnert, B. (Kungliga Tekniska Hoegskolan, Stockholm (Sweden). Institutionen foer Plasmafysik). Jan 1982. 35p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702513.

A set of plasma balance equations is proposed which is based on orbit theory and the particle distribution function, to provide means for theoretical analysis of a number of finite Larmor radius (FLR) phenomena without use of the Vlasov equation. Several important FLR effects originate from the inhomogeneity of an electric field in the plasma. The exact solution of a simple case shows that this inhomogeneity introduces fundamental changes in the physics of the particle motion. Thus, the periodic Larmor motion (gyration) is shifted in frequency and becomes elliptically polarized. Further, the non-periodic guiding-centre drift obtains additional components, part of which are accelerated such as to make the drift orbits intersect the equipotential surfaces of a static electric field. An attempt is finally made to classify the FLR effects, also with the purpose of identifying phenomena which have so far not been investigated.

58897 **(TRITA-PFU—82-03) Equilibrium and stability of a toroidal-sector plasma discharge in an EXTRAP configuration.** Drake, J.R. (Kungliga Tekniska Hoegskolan, Stockholm (Sweden). Institutionen foer Plasmafysik). Feb 1982. 27p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702515.

Experimental studies of the equilibrium and stability of a sector of a toroidal EXTRAP plasma discharge have been studied. The high β plasma discharge, which had an Alfven transit time about 0.5 μsec, could be positioned in a stable equilibrium for the 300μsec time scale of the experiment.

58898 **(TRITA-PFU—82-04) Discharge breakdown in the EXTRAP configuration.** Drake, J.R. (Kungliga Tekniska Hoegskolan, Stockholm (Sweden). Institutionen foer Plasmafysik). Feb 1982. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702498.

The breakdown of a discharge in a linear EXTRAP configuration has been studied experimentally. In this configuration the breakdown occurs along the zero B-field line, which is the axis of the linear octupole magnetic field, between the anode and cathode which constitute the ends of the linear device. Breakdown could be described by a modified Townsend criterion which included additional electron losses due to the presence of the B-field transverse to the discharge.

58899 **(UPTEC—8153-E) Impurity transport in a collision-dominated rotating tokamak plasma.** Eriksson, G.; Liljegren, A. (Uppsala Univ. (Sweden)). Apr 1981. 56p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE82702009.

The flux of heavy impurities is an axisymmetric, toroidal plasma with all particles in the collision-dominated regime is considered. Plasma rotation and charge-exchange with neutrals are taken into account. A hydrodynamic model employing Braginskii's transport equations is used. The therory is extended to higher collision freqencies as compared to previous treatments. It is found that the Pfirsch-Schlueter flux is significantly reduced as compared to the value given by Rutherford and that it is of the same order of magnitude, or less, than the classical flux in all regimes considered. It is also shown that the impurity flux can be influenced by charge-exchange with neutrals.

58900 **Observation of the parametric decay instability during electron cyclotron resonance heating on the Versator II tokamak.** McDermott, F.S.; Bekefi, G.; Hackett, K.E.; Levine, J.S.; Porkolab, M. (Plasma Fusion Center and Department of Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physics of Fluids;* **25**: No. 9, 1488-1490(Sep 1982).

Observations are reported on a nonlinear, three-wave interaction process occurring during high-power electron cyclotron heating in the Versator II tokamak. The measured spectra and the threshold power are consistent with a model in which the incident power in the extraordinary mode of polarization decays at the upper-hybrid resonance layer into a lower-hybrid wave and an electron Bernstein wave.

58901 **Instabilities driven by the parallel variation of the electrostatic potential in tandem mirrors.** Lee, X.S.; Catto, P.J.; Aamodt, R.E. (Plasma Research Institute, Science Applications Inc., Boulder Colorado 80302). *Physics of Fluids;* **25**: No. 9, 1491-1492(Sep 1982). Contract AC03-76ET53057.

It is demonstrated that the free energy associated with the sheared flow induced by the parallel variations of drift frequencies can provide a new destabilizing term. In particular, we show the existence of a magnetohydrodynamic-like instability which may occur in the mirror end plugs or thermal barrier region of a tandem mirror fusion device.

58902 **Effect of finite aspect ratio on the neoclassical ion thermal conductivity in the banana regime.** Chang, C.S.; Hinton, F.L. (General Atomic Company, San Diego, California 92138). *Physics of Fluids;* **25**: No. 9, 1493-1494(Sep 1982). Contract AT03-76ET51011.

By considering the effect of finite aspect ratio, the neoclassical ion thermal conductivity has been found to be significantly larger than reported by Hazeltine, Hinton, and Rosenbluth. A simple correction to the expression of Hinton and Hazeltine is suggested.

58903 **Ion acoustic double layers in the presence of plasma source.** Okuda, H.; Ashour-Abdalla, M. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **25**: No. 9, 1564-1569(Sep 1982). Contract AC02-76CH03073.

Steady-state plasma turbulence and the formation of negative potential spikes and double layers in the presence of ion acoustic instabilities have been studied by means of one-dimensional particle simulations in which the velocities of a small fraction of electrons are replaced by the initial drifting Maxwellian at a constant rate. A steady state is found where negative potential spikes appear randomly in space and time giving rise to an anomalous resistivity much greater than previously found. Comparisons of the simulation results with laboratory and space plasmas are discussed.

58904 **Numerical simulation of tokamak electron dynamics.** Miner, W.H.; Winsor, N.K.; Bernstein, I.B. (Science Applications, Inc., McLean, Virginia 22102). *Physics of Fluids;* **25**: No. 9, 1570-1577(Sep 1982). Contract AI01-76ET53020.

In a tokamak, the electron distribution deviates from a Maxwellian because magnetically untrapped electrons run away parallel to the applied electric field. A new method for calculating the dynamics of the electron distribution is presented. This method is novel because it can treat systems with comparable numbers of trapped and untrapped electrons, and an electric field comparable with (but smaller than) the Dreicer field. The electron distribution function and the plasma resistivity are presented for representative values.

58905 **Shear-ballooning stability analysis of low-β plasmas.** Yoshikawa, S. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Physics of Fluids;* **25**: No. 9, 1578-1582(Sep 1982). Contract AC02-76CH03073.

A model of magnetic configurations that has both shear and variation of the field curvature along the magnetic field is constructed. The stability analysis of this system is performed by expanding the perturbation function in phi$_0$ which is constant along the field and phi$_1$ which varies sinusoidally along the field line. The shear term is retained in the form of differential operations in ξ, the coordinate parallel to the pressure gradient. After several simplifications, the equation reduces to a fourth-order differential equation. The eigenvalue of this equation is obtained numerically. The calculated critical β plotted versus the well depth parameter, h, makes a smooth transition betweeen $h<0$ (maximum average B) and $h>0$ (minimum average B). Using the same technique, the nondivergent solution to the localized shear mode (Suydam mode) is also obtained by retaining the inertia term.

58906 **Decay instability of an ion-cyclotron wave in a plasma.** Sharma, O.P.; Tripathi, V.K.; Liu, C.S. (Department of Physics and Astronomy, University of Maryland, College Park, Maryland 20742). *Physics of Fluids;* **25**: No. 9, 1598-1604(Sep 1982).

An electromagnetic ion-cyclotron wave, near the second harmonic cyclotron frequency of majority ions in the central region of a tokamak, is seen to decay efficiently into two Bernstein modes. The coupling coefficient for this decay vanishes for a dipole pump, hence a rigorous kinetic theory for decay instabilities of a finite wavenumber pump is developed. For parameters characterizing the Princeton Large Torus (PLT) experiment, the uniform medium growth rate at 200 kW turns out to be 3 μsec, whereas, the threshold due to plasma inhomogeneity is 100 kW. The nonresonant decay into ion acoustic waves is also significant, though relatively less important. For a pump wave near the cyclotron frequency of majority ions, nonlinear Landau damping and oscillating two stream instability turn out to be very important.

58907 **Equilibrium and stability of nonaxisymmetric minimum-B mirrors.** D'Ippolito, D.A.; Freidberg, J.P. (Science Applications, Inc., Plasma Research Institute, Boulder, Colorado 80302). *Physics of Fluids;* **25**: No. 9, 1617-1627(Sep 1982). Contract AC03-76ET53057.

Analytic three-dimensional mirror equilibria are calculated from the tensor-pressure fluid equations by means of an asymptotic expansion procedure. The class of equilibria described here is of interest to the minimum-B end cells of current tandem mirror experiments. It is shown that in the shallow-well approximation, a small plasma pressure can produce a relative change of order unity in the vacuum magnetic well, thereby leading to interchange instability. In addition, if the axial dependence of the quadrupole field is not chosen in a specific way, "long thin" corrections set an upper limit on the maximum allowable plasma radius. The proper choice of quadrupole field to avoid this limitation is discussed, and an analytic expression is derived for the interchange beta limit.

58908 **Acceleration of multi-species ions in CO_2 laser-produced plasmas: Experiments and theory.** Begay, F.; Forslund, D.W. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physics of Fluids;* **25**: No. 9, 1675-1685(Sep 1982).

Experimental and theoretical results on the properties of CO_2 laser-induced carbon and polyethylene (CH_2) plasmas at laser intensities of $\sim 10^{15}$ W/cm^2 are presented. The Thomson parabola technique is used to measure the ion velocity distribution in the underdense expanding plasma which is collisionless and isothermal. A model which treats the problem of the collisionless expansion of an isothermal electrostatic multi-cold-ion quasineutral plasma will be used to interpret the experimental results. Experiments and theory show that the effect of hydrogen in the CH_2 target induces a cutoff in the carbon ion velocity distribution. Theory suggests that acceleration field attenuation effects modify the behavior of these plasmas. Data suggest that the space—time evolution of the ion velocity distribution is completed before an ionization-recombination equilibrium is reached. Experimental results from the underdense region are used to estimate plasma parameters near the critical surface, which show that the presence of hydrogen in the target apparently greatly reduces the thermal temperature near the critical surface, probably due to enhanced lateral energy transport.

58909 **Radio frequency current generation by waves in toroidal geometry.** Antonsen, T.M. Jr.; Chu, K.R. (Science Applications, Inc., McLean, Virginia 22102). *Physics of Fluids;* **25**: No. 8, 1295-1296(Aug 1982). Contract AI01-76ET53029.

The quasilinear generation of current by rf wave fields is investigated in toroidal geometry. A general expression is derived for the amount of current generated for a given wave-induced flux of particles. This expression should be of great practical value in assessing the various competing effects on current generation in toroidal geometry and is well-suited for implementation in a toroidal ray tracing code.

58910 **Generalized kinetic energy principle.** Van Dam, J.W.; Rosenbluth, M.N.; Lee, Y.C. (Institute for Fusion Studies, University of Texas, Austin, Texas 78712). *Physics of Fluids;* **25**: No. 8, 1349-1354(Aug 1982).

Using three single-particle adiabatic invariants, we derive an energy principle which generalizes that for the usual guiding center plasma in order to describe the low-frequency stability of a plasma containing an energetic nonhydromagnetic component (such as the annular electrons in an Elmo Bumpy Torus device).

58911 **Sufficient condition for stability of axisymmetric collisionless systems.** Walstead, A.E. (Physics Department, University of California at Los Angeles, Los Angeles, California 90024). *Physics of Fluids;* **25**: No. 8, 1358-1364(Aug 1982). Contract AM03-76SF00010.

A sufficient condition for the stability of an axisymmetric mirror machine is obtained using the guiding center plasma model. The criterion is particularly suited to configurations with comparable transverse and longitudinal length scales, so-called short, fat equilibria. Under this ordering, the stabilizing effects of plasma compression is significant. These effects are included through the use of a positive definite lower bound on their contribution to an energy principle.

58912 **Free boundary field-reversed configuration (FRC) equilibria in a conducting cylinder.** Spencer, R.L.; Hewett, D.W. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physics of Fluids;* **25**: No. 8, 1365-1369(Aug 1982).

Highly elongated field-reversed configuration (FRC) equilibria are computed in a straight conducting cylinder for the pressure profile p'(psi) = cH(psi), where H(x) is the Heaviside function. The equilibria are found by inverting the Grad—Shafranov equation by means of a Green's function and by solving the resulting nonlinear integral equation. Long equilibria are obtained only for values of the constant c very near a critical value: the equilibria change from 2:1 elongated to infinitely long as c varies by only 0.3%. This criticial value of c is predicted by the average beta condition.

58913 **Ideal magnetohydrodynamic stability limits of a high-β tokamak with superimposed helical fields.** Sherwell, D.; Freidberg, J.P.; Berge, G. (Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physics of Fluids;* **25**: No. 8, 1370-1383(Aug 1982).

The stability of a high-β tokamak with a superimposed single helicity stellarator field is investigated in the context of the sharp boundary surface current model. The analysis treats external ideal magnetohydrodynamic modes including both pressure-driven ballooning effects and current-driven kink instabilities. The results show that the addition of an $l = 2$ field is unfavorable, lowering the allowable Ohmic heating current and decreasing the maximum stable β. The addition of an $l = 3$ field, however, is favorable. Both the allowable Ohmic heating current and maximum stable β are increased as the $l = 3$ amplitude increases.

58914 Parametric instabilities of electron cyclotron waves in plasmas. Tripathi, V.K.; Liu, C.S. (Department of Physics and Astronomy, University of Maryland, College Park, Maryland 20742). *Physics of Fluids;* **25**: No. 8, 1388-1392(Aug 1982).

The parametric instabilities of electron cyclotron waves in (i) the EBT ring and (ii) the large tokamaks, e.g., PLT, have been studied. In EBT, the electron cyclotron pump of finite wavenumber k_0 decays into two Bernstein modes at the second harmonic cyclotron layer and can account for the heating of the ring in the initial phase. The coupling coefficient for this decay vanishes for a dipole pump, whereas the convective threshold with finite k_0 is approximately 200 W/cm^2. For large tokamaks, the convective threshold for various decay channels turns out to be approximately 200 kW/cm^2 at 3 mm wavelength.

58915 Direct-interaction approximation and statistically steady states of three nonlinearly coupled modes. Krommes, J.A. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Physics of Fluids;* **25**: No. 8, 1393-1395(Aug 1982). Contract AC02-76CH03073.

The direct-interaction approximation is used to find statistically steady states of a system of three modes with complex frequencies coupled by a quadratic nonlinearity. These states are compared to the exact predictions of an ensemble of realizations with Gaussian distributed initial conditions. The direct-interaction approximation is shown to be reasonably successful in this context.

58916 Stimulated Raman scattering in large plasmas. Phillion, D.W.; Banner, D.L.; Campbell, E.M.; Turner, R.E.; Estabrook, K.G. (Lawrence Livermore National Laboratory, Livermore, California 94550). *Physics of Fluids;* **25**: No. 8, 1434-1443(Aug 1982). Contract W-7405-ENG-48.

In long pulse, high-energy experiments (4000 J, 2 nsec, 5 x 10^{14} W/cm^2, 1.064 μm) at the Shiva laser facility, several percent of the laser light has been observed to be Raman scattered. The spectrum of the Raman-scattered light was measured from 1.48 to 2.17 μm. The Raman scattering occurred principally at electron densities much lower than the quarter-critical electron density. The high-energy electrons expected in Raman scattering were observed indirectly in these experiments via their bremsstrahlung radiation. Additional experiments show that the Raman instability has a much lower intensity threshold for longer laser pusle length and larger laser spot size. Raman light measurements for 5320 A irradiated disk target experiments are also reported. The light near $2\lambda_0$ or 1.064 μm had both a red- and blue-shifted component. At high intensities, Raman scattering also occurred in the very underdense plasma.

58917 Influence of molecular nitrogen upon plasma channel formation by laser resonance saturation. Measures, R.M.; Wong, S.K.; Cardinal, P.G. (Institute for Aerospace Studies, University of Toronto, 4925 Dufferin Street, Downsview, Ontario, Canada M3H 5T6). *Journal of Applied Physics;* **53**: No. 8, 5541-5551(Aug 1982).

Laser resonance saturation of alkali vapors represents a very attractive method of creating the extended plasma channels of interest in light ion beam fusion. We have undertaken a preliminary study of the influence of molecular nitrogen upon this laser ionization technique. Our results indicate that the electron cooling, resonance quenching, and the increase in the laser energy requirement are acceptable, providing that the alkali seeding exceeds 0.5%.

58918 Ideal magnetohydrodynamic theory of magnetic fusion systems. Freidberg, J.P. (Department of Nuclear Engineering and Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Reviews of Modern Physics;* **54**: No. 3, 801-902(Jul 1982).

Ideal magnetohydrodynamic theory and its application to magnetic fusion systems are reviewed. The review begins with a description and derivation of the model as well as a discussion of the region of validity. Next, the general properties are derived. These are valid for arbitrary geometry and demonstrate the inherently sound physical foundation of the model. The equilibrium behavior of the currently most promising toroidal magnetic fusion concepts are then discussed in detail. Finally, the stability of such equilibria is investigated. Included are discussions of the general stability properties of arbitrary magnetic geometries and of detailed applications to those concepts of current fusion interest.

58919 Ion heating and confinement in a toroidal plasma device with a cusped magnetic field. Rhodes, M.; Dawson, J.M.; Le Boeuf, J.N.; Luhmann, N.C. Jr. (University of California at Los Angeles, Los Angeles, California 90024). *Physical Review Letters;* **48**: No. 26, 1821-1824(28 Jun 1982). Contract AM03-76SF00010;AT03-76ET53019.

A novel toroidal plasma device has been tested in which the plasma is confined in a surfacelike multipole cusp field generated by permanent magnets. A toroidal current, driven by an induced electric field, is preferentially carried by the ions which are directly Ohmically heated (T/sub i/>T/sub e/). Plasma β's of 20%—30% have been observed. Computer simulations verify a simple model of device operation.

58920 Radio-frequency current drive in a fusion-producing plasma. Bhadra, D.K.; Chu, C. (General Atomic Company, San Diego, California). *Physical Review Letters;* **48**: No. 26, 1824-1828(28 Jun 1982). Contract AT03-76ET51011.

A method for driving current in a fusing plasma is proposed. Radio-frequency power is used to prohibit fusion-produced energetic particles from slowing down isotropically or to push them in a preferential direction. As a result, a net plasma current is generated whose efficiency is comparable to other current-drive schemes.

58921 Spectrum of small-scale density fluctuations in tokamaks. Mazzucato, E. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physical Review Letters;* **48**: No. 26, 1828-1830(28 Jun 1982). Contract AC02-76CH03073.

The power spectrum of plasma density fluctuations in the range of frequencies of drift waves has been investigated in the Princeton Large Torus tokamak. The results suggest that the observed fluctuations evolve to a strong nonlinear state, and therefore they emphasize the need for a complete nonlinear theory of drift waves in tokamaks to assess their effects on plasma transport.

58922 Current maintenance in tokamaks by use of synchrotron radiation. Dawson, J.M.; Kaw, P.K. (Department of Physics, University of California, Los Angeles, California 90024). *Physical Review Letters;* **48**: No. 25, 1730-1733(21 Jun 1982). Contract AM03-76SF00010;AC02-76CH03073.

A tokamak at fusion temperatures generates large amounts of synchrotron radiation. By proper configuration of the walls, this radiation can sustain the current. This is accomplished by a fish-scale wall that preferentially reflects radiation propagating in one direction while absorbing that going oppositely. The wall transfers momentum to the electrons through radiation pressure. A rough theoretical treatment shows that at high temperatures (30—50 keV) sufficient current for a steady-state tokamak may be driven.

58923 Multichannel grazing-incidence spectrometer for plasma impurity diagnosis: SPRED. Fonck, R.J.; Ramsey, A.T.; Yelle, R.V. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Applied Optics;* **21**: No. 12, 2115-2123(15 Jun 1982). Contract AC02-76CH03073.

A compact vacuum ultraviolet spectrometer system has been developed to provide time-resolved impurity spectra from tokamak plasmas. Two interchangeable abberation-corrected toroidal diffraction gratings with flat local fields provide simultaneous coverage over the ranges 100-1100 A or 160-1700 A. The detector is an intensified self-scanning photodiode array. Spectral resolution is 2 A with the higher dispersion grating. Minimum readout time for a full spectrum is 20 msec, but up to seven individual spectral lines can be measured with a 1-msec time resoiution. The sensitivity of the system is comparable with that of a conventional grazing-incidence monochromator.

58924 **Surface plasma absorption in an integrating sphere at high optical flux levels.** Kristal, R. (University of California, Los Alamos National Laboratory, P.O. Box 1663, Los Alamos, New Mexico 87545). *Applied Optics;* **21**: No. 11, 1885-1887(1 Jun 1982).

An integrating sphere has been used for laser target reflectivity measurements and nonlinear calibration curve for target surface plasma absorption was determined. (AIP)

58925 **Normal modes and symmetries of the Rayleigh-Taylor instability in stratified fluids.** Mikaelian, K.O. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review Letters;* **48**: No. 19, 1365-1368(10 May 1982). Contract W-7405-ENG-48.

A formalism is presented for calculating all the normal growth modes of the Rayleigh-Taylor instability in a stratified fluid of arbitrary profile. The classical instability is suppressed by the introduction of a finite density gradient at the interface, a technique applicable to inertial confinement fusion targets.

58926 **ICP emission spectrometry: On the selection of analytical lines, line coincidence tables, and wavelength tables.** Winge, R.K.; Fassel, V.A.; Peterson, V.J.; Floyd, M.A. (Ames Laboratory, United States Department of Energy, Iowa State University, Ames, Iowa 50011). *Applied Spectroscopy;* **36**: No. 3, 210-221(May 1982). Contract W-7405-ENG-82.

A thorough knowledge of the spectral emission characteristics of the inductively coupled plasma is a prerequisite for its maximum utilization in atomic emission spectroscopy. Toward this end on Atlas of Spectral Information for Inductively Coupled Plasma, Atomic Emission Spectroscopy has been assembled to provide the analyst with the basic information concerning the analytical capabilities and the potential spectral interferences of the prominent spectral lines of 70 elements. The Atlas contains 232 wavelength scans of 70 elements covering the range of 189 to 517 nm (189 to 597 nm for sodium and the reference blank).. The Atlas also contains a listing of 973 prominent lines with estimated detection limits and a detailed collection of coincidence profiles for 281 of the most prominent lines, each with profiles of ten of the most prevalent concomitant elements superimposed. This paper contains a survey of the spectral information contained in the Atlas.

58927 **Implicit time integration for plasma simulation.** Cohen, B.I.; Langdon, A.B.; Friedman, A. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Journal of Computational Physics;* **46**: No. 1, 15-53(Apr 1982). Contract W-7405-ENG-48.

To increase the size of the time step, and threrby extend the applicability of kinetic plasma simulation, analysis of the stability and accuracy of implicit time integration schemes for plasma particle-in-cell simulation and the synthesis of new algorithms have been undertaken. Three classes of implicit algorithms are considered in general form. Stability and accuracy calculations provide guidelines for the design and application of implicit simulation algorithms, as illustrated in the construction of new difference schemes with desirable properties. Of particular interest are the relaxation of stability constraints on the time step, strong damping of unwanted high-frequency modes, accuracy of the simulation of low-frequency phenomena, numerical secular acceleration, and numerical stability of fast and slow space-charge waves. The potency of higher order accurate differencing schemes in reducing undesirable numerical effects is demonstrated.

58928 **Numerical model for nonaxisymmetric MHD instabilites.** Shestakov, A.I.; Killeen, J.; Schnack, D.D. (National Magnetic Fusion Energy Computer Center, Lawrence Livermore National Laboratory, Livermore, California 94550). *Journal of Computational Physics;* **46**: No. 1, 69-96(Apr 1982). Contract W-7405-ENG-48.

A method is described for studying the stability of two-dimensional equilibria of magnetically confined plasmas. The equations of magnetohydrodynamics (MHD) are linearized and the resulting time-dependent first-order system of equations is solved. Unstable equilibria result in exponentially growing solutions. The plasma is assumed to be incompressible and resistivity is included in the model. The equations are solved in cylindrical coordinates and the perturbations vary as $f_1(r,z,t)$ exp(inθ). Nonaxisymmetric modes (nnot =0) are considered. Tearing mode results for one-dimensional analytic equilibria are compared with earlier work. A numerically generated equilibrium, modeling the field reversed theta pinch experiment, is shown to be unstable to the $n = 1$ tilting mode.

58929 **Recent use of the Thomson parabola ion analyzer.** Anthes, J.P. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Physics Teacher;* **20**: No. 3, 161-164(Mar 1982).

The ablation depth of a laser target is measured as a function of laser intensity. (AIP)

58930 **(FUPH-R—175) Magnetoacoustic oscillations as a plasma-diagnostic technique for a current-carrying plasma column.** Brennan, M.H.; McCarthy, A.L.; Sawley, M.L. (Flinders Univ. of South Australia, Bedford Park. School of Physical Sciences). Oct 1981. 16p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82903314.

Portions of document are illegible.

Magnetoacoustic oscillations were excited in a non-uniform, current-carrying plasma column. Measurements of the oscillating axial magnetic flux at a number of excitation frequencies were used to determine the equilibrium plasma properties. In agreement with previous theoretical studies, the radial profile of the plasma density is shown to be accurately determined, while it is not possible to obtain detailed information on the radial profile of the equilibrium magnetic field.

58931 **Weak double layers.** Hershkowitz, N.; Payne, G.L.; DeKock, J.R. (Iowa Univ., Iowa City (USA). Dept. of Physics and Astronomy); Chan, C. (Iowa Univ., Iowa City (USA). Dept. of Electrical and Computer Engineering). *Plasma Physics;* **23**: No. 10, 903-925(Oct 1981).

The characteristics of weak double layers with potential steps eΔphiTsub(e) approximately equal to 5 are studied in a triple plasma device and compared with a kinetic model. Very one-dimensional laboratory double layers are produced and an explanation is given of many of the features of the laboratory double layers using a one-dimensional kinetic model. The model calculations illustrate the role of the trapped ions in determining the position of the double layer, and they show the dependence of the length of the double layer on the entering ion and electron fluxes. Ion beams are found to have velocities much greater than the Bohm velocity. It is found that the characteristics of weak double layers are more sensitive to the boundary conditions.

58932 **Interferometric measurements of plasma density fluctuations during the formation phase in the ZT-40 reversed-field pinch.** Jacobson, A.R. (Los Alamos National Lab., NM (USA)). *Plasma Physics;* **23**: No. 10, 927-947(Oct 1981).

A seven-chord infrared interferometer is used to study plasma density fluctuations during the formation phase in the ZT-40 toroidal pinch device. The mean quantities are found to depend systematically on the level of magnetic shear in the pinch discharge, in a manner which suggests that the density disturbances are elongated structures oriented parallel to the local magnetic field. The spatial correlation results are compared with earlier work on the Zeta device.

58933 **Nonlinear evolution of the sheet pinch.** Matthaeus, W.H.; Montgomery, D. (College of William and Mary, Williamsburg, VA (USA). Dept. of Physics). *Journal of Plasma Physics;* **25**: 11-41(Feb 1981).

An incompressible, dissipative numerical code of the spectral type is used to follow the nonlinear evolution of a magnetohydrodynamic sheet pinch in two spatial dimensions. The evolution involves considerable turbulent activity in the electric current field, with the excited spatial scales ranging from the size of the containing volume down to the dissipation lengths of the magnetic and velocity fields. Strong current filamentation near magnetic X-points is observed, as is 'jetting', or expulsion of magnetofluid from the vicinity of the X-point parallel to the current sheet.

58934 **Three electrostatic temperature drift instabilities.** Gary, S.P.; Abraham-Shrauner, B. (Los Alamos Scientific Lab., NM (USA)). *Journal of Plasma Physics;* **25**: 145-159(Feb 1981).

Temperature drift instabilities, modes which can be driven unstable solely by a temperature gradient perpendicular to a magnetic field are considered. The linear electrostatic dispersion relation for a Vlasov plasma in a uniform magnetic field is used and propagation is assumed to be in the plane perpendicular to the gradient. Three temperature drift instabilities are found. The ion temperature drift instability arises at frequencies much below the ion cyclotron frequency, the electron temperature drift instability propagates somewhat below that frequency and the lower-hybrid temperature drift instability has frequencies above the lower-hybrid frequency. The first of these modes is driven by an ion temperature gradient and is enhanced by increasing Tsub(e)/Tsub(i). The latter two modes are driven by an electron temperature gradient and are enhanced by a decreasing Tsub(e)/Tsub(i). Density gradients are considered as an additional source of free energy, and comparisons of temperature drift with density drift instabilities are made.

58935 **Approach to rapid plasma shape diagnostics in tokamaks.** Lee, D.K.; Peng, Y.K.M. (Oak Ridge National Lab., TN (USA)). *Journal of Plasma Physics;* **25**: 161-173(Feb 1981).

A diagnostic procedure which allows the plasma boundary shape and location in a tokamak to be estimated by using numerical values of the poloidal magnetic flux function psi in the vicinity of the plasma is described. In the case of the Impurity Study Experiment (ISX-B) tokamak, the magnetic sensor coils located around the periphery of the vacuum chamber provide information on deltaBsub(R)/deltat and deltaBsub(Z)/deltat, which can be processed to obtain data on psi (and deltapsi/deltan) through the relation Bsub(R) = -R^{-1}deltapsi/deltaZ and Bsub(Z) = R^{-1}deltapsi/deltaR. This leads to a Cauchy boundary condition for the Grad-Shafraov equation Δ^*psi = O in the region between the contour of the sensor coil locations and the plasma boundary flux surface. Numerical equilibria calculated for the ISX-B with different shapes are used to simulate psi data along the coil locations. Random errors are added to the data to test the efficacy of two different approaches: global fitting and local fitting. Reasonably accurate results are obtained by the method of global fitting of the boundary values, which is based on the expansion of psi in terms of eigenfunctions of Δ^*psi = O in a toroidal ring co-ordinate system. This approach is found to permit a relatively large random error in poloidal B field values at the sensor coils and appears to have the potential of rapidly displaying the plasma shape and location.

58936 **Fat banana carrier injection for electric field generation in tokamaks.** Downum, W.B.; Miley, G.H. (Univ of Illinois, Urbana, IL 61801). *Transactions of the American Nuclear Society;* **39**: 243-244(1981). (CONF-811103—).

From ANS winter meeting; San Francisco, CA, USA (29 Nov 1981).

58937 **Burn performance of inertial confinement fusion targets.** Blue, T.E.; Choi, C.K.; Hardy, C.R.; Harris, D.B.; Miley, G.H. (Univ of Illinois, Urbana, IL 61801). *Transactions of the American Nuclear Society;* **39**: 245-246(1981). (CONF-811103—).

From ANS winter meeting; San Francisco, CA, USA (29 Nov 1981).

58938 **Density profiles in tokamaks from electron cyclotron radiation spectra.** Boyd, D.A. (Maryland, University, College Park, Md.). *International Journal of Infrared and Millimeter Waves;* **1**: 45-55(1980).

Measurement of the line shape of optically thick and optically thin lines in the electron cyclotron radiation spectrum emitted by a tokamak plasma may yield both electron temperature and density profiles. Currently temperature profiles are routinely extracted from optically thick lines. Consequently, this paper is addressed to the density profile problem. Algorithms for extracting density profiles are outlined in the case of uncontrolled reflection and controlled reflection of the cyclotron radiation within the tokamak vacuum chamber.

58939 **(UCRL-Trans—11780) Numerical model of particle motion in an axially nonsymmetric plasma trap.** **Lysyanskiy, P.B.; Tiunov, M.A.; Fomel, B.M. (Lawrence Livermore National Lab., CA (USA)). 1979. Contract W-7405-ENG-48. Translation of Institute of Nuclear Physics, SO AN SSSR, preprint 79-64, Novosibirsk, pp 1-19, Russian. 31p. NTIS, PC A03/MF A01. Order Number DE82019541.**

Portions of document are illegible.

Computations have been conducted of transverse particle motion in a model magnetic trap without axial symmetry. Under the model the azimuthal particle motion was considered due to the radial electric field in the plasma and also elastic particle scattering. A method has been developed for determining the reflection function in the mirrors of a realistic trap. Neoclassical diffusion has been studied in the model trap and in the central cell of the planned trap AMBAL-I.

58940 **Determination of plasma ion temperatures by analysis of charge-exchange neutrals.** Eubank, H.P. (Princeton University, Princeton, NJ). pp 7-16 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

The paper discusses the principles and techniques by which analysis of the fast neutrals produced by charge exchange in the plasma volume can be used to determine the plasma ion temperature. The fast neutral flux emerging from the plasma interior declines sharply with increasing density and minor radius due to both a drop in the neutral density within the plasma interior as well as attenuation of the outgoing flux. Methods for artificially enhancing the neutral density with spatial resolution adequate for ion temperature profile measurements are considered. Neutral beam heating experiments have necessitated fast neutral measuring systems containing both momentum and energy analysis in order to distinguish the thermal plasma from the slowing down distribution of beam particles. This has enabled measurements on PLT of the thermal species, e.g., D(+), to be extended into the energy range where the beam particles H(+) are orders of magnitude more abundant.

58941 **Particle beam systems in plasma diagnostics.** Eubank, H.P. (Princeton University, Princeton, NJ). pp 17-34 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

The paper reviews basic principles of active beam systems in plasma diagnostics, with emphasis on systems for the measurement of plasma potential, and current and impurity profiles. Attention is given to the following: determination of ion density and Zeff beam dissociation and optical techniques heavy ion beam probes and tangentially injected neutral beam probes.

58942 **Diagnostics for mirror machines.** Osher, J.E. (California University, Livermore, CA). pp 47-77 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979). Contract W-7405-ENG-48.

From International school of plasma physics; Varenna, Italy (Sep 1978).

The neutral-beam-heated quasi-dc mirror confinement systems are described and a general example of mirror diagnostics is given by a discussion of the diagnostics used on the 2XIIB experiment at the Lawrence Livermore Laboratory. Mirror machine diagnostics are then developed in more detail and attention is given to the special diagnostic needs of future mirror machines emphasis is placed on diagnostics involving the higher-power neutral beams to be used with these future machines.

58943 **Soft X-ray measurements.** Von Goeler, S. (Princeton University, Princeton, NJ). pp 79-109 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

The paper considers measurements of soft X-ray emission from tokamaks and other low-beta confinement devices, with emphasis on the interpretation of data and on the techniques used for large machines. Typical X-ray spectra for tokamaks are presented and attention is given to basic processes which contribute to their formation. This is followed by a discussion of measurements of the impurity parameter Zeff, ultrasoft X-ray radiation, and ion temperature. X-ray fluctuation measurements and experimental results on the disruptive instability are also discussed.

58944 **Iron radiation in tokamak discharges.** Hinnov, E. (Princeton University, Princeton, NJ). pp 139-148 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

Iron ion resonance-line intensity measurements are described as a representative sample of spectroscopic diagnostics of tokamak plasmas. A brief outline of the tokamak discharge characteristics is followed by a description of the spectrometer, and its calibration for absolute intensity measurements in the vacuum ultraviolet wavelength region. Then iron ion resonance lines in the wavelength range 90-360 A, from ionization states FeXV through FeXXIV, are shown as observed in the PLT tokamak. A discussion of the principal excitation processes leading to the emission of these lines in tokamak-type plasmas, and of the appropriate atomic cross-sections and rate coefficients, is then followed by quantitative measurements of these emissions in time and space in a PLT tokamak discharge. The results are interpreted in terms of iron ion concentrations, their behavior in the discharge, and their implications to radiative energy loss, contributions to electrical resistivity, and ion confinement times in the plasma.

58945 **Thomson scattering.** Dimock, D. (Princeton University, Princeton, NJ). pp 271-301 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

The paper presents some aspects of Thomson scattering measurements from a viewpoint of an experimentalist. The theory underlying Thomson scattering from plasmas is outlined, and plasma from the incoherently scattered light is discussed, including the advantages and limitations of these techniques. Details of the practical experimental realization of Thomson scattering measurements and methods of solving problems inherent in these techniques are described. Finally, information that can be obtained using coherent Thomson scattering is examined, and some signal to noise problems of these methods are considered.

58946 **On the physics of strong turbulence for electron plasma waves.** Papadopoulos, K. (U.S. Navy, Naval Research Laboratory, Washington, DC). pp 355-365 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

Research related to the new physics of the so-called strong Langmuir turbulence and the dynamics involved is still in a rudimentary stage. It appears that the transition of a plasma to a state of strong turbulence is in a sense similar to a phase transition where several modes combine to form some kind of cluster. The most reasonable approach to understanding the properties of this new turbulent state should rely on a combination of computational, quasi-analytic, and experimental investigations. The existence of a spiky state has already been observed both in the laboratory and in space. In the present paper, an attempt is made to present some of the properties and consequences of the strong turbulence theory, as they are currently understood, with a view to their importance in the development of plasma diagnostics.

58947 **Neutron diagnostics.** Eubank, H.P. (Princeton University, Princeton, NJ). pp 403-420 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

Neutron production in Maxwellian plasmas of deuterium ions is discussed from the standpoint of an ion temperature diagnostic. Expressions for the cross sections and reactivities vs temperature are presented. Distortions to the neutron producing tail of the distribution which can lead to erroneous 'temperature' are discussed along with processes which lead to non-thermonuclear neutron production. Fast neutron counting with good energy resolution is considered in the light of neutral beam injection heating and/or high ion temperatures as a means of deducing beam energy distributions and temperatures. Experimental results from PLT are presented to illustrate current techniques and problems in interpretation of the ion temperature.

58948 **Interferometric measurement of plasma density in high-beta plasmas.** Quinn, W.E. (California University, Los Alamos, NM). pp 421-432 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

The paper examines holographic and coupled-cavity interferometry for measuring the plasma electron density. In the application of holography to plasma interferometry the hologram makes possible storing a complete phase and amplitude information on the plane light wave passing through a plasma region. A laser beam is divided into a scene beam directed through the plasma and a reference beam passing outside the plasma. A double exposure, one without plasma and one with plasma in the scene beam, results in a holographic interferogram which can be reconstructed in white light. The coupled-cavity laser interferometer is particularly applicable to the measurement of pulsed plasma densities because the intensities of the laser output is modulated if a small fraction of a gas laser's output radiation is reflected into the laser with an external mirror.

58949 **Measurement of plasma beta in high beta fusion experiments.** Quinn, W.E. (California University, Los Alamos, NM). pp 433-446 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

It is possible to infer the beta profile by combining measurements of the magnetic flux excluded by the plasma column and the radial plasma luminosity distribution. This technique has been used extensively in linear magnetic fusion experiments such as the theta pinch. The excluded flux is measured by a balanced loop-probe arrangement and a relative density profile is obtained from a multichannel luminosity profile apparatus. These measurements give the plasma beta, radius, position, and energy line density, and when combined with a single-chord density measurement, the absolute density profile and total plasma temperature.

58950 **Faraday rotation measurements in high-beta fusion experiments.** Quinn, W.E. (California University, Los Alamos, NM). pp 447-458 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

Faraday rotation is the rotation of the direction of polarization of a plane-polarized electromagnetic wave as it propagates parallel to a magnetic field in a plasma-magnetic field medium. The Faraday rotation measurement, described in the present paper, uses a 1.5-mm diam He-Ne laser beam (6328 A) as a plasma-magnetic field probe, and a calcite Wollaston prism as the polarization analyzer with silicon diode detectors. The rotation is a small effect at optical wavelengths even for substantial densities and fields. The rotation is proportional to the square of the probing wavelength, which suggests the use of infrared laser wavelengths.

58951 **Particle-beam fusion experiments and diagnostics.** Wharton, C.B. (Cornell University, Ithaca, NY). pp 459-481 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

The paper examines particle-beam fusion experiments and diagnostics. Two experimental approaches, pellet-compression and the long solenoid are considered, describing two proposed break-even experiments, and some of the source, target, and diagnostic requirements. High power ion developments are analyzed and applications are discussed. Some diagnostics problems and useful techniques in overcoming them are outlined these techniques are different from those used in other fusion experiments because of the short time scales and large power levels encountered. Beam-plasma long solenoid experiments, intense ion beam accelerators, magnetic measurements of beam-plasma interactions, and nuclear reactions are examined.

58952 **Laser fusion diagnostics.** Coleman, L.W. (California University, Livermore, CA). pp 483-509 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979). Contract W-7405-ENG-48.

From International school of plasma physics; Varenna, Italy (Sep 1978).

The paper reviews laser fusion diagnostics whose goal is to make measurements over large ranges of physical parameters with space-time resolutions of 1 micron and 1 psec. Various laser fusion diagnostics techniques including optical, ultraviolet probing, and X-ray are discussed, and high temporal and spatial resolution optical diagnostics of laser performance, energy balance, and applicable plasma probing techniques are reviewed. Spatially, temporally, and spectrally resolved X-ray diagnostics methods and instruments are examined, with emphasis on high spatial resolution imaging and applications, and on high temporal resolution X-ray streak camera applications to exploding pusher target experiments. Finally, particle diagnostics and systems designed to diagnose target performance via yield and temperature measurements to determine the characteristics of compressed targets are considered.

58953 **Data acquisition.** Wing, W.R. (Oak Ridge National Laboratory, Oak Ridge, TN). pp 525-566 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

A three lecture overview on the hardware and software necessary to assemble a useful data acquisition system for pulsed fusion experiments is presented. Attention is given to the Oak Ridge Data System, where diagnostics are divided into two categories: development and monitor diagnostics. The data system project supports two analysis packages and one set of FORTRAN-callable subroutines. It is determined that the system provides relative isolation between diagnostics. The CAMAC complete set of standards is examined, specifying the mechanical and electrical properties of the CAMAC compatible hardware.

58954 **The study of plasma formation in fusion devices.** Bengtson, R.D. (Texas University, Austin, TX). pp 581-600 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

The atomic and plasma physics processes important in the formation of a plasma will be discussed. Diagnostic techniques important in this regime such as electron velocity analyzers, spectroscopy, electric and magnetic probes will be presented. Examples from a toroidal machine will be given and compared with a zero dimensional model of plasma formation.

58955 **Measurements of wall impurity concentrations during tokamak discharges.** Schwirzke, F. (U.S. Naval Postgraduate School, Monterey, Calif.); Oren, L. (California University, Los Angeles, Calif.). pp 601-615 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

Impurities released by plasma-surface interactions play a major role in influencing the performance characteristics of many of today's tokamaks. A new laser probing technique has been developed to determine the concentration of loosely bound impurities present on the surface at any time during the tokamak discharge. Surface spot heating by a laser pulse induces desorption of loosely bound species. Coincident spectroscopic measurements of the locally increased inpurity radiation show the species and amount of impurities which were present on the surface. The first laser shot onto a new surface produces a large impurity influx into the plasma, while consecutive laser shots produce much smaller signals. These results reveal the existence of loosely bound chromium and iron on tokamak surfaces.

58956 **New techniques for plasma density profiling.** Kristal, R. (California University, Los Alamos, NM). pp 617-636 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979).

From International school of plasma physics; Varenna, Italy (Sep 1978).

Two new techniques for the measurement of plasma density profiles are presented. The two approaches are aimed at simultaneously overcoming uncertainties due to the Abel inversion and plasma irreproducibility. The first technique combines standard heterodyne interferometry with rapid spatial scanning. The Abel inversion problem is addressed by the very high spatial resolution obtainable, while the plasma irreproducibility is overcome by multiple framing in a single discharge. The technique requires only a single detector channel and is applicable over a wide range of parameters. The apparatus has been built and successfully bench tested. The second technique, currently in the design stage, is based on Thomson scattering of a short laser pulse. With a wavepacket small compared to the plasma, the nondispersed scattered light pulse shape is essentially the plasma profile. Additionally, the short light pulse allows time of flight discrimination against instrumental scatter. With very modest pulse energy, the scattered power greatly exceeds the plasma radiation and signal statistics determine the detection quality.

58957 **Fiber optic applications in plasma diagnostics.** Lyons, P.B. (California, University, Los Alamos, N. Mex.); Looney, L.D. (EG G, Inc., Goleta, Calif.). pp 388-395 of Los Alamos Conference on Optics. Liebenberg, D.H. Palos Verdes Estates, CA; Society of Photo-Optical Instrumentation Engineers (1979).

From Conference on Optics; Los Alamos, NM, USA (23 May 1979).

The advantages and applications of optical fiber data transmission in radiation diagnostics are considered. The individual components of such a system are each discussed. Only passive systems utilizing a direct radiation-to-light conversion are studied. The development of new scintillators with long wavelength emission characteristics was critical to such application and scintillators with a FWHM of 1.4 ns and significant output at 600 nm have been achieved. Cerenkov converters also are used in high bandwidth systems. System examples using scintillators are given, which show a bandwidth exceeding 100 MHz over distances of almost 200 m (with a dynamic range of 40,000) or 500 m (with a dynamic range exceeding 100). With a Cerenkov converter, system examples show a bandwidth approaching 1 GHz over 1 km fiber lengths. Experimental data that illustrate both systems will be shown.

58958 **(AD-A—108935/8) The development of high-intensity negative ion sources and beams in the USSR. Technical report.** Wells, N. (RAND Corp., Santa Monica, CA (USA)). Sep 1981. 81p. (RAND/R—2816-ARPA). NTIS, PC A05/MF A01.

This report reviews Soviet R and D of (1) high-intensity negative ion sources and (2) transport and focusing of negative ion beams, using Soviet open literature of the past ten years, and correlates this data with data on Soviet institutes responsible for negative ion beam development. The Soviets are developing intense negative ion beams as the basis for creating neutral beams for injection into mirror traps and tokamaks, for inertial confinement fusion, and possibly for exoatmospheric beam weapon applications. The report focuses specifically on surface-plasma-type ion sources, which were first developed in the USSR and which show great promise for creating beams of high intensity, high brightness, and low emittance. Mechanisms for optimum negative ion beam transport are also discussed.

58959 **(AD-A—109854/0) Coalescence of spheromaks.** Reiman, A. (Maryland Univ., College Park (USA). Lab. for Plasma and Fusion Energy Studies). Jul 1981. 45p. (PL—82-005; PUB—82-021). NTIS, PC A03/MF A01.

The coalescence of two spheromaks is described using the quasi-ideal model of reconnection. Nonaxisymmetric effects are found to play an important role in general. Possible applications of repeated coalescence are studied, including heating the spheromak plasma, building up a large spheromak from smaller ones, and maintaining a spheromak in steady state. The analysis suggests that coalescence experiments could also provide a valuable method for studying magnetic field relaxation.

58960 **(AD-A—111663/1) Ion diode research on the Aurora accelerator. Final report 5 Jan 81-5 Jan 82.** Meger, R.A. (JAYCOR, Alexandria, VA (USA)). 27 Jan 1982. 175p. NTIS, PC A08/MF A01.

Within the last few years interest in ion beams for inertial confinement fusion (ICF) applications has increased significantly. The Naval Research Laboratory (NRL), with support from JAYCOR, has been in the forefront of that research effort. The ion source which NRL has concentrated on is known as the pinch reflex diode (PRD). This type of ion diode was originated at NRL with JAYCOR assistance and is presently one of the few designs with application to ICF. The PRD, is comprised of a hollow cylindrical cathode of radius R separated from a plasma anode by a diode gap D. When a voltage is placed across the gap, electrons emitted from the cathode are accelerated toward the anode while being pinched toward the axis by their own magnetic field. The anode is normally made of a disk of thin dielectric material connected to a conducting backplate by a small conducting cylinder on axis. Electrons hitting the anode pass through and are reflexed back into the diode gap by the magnetic field from the current driven in the central button. Electrons undergo the combined reflexing and pinching motion until they are collected by the central button. Ions from the plasma formed on the front surface of the dielectric anode due to electron heating or flashover mechanisms are accelerated across the diode gap toward the cathode. The relative ion and electron current densities depend on the difference in crossing times of the two charge species. For diode voltages in the 1-10 MV range the ions move in nearly straight line trajectories at nonrelativistic velocities while the electrons are quickly accelerated to near the speed of light.

58961 **(CEA-CONF—6066) Proton beam - target interactions at low and high power densities.** Duborgel, B.; Dufour, J.M.; Gouard, P. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Oct 1981. 15p. (CONF-811028—14). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702259.

From 23. annual meeting of the division of plasma physics of the APS; New York, NY, USA (12 Oct 1981).

Interaction of light ions beams with various targets is calculated from an ion energy deposition model coupled with an hydrodynamic code, taking account of the plasma evolution during the target heating. The calculations are made in two cases: at low power densities available on a laboratory machine as SIDONIX, at high power densities required for pellet fusion. In the case of low power densities the requirements of a neutron target implosion experiment are discussed. The simulation of deposition processes at high power densities shows that the energy deposition characteristics are strongly modified during the target heating.

58962 **(CONF-801237—) Proceedings of the meeting on electrical insulators fusion magnets.** (USDOE Office of Energy Research, Washington, DC. Development and Technology Div.). Nov 1981. 334p. NTIS, PC A15/MF A01. Order Number DE82006199.

From Meeting on electrical insulators for fusion magnets; Germantown, MD, USA (15 Dec 1980).

Separate abstracts were prepared for each of the 20 included sections. (MOW)

58963 **(DOE/ER—0046/7) Damage analysis and fundamental studies. Quarterly progress report, July-September 1981.** (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1981. Contract AC06-76FF02170. 256p. NTIS, PC A12/MF A01. Order Number DE82006098.

Portions of document are illegible.

This report is the fifteenth in a series of Quarterly Technical Progress Reports on Damage Analysis and Fundamental Studies (DAFS), which is one element of the Fusion Reactor Materials Program, conducted in support of the Magnetic Fusion Energy Program of the US Department of Energy (DOE). The first eight reports in this series were numbered DOE/ET-0065/1 through 8. Other elements of the Materials Program are: (1) Alloy Development for Irradiation Performance (ADIP), (2) Plasma-Materials Interaction (PMI), and (3) Special Purpose Materials (SPM). This report is organized along topical lines in parallel to a Program Plan of the same title so that activities and accomplishments may be followed readily, relative to that Program Plan. Thus, the work of a given laboratory may appear throughout the report. The Table of Contents is annotated for the convenience of the reader.

58964 **(DOE/ER—0113) Special-purpose materials for magnetically confined fusion reactors. Third annual progress report.** (USDOE Office of Energy Research, Washington, DC. Development and Technology Div.). Nov 1981. 114p. NTIS, PC A06/MF A01. Order Number DE82005310.

Portions of document are illegible.

The scope of Special Purpose Materials covers fusion reactor materials problems other than the first-wall and blanket structural materials, which are under the purview of the ADIP, DAFS, and PMI task groups. Components that are considered as special purpose materials include breeding materials, coolants, neutron multipliers, barriers for tritium control, materials for compression and OH coils and waveguides, graphite and SiC, heat-sink materials, ceramics, and materials for high-field (>10-T) superconducting magnets. It is recognized that there will be numerous materials problems that will arise during the design and construction of large magnetic-fusion energy devices such as the Engineering Test Facility (ETF) and Demonstration Reactor (DEMO). Most of these problems will be specific to a particular design or project and are the responsibility of the project, not the Materials and Radiation Effects Branch. Consequently, the Task Group on Special Purpose Materials has limited its concern to crucial and generic materials problems that must be resolved if magnetic-fusion devices are to succeed. Important areas specifically excluded include low-field (8-T) superconductors, fuels for hybrids, and materials for inertial-confinement devices. These areas may be added in the future when funding permits.

58965 (DOE/ER/52076—2) **EPFL (Swiss) fusion-fission hybrid experiment. Progress report No. 2, February 1-April 30, 1982.** Woodruff, G.L.; Sitaraman, S. (Washington Univ., Seattle (USA). Dept. of Nuclear Engineering). 22 May 1982. Contract AT06-82ER52076. 24p. NTIS, PC A02/MF A01. Order Number DE82020265.

Portions of document are illegible.

Most of the activity during the current reporting period was related to Monte Carlo code development in order to accurately model the Haefely neutron source which will be used to drive the experiment. Continued liason was maintained with the staff of the Institut de Genie Atomique (IGA) of the Ecole Polytechnique Federale de Lausanne (EPFL) where the LOTUS Facility is located.

58966 (DOE/ET/51013—25) **Near-term tokamak-reactor designs with high-performance resistive magnets.** Cohn, D.R.; Bromberg, L.; Williams, J.E.C.; Becker, H.; Leclaire, R.; Yang, T. (Massachusetts Inst. of Tech., Cambridge (USA). Plasma Fusion Center). Oct 1981. Contract AC02-78ET51013. 13p. (PFC/CP—81-2; CONF-811046—15). NTIS, PC A02/MF A01. Order Number DE82007365.

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

Portions of document are illegible.

Advanced Fusion Test Reactors (AFTR) designs have been developed using BITTER type magnets which are capable of steady state operation. The goals of compact AFTR designs (with major radii R ~ 2.5 - 4 m), include DT ignition with large physics margins; high duty cycle, long pulse operation; and DD-DT operation with low tritium concentration. Larger AFTR designs (R ~ 5 m), have the additional goal of early demonstration of self sufficiency in tritium production. The AFTR devices could also serve as prototypes for commercial reactors. Compact ignition test reactors have also been designed (R ~ 1 - 2 m). These designs use BITTER magnets that are inertially cooled starting at liquid nitrogen temperature. A detailed engineering design was developed for ZEPHYR.

58967 (ECN—110) **Belt-shaped screw-pinch reactor.** Bustraan, M.; Klippel, H.Th.; Veringa, H.J.; Verschuur, K.A.; Brandt, B.; Hoekzema, J.A.; Schuurman, W.; Damstra, G.C.; Lievense, K. (Netherlands Energy Research Foundation, Petten). Dec 1981. 70p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE82702262.

The belt-shaped screw pinch is a pulsed toroidal plasma with an elongated cross-section. Force-free currents in an outer plasma envelope of low density allow beta to rise to high values in the order of 50%. This is a potential possibility to develop an economically attractive reactor. The physical requirements of its realization are described: formation, heating and ignition of a very small amount of the fuel to be burnt in one pulse by the fields generated by normal or superconducting coils. Then follows injection of the greater part of the fuel by D-T pellets and consequent plasma heating and expansion by nuclear reactions without undue disturbing of the plasma current configuration. Technical requirements include an insulating first wall and fast rising magnetic fields produced by superconducting coils. This reactor system is compared with the tokamak and the reversed-field pinch system.

58968 (EPRI-AP—2489) **Evaluation of magnetic-confinement-fusion engineering opportunities on existing and planned facilities. Final report.** DeFreece, D.A. (McDonnell Douglas Astronautics Co., St. Louis, MO (USA)). Jul 1982. 197p. NTIS, PC A09/MF A01. Order Number DE82905816.

Portions of document are illegible.

This report addresses the identification of the critical engineering data needs for the commercialization of magnetic confinement fusion (MCF). The project assessed these for twenty-four MCF reactor designs. This resulted in the identification of seventy-eight critical engineering data requirements. These were weighted and ranked to arrive at a workable number of potential experimental areas that would contribute to the needed data base. These were presented to a workshop of MCF reactor concept advocates, technologists, experimentalists and test facility managers for evaluation. They recommended a set of specific experiments to resolve the identified needs. Using the criteria of high benefit-to-cost, timeliness, and appropriateness for EPRI sponsorship, the list of workshop-recommended experiments was narrowed to a selected set of twenty. These were further explored to enable a selection of ten experiments for consideration of sponsorship by EPRI. The selected experiments were then examined in more detail regarding the justification for the experiment, preliminary experiment definition, expected results, schedule and milestones and the approximate experiment cost. These ten experiment plans are discussed.

58969 (EPRI-AP—2515) **Ceramic materials for fusion reactors. Final report.** Trantina, G.C.; Corelli, J. (General Electric Co., Schenectady, NY (USA); Rensselaer Polytechnic Inst., Troy, NY (USA)). Jul 1982. 85p. NTIS, PC A05/MF A01. Order Number DE82905812.

Siliconized silicon carbide was identified as the most promising low-activity ceramic for use in fusion first walls and blankets. Further design and materials studies indicated that a cylindrical ceramic module attached to a low-activity aluminum backing plate can be designed with a very low probability of failure at a wall loading of 1 MW/m^2, assuming no degradation of the mechanical and physical properties of the ceramic. To achieve the low probability of failure, strengthening and proof testing of the ceramic by a heat treatment at 1200°C are necessary. Irradiation testing of silicon carbide concentrated on B^{10} doped specimens to study the effect of helium production during irradiation. Previous indications of a rapid decline in strength of boron-doped sintered alpha silicon carbide were confirmed. The strength of siliconized silicon carbide also decreases with increasing helium generation, but at a relatively slow rate. A strength decline of 24% was noted after irradiation to a fluence of 7.6×10^{24} n/m^2, during which 1280 AppM helium was produced. More refined and longer duration irradiation experiments are needed to determine if this decline in strength is likely to occur under actual fusion reactor operating conditions.

58970 (EUR—6584(Vol.1), pp 421-423) **Introduction of impurities due to plasma-wall interaction.** Behrisch, R. (EURATOM-IPP Association, Garching, Germany, F.R.). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

58971 (EUR—6584(Vol.1), pp 425-447) **Plasma-wall interaction and the processes determining the hydrogen particle balance.** Behrisch, R. (EURATOM-IPP Association, Germany, F.R.). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

For a hot plasma as investigated in fusion research, the magnetic confinement is not perfect. The particles leak out through the magnetic surfaces and hit the surrounding solid walls. They are partly recycled from the wall by backscattering and release of gas atoms previously implanted and trapped in the wall material. As there is no thermal equilibrium between the plasma and the solid, the Plasma Wall Interaction has to be understood in terms of the various atomic processes taking place at the first wall. The processes influencing the hydrogen particle balance have only recently been investigated in laboratory experiments. While particle backscattering is reasonably understood, the processes of trapping, diffusion and release of the gas atoms from the solid are more difficult to describe, because they depend on many parameters including the history of the solid wall and its temperature.

58972 (EUR—6584(Vol.1), pp 449-452) **Particles refuelling.** Duechs, D. (EURATOM-IPP Association, Garching, Germany, F.R.). 1979. NTIS (US Sales Only), PC A21/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

58973 (EUR—6584(Vol.2), pp 503-533) **Operational characteristics of intermediate and low field tokamaks.** Hawryluk, R.J. (Princeton University, USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

The results from intermediate and low field devices will be described with particular attention to the way these results apply to future devices. In particular, developments in impurity control and plasma handling techniques in ohmically heated discharges are reviewed. These developments have been important in optimizing the performance of tokamak devices.

58974 (EUR—6584(Vol.2), pp 535-555) **Neutral beam injection experiments.** Goldston, R.J. (Princeton Univ., USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

In this lecture we will review experimental aspects of neutral beam heating on tokamaks. We will begin by assessing recent progress in high-current, high-voltage neutral beam technology. We will then briefly look at the problems of beam penetration into large dense reactor-grade plasmas. After this we will examine the experimental data available on the physics of beam ion thermalization, and finally we will review the results from recent neutral beam injection experiments.

58975 (EUR—6584(Vol.2), pp 557-570) **Regimes of operation in the Princeton Large Torus.** Hosea, J. (Princeton Univ., USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

In the quest for optimum discharge conditions in the Princeton Large Torus (PLT), a variety of discharge regimes have been produced. These separate broadly into two main categories - those regimes with $m >= 2$ oscillatory MHD instabilities and often hollow electron profiles for tungsten limiters, and those regimes for which the electron temperature is sufficiently peaked to support the internal sawtooth or near-sawtooth ($m = 1$) instability. The internal sawtooth regime is found to be optimum for confinement but to be more difficult to select when low-Z impurity concentrations have been reduced with low power discharge cleaning or gettering to permit extension of the high density operation limit. Gas programming is used to cool the plasma periphery, thereby reducing the high-Z impurity concentrations and causing the current channel to constrict into the sawtooth regime, and then to attain the desired plasma density. With dicharges selected in this manner, gross energetic confinement times up to approximately 100 msec have been obtained at densities of approximately 10^{14} cm^{-3}, and very high ion and electron temperatures have been produced with neutral beam injection heating at lower densities with no observable deleterious effect on energy confinement.

58976 (EUR—6584(Vol.2), pp 633-658) **Tandem mirror and field-reversed mirror experiments.** Coensgen, F.H.; Simonen, T.C.; Turner, W.C. (University of California, Livermore, USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Multiple-mirror systems offer significant enhancement of the power balance above that attainable from a conventional single-cell mirror reactor. Several multiple-mirror configurations are under experimental investigation: the tandem mirror, the high-density multiple-mirror, and the field-reversed mirror. This paper is largely devoted to tandem mirror and field-reversed mirror experiments at the Lawrence Livermore Laboratory (LLL), and briefly summarizes results of experiments in which field-reversal has been achieved. In the tandem experiment, high-energy, high-density plasma (nearly identical to 2XIIB plasmas) are located at each end of a solenoid where plasma ions are electrostatically confined by the high positive potentials arising in the "end plug" plasmas. End plug ions are magnetically confined, and electrons are electrostatically confined by the overall positive potential of the system. The field-reversed mirror reactor consists of several small field-reversed mirror plasma linked together for economic reasons. In the LLL Beta II experiment, generation of a field-reversed plasma ring will be investigated using a high-energy plasma gun with a transverse radial magnetic field. This plasma will be further heated and sustained by injection of intense, high-energy neutral beams.

58977 (EUR—6584(Vol.2), pp 687-724) **Burn phase and structural problems of compact fusion experiments.** Coppi, B. (Massachusetts Institute of Technology, USA); Taroni, A. (CNEN, Bologna, Italy). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

The present paper is organized as follows: in Section II we give the reference parameters of an experiment of the Ignitor type, and give the main justification for their choice. In Section III we describe the transport model on the basis of which the heating cycles for this kind of experiment can be predicted. In Section IV we describe the structural analysis that we have carried out for the main magnet systems of the device and the numerical codes that we have developed and used for this analysis. In Section V we indicate the advantages that could be realized by adopting composite materials for the main magnet structures. In Section VI we discuss the foreseeable applications of an Ignitor type of device and indicate how it may be possible to employ one for experiments to demonstrate net power production.

58978 (EUR—6584(Vol.2), pp 725-748) **Tokamaks TFTR, JT60 and JET.** Bickerton, R.J. (JET Joint Undertaking, Abingdon, England). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Three large tokamaks in the several megampere discharge current range are at present under construction. They are JET (Europe), TFTR (USA), and JT60 (Japan). The parameters of these three machines have been chosen with different scientific objectives in mind; these will be outlined and compared. The performance to be expected in these machines in the light of our best present knowledge will be discussed. The information to be expected from these machines on the key issues of containment, impurities, plasma beta and alpha-particle effects will be outlined. Finally, we relate this to the requirements of the on-going programme in particular to the design and construction of the next generation, the tritium burners.

58979 (EUR—6584(Vol.2), pp 779-794) **Alternate concepts and new experiments in existing devices for the investigation of thermonuclear regimes.** Clarke, J.F. (Office of Fusion Energy, Washington, D.C., USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Fusion reactors can ignite with a range of electron and ion temperatures and energy confinement times. The characteristics of ignited reactors will depend on these factors as well as the fuel used. Hot ion mode operation, which is the natural ignited state of a tokamak, leads to enhanced possibilities for utilization of the deuterium-deuterium fuel cycle and achievement of an attractive reactor. These reactors give new scope for application of modern plasma physics.

58980 (EUR—6584(Vol.2), pp 795-803) **Alternate concepts for magnetic fusion.** Nelson, D.B. (Office of Fusion Energy, Washington, USA). 1979. NTIS (US Sales Only), PC A18/MF A01.

From International school of plasma physics course and workshop; Varenna, Italy (28 Aug 1979).

Concepts for magnetic confinement are reviewed for desirability as fusion reactors. Physics and technology advantages, uncertainties, and problems are discussed. Alternate fuel cycles, including D-D, D-He^3, and p-Li^6, are considered for possible advantages over D-T. Concepts currently under investigation which offer potential improvement over tokamaks include tandem mirrors, Elmo Bumpy Torus, compact tori encompassing reversed field mirrors, reversed field theta pinches and spheromak, stellarators, multipoles, and reversed field Z pinches.

58981 **(EUR-CEA-FC—1106) Theoretical study of the attenuation of a gaussian beam penetrating into a dielectric circular wave guide.** Crenn, J.P. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Recherches sur la Fusion Controlee). Jul 1981. 45p. (In French). NTIS (US Sales Only), PC A03/MF A01.

It is proposed to draw up an approximate formula directly giving the attenuation of a gaussian beam penetrating into a superdimensioned dielectric circular wave guide. This formula is derived from optical laws, i.e. Fresnel's formulae of the reflexion of a wave on a dielectric to which a correcting term due to diffraction has been added. The results given by this formula are compared with the existing results, based on the breakdown of a gaussian beam into propagation modes, thereby enabling their validity and the field of use to be checked. An application is then made to the wave guides that will be employed in the infrared interferometer fitted in JET.

58982 **(EUR-CEA-FC—1115) Antennas of ion cyclotron heating installed in the TFR Tokamak. General characteristics, and coupling properties.** (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Groupe de Recherches sur la Fusion Controlee). Sep 1981. 56p. (In French). NTIS (US Sales Only), PC A04/MF A01. Order Number DE82701975.

We describe and discuss the properties of two kinds of antenna installed in the TFR Tokamak. The first type of antenna is an array of 8 narrow radiating elements which could transfer 2 MW to the plasma. The second type is made of two much wider radiating elements located on the low field side of the Tokamak. Particular emphasis is given to the measurements of the coupling properties as a function of magnetic field, density, gas composition, frequency and distance between the antenna and the plasma. Both toroidal and radial eigen mode are clearly observed. They appear as a fast toroidal modes or slow radial modes variation of the loading resistance when the plasma density changes. Theses fluctuations disappear when a strong damping mechanism is established: hydrogen-deuterium hybrid resonance or second harmonic hydrogen resonance. The conditions of appearance of radial eigen-modes are found to agree precisely with the magnetosomic wave resonance. Current theory also correctly predicts the variation of the loading resistance with the distance between the antenna and the plasma. A rapid increase of the loading resistance with frequency is observed. The effect could not be related to the predictions of coupling theories.

58983 **(ILE—7902P) Self-generated magnetic field in CO_2 laser produced plasma.** Kitagawa, Y.; Thein, A.; Yamada, Y.; Yokoyama, M.; Yamanaka, C. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 23 Jul 1979. 16p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702499.

Measurements have been made of an azimuthal magnetic field spontaneously associated with plasmas produced by the irradiation of an 80 ns CO_2 laser pulse to a CD_2 target. The magnetic field diffuses from an initial source into an ambient nitrogen plasma. Extrapolation of measured data to the initial target surface shows a field intensity of ~0.6 MG. The diffusion coefficient calculated from the ambient plasma parameters is in accordance with direct experimental data. The diffused field is followed by the expanding laser target plasma. For sufficiently high ambient gas pressure, the field direction is reversed.

58984 **(ILE—7907P) Computer simulation of nonlinear propagation characteristics of CO_2 laser pulse.** Daido, H.; Okehara, J.; Ido, S.; Matobe, M.; Nakai, S. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 19 Oct 1979. 27p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702500.

The characteristics of a pulse propagation through the CO_2 laser system LEKKO PI are analysed numerically using MELCOM COSMO 700 PI digital computer. The amplifiers are treated as Frantz and Nodvik type rate equation model and the SF_6 saturable absorbers are treated as phenomenological model based on the measurement of energy transmission. The computed results are compared with the observed data of the pulse energy, the rise time of pulse and the pulse duration (FWHM). It is found that the pulse peak delays in case of relatively small incident pulse energy due to the nonlinear absorption characteristics of SF_6 and it proceed effectively in case of relatively large incident pulse energy due to the nonlinear amplification characteristics of CO_2 lasers. The multi-line amplification code is developed. The effect of the double band and the multi-line energy extraction and the ratio of the pulse energy in individual rotational line to whole pulse energy after passing through the laser amplifier are discussed.

58985 **(ILE—7914P) Recent thin foil target experiments on Reiden III.** Imasaki, K.; Miyamoto, S.; Higaki, S.; Ozaki, T.; Nakai, S. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 7 Feb 1980. 19p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702501.

The dynamic behaviors of a blow-off plasma of a thin layered target were observed optically by shadowgraphy and interferometry. The results were explained by using ablative and explosive models. Experimental evidence of highly efficient beam coupling which induces hydrodynamic drive of plasma is presented.

58986 **(ILE—8002P) Computational study on light ion beam fusion.** Ido, S.; Higaki, S.; Yabe, T.; Imasaki, K.; Nakai, S. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 16 Feb 1980. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702502.

One dimensional computational study on pellet implosion, ignition and burn by light ion beam is presented. The effects of thickness of Au shell or tamper and fuel mass are investigated and breakeven condition is examined for 100TW, 10MeV, 2MJ proton beam.

58987 **(ILE—8004P) Effects of thermal conduction and compressibility on Rayleigh-Taylor instability.** Takabe, H.; Mima, K. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 28 Feb 1980. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702503.

In order to study the stability of the ablation front in laser driven implosion, the thermal conduction and compressibility effects on the Rayleigh-Taylor instability are considered. It is found that the thermal conduction effect cannot stabilize the Rayleigh-Taylor mode, but reduce the growth rate in the short wavelength case. But, the growth rate is found not to differ from the classical value $\sqrt{gk}$ in the long wavelength limit, where the compressibility is essential.

58988 **(ILE—8005P) Ion beam generation on Reiden III.** Miyamoto, S.; Imasaki, K.; Higaki, S.; Ozaki, T.; Nakai, S. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 8 Mar 1980. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702504.

A high power pulse generator Reiden III has been used to produce light ion beams. Currents in excess of 2 kA with current density greater than 50 A/cm^2 have been produced in a 100 ns bursts at energy 200 keV using a pinched REB diode. Experiments of magnetic insulation ion diode were begun for generation of protons.

58989 **(ILE—8012P) Investigation of implosion symmetry and stability by time-resolved x-ray shadowgraphy.** Mochizuki, T.; Yabe, T.; Azechi, H.; Okada, K.; Yamanaka, C. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 17 Jul 1980. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702506.

A strong dependence of implosion symmetry on laser focusing conditions and a growth of a whisker-like irregularity on ablation surface were observed in ablatively compressed laser fusion pellets by using time-resolved x-ray shadowgraphy. The time development of the implosion nonuniformity was traced by a 2-D fluid PIC code. The simulation result supports a hydrodynamic "free-falling" effect on the growing irregularity, which explains well the experimental results quantitatively within a factor of 2.

58990 **(ILE—8016P) Neutronics in pellets of inertial confinement fusion.** Ido, S.; Hattori, K.; Kodaira, H.; Kondo, S.; Nakai, S. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 10 Dec 1980. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702508.

One dimensional neutron transport calculations were carried out for high density DT pellets by ANISN-JR code and the nuclear data GICX-40. When rhoR becomes larger than 1 g/cm^2, neutron spectrum is evidently softened and the limitation on the design of ICF reactors is relaxed. Softened neutron spectra from bare DT targets with rhoR = 0.7, 3.0 and 6.0 g/cm^2 are presented. Neutron spectra from DT targets of rhoR = 3.0 g/cm^2 with a Pb tamper, a CH_2 foam and a Pb pusher are also presented. A Pb tamper and a Pb pusher multiply neutrons from a pellet. A CH_2 foam sufficiently moderates energetic neutrons.

58991 **(ILE—8018P) Studies on implosion efficiency in LIB driven implosion.** Higaki, S.; Imasaki, K.; Ido, S.; Nakai, S.; Yamanaka, C. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 10 Dec 1980. 10p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702509.

One dimensional computational studies on implosion efficiency in LIB driven implosion is presented. The highest implosion efficiency of 0.17 can be obtained by 10 MeV proton beam.

58992 **(IPPJ—502) Simulation for implosion of hollow shell target bombarded by proton beam.** Kawata, S.; Niu, K. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Feb 1981. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701982.

A newly developed one-dimensional hydrodynamic code "Mt. FUJI" is used to simulate the implosion motion of a hollow shell target. The code includes special processes occurring in the target such as fuel depletion caused by fusion reactions and reabsorption of neutrons, α-particles and photons which are produced in the target, as well as the ordinary processes, for instance, depositions of energy, momentum and mass of impinging light ion beams. The simulation shows that a pellet gain of more than 90 can be attainable in an adiabatic compression of the fuel provided that the pellet has the optimum amount of D-T fuel and the fuel velocity exceeds 10^7 cm/sec at the pellet implosion.

58993 **(IPPJ—503) Overview of neutral beam injector technology developments at universities.** Miyahara, A. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Feb 1981. 26p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82701983.

Activities of universities on the neutral beam injector developments have been overviewed. The subjects consist of NBI construction, components developments and system analyses, which are intensively studied at universities. Although neutral beam injector technologies are present day top topics, however, still a lot of efforts with flexible ideas are necessary to realize reactor relevant neutral beam injector system.

58994 **(IPPJ—508) Deflagration wave with radiative energy transport.** Tamba, M.; Niu, K. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Feb 1981. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701985.

Numerical calculations are carried out to analyze spatial structures of stationary deflagration waves formed in slab targets. In the analysis, radiative energy transport is taken into account. Profiles of radiative energy flux differ depending on the states of the outer-layer material of the target (solid or plasma). However radiative energy transport plays a negligible role in deflagration-wave structures formed by light-ion beam.

58995 **(IPPJ—518) Ablation acceleration of macroparticle in spiral magnetic fields.** Ikuta, K. (Nagoya Univ. (Japan). Inst. of Plasma Physics). May 1981. 15p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702510.

The rocket motion of macroparticles heated by energetic pulses in a spiral magnetic field was studied. The purpose of the present work is to study the ablation acceleration of a macroparticle in a spiral magnetic field with the help of the law of conservation of angular momentum. The basic equation of motion of ablatively accelerated projectile in a spiral magnetic field was derived. Any rocket which is ejecting fully ionized plasma in an intense magnetic field with rotational transform is able to have spin by the law of conservation of momentum. The effect of spiral magnetic field on macroparticle acceleration is discussed. The necessary mass ratio increase exponentially with respect to the field parameter. The spiral field should be employed with care to have only to stabilize the position of macroparticles. As conclusion, it can be said that the ablation acceleration of the projectile in a spiral field can give the accelerated body spin quite easily.

58996 **(IPPJ—524) Observation of lower hybrid current drive in the JIPP T-II torus.** Ohkubo, K.; Takamura, S.; Kawahata, K.; Tetsuka, T.; Matsuura, K. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Jun 1981. 33p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702263.

A toroidal current driven by the lower hybrid wave has been observed in low density plasmas in the JIPP T-II. It is confirmed that rf-driven current is generated by momentum transfer of the lower hybrid waves to suprathermal electrons with the energy of 8 - 25 keV. The driving efficiencies in tokamak and stellarator configurations are 1 kA/kW and 0.3 kA/kW at the power level of 40 kW, respectively. Electron cyclotron emission measured by changing the receiving frequency indicates that the current profile driven by rf is hollow. Enhanced electron cyclotron emission due to the pitch-angle scattering of rf-driven runaway electrons is observed, and spikes in loop voltage and X-ray bursts appear coincidentally. In a long rf pulse, these rapid changes advance to relaxation oscillations. It is concluded that the pulsating changes originate in the instantaneous scattering of rf-driven runaway electrons by the unstable waves excited at an anomalous Doppler resonance.

58997 **(IPPJ—525) Magnetic configuration of twin tori for a new bundle divertor.** Ikuta, K. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Jun 1981. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701992.

The system of twin tori is numerically studied in detail in order to have diverted flux surface without intersecting chamber wall. The key parameters of practical twin tori are found to be both the number and the shape of the toroidal field coils. Typical examples of coil system are also shown.

58998 **(IPPJ—526) Field reversal by rotating waves.** Fisch, N.J.; Watanabe, T. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Jun 1981. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701993.

Rotating waves have been suggested as a means of generating currents that, in turn, can produce a compact torus configuration. The practicality of this scheme is assessed with regard to stability and power requirements. The method of generating current is compared to other methods of non-Ohmic current-drive.

58999 **(IPPJ—541) Plasma focus breeder.** Ikuta, K. (Nagoya Univ. (Japan)). Sep 1981. 15p. NTIS, PC A02/MF A01.

High voltage generation on pinched plasma by a plasma focus device was investigated. Fissile fuels are bred with the help of high current plasma focus device. A mechanism of accelerating proton beam in plasma focus device to high energy changes the inductance in plasma column because of rapid growth of plasma instability. It is concluded that a high current plasma focus device is a good candidate for the generation of energetic, intense proton beams which can be utilized for breeding fissile fuels.

59000 **(IPPJ—542) Feedback plasma control in hybrid poloidal coil system.** Hamada, Y.; Abe, Y.; Kitagawa, S.; Toi, K. (Nagoya Univ. (Japan)). Sep 1981. 25p. NTIS, PC A02/MF A01.

Analysis of feedback control characteristics in the hybrid poloidal coil system (hybrid of the ohmic and the equilibrium vertical coils) is performed. It is found that, in the complex hybrid poloidal coil system, the plasma can be sufficiently well controlled using very simple equations for the calculation of feedback voltage.

59001 **(IPPJ-DT—84) Design and construction of a horizontally placed superconducting magnet and its cryostat for an electron beam ion source.** Kobayashi, N.; Ohtani, S.; Kaneko, Y.; Iwai, T.; Okuno, K. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Mar 1981. 36p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82701995.

An electron beam ion source nicknamed NICE-I (Naked Ion Collision Experiments) has been constructed at IPP for studies of atomic processes in fusion plasmas. A super conducting magnet is adopted to generate a strong, stable and homogenious magnetic field to compress a high density electron beam. The solenoid is 1 m long, the inner diameter is 100 mm and the maximum magnetic field is 2T. It is placed horizontally and coaxially with a liquid nitrogen (L-N$_2$) reservoir and a vaccum vessel. In order to fix their axes inmovable even when the reservoirs are cooled by L-N$_2$ and He, a structure having spokes strained uniformly like a wheel is used between the vaccum vessel and the L-N$_2$ reservoir and also between the L-N$_2$ reservoir and the solenoid bore. The electrodes, such as the electron gun, the drift tubes and so on, are mounted on the radiation shields fixed on the L-N$_2$ reservoir, and they are centered to the solenoid bore within the precision of 0.1 mm. The evapolation rate of L-He is about 1.4 l/h, which is not so much larger than the estimated value. This provides a continuous operation for 16 hours with a charge of 50 l L-He including the precooling of the reservoir. The ultimate pressure 4×10^{-10} Torr is achived in the vacuum vessel, and the residual gas pressure in the ionization region is expected to be much lower than 1×10^{-10} Torr. The consideration for mechanical strength and the heat conduction of the materials related to the design are described as well as the details of the structure.

59002 **(IPPJ-T—33) Test stand for magnetron H$^-$ ion source at IPP-Nagoya.** Okamura, H.; Kuroda, T.; Miyahara, A. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Feb 1981. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701996.

The test facilities for the development of magnetron H$^-$ ion source are described putting stress upon their electronics.

59003 **(JAERI-M—9443) Indirectly heated cathode for the ion source of neutral beam injector.** Tanaka, S.; Arakawa, Y. (Japan Atomic Energy Research Inst., Tokyo). Apr 1981. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701997.

An indirectly heated cathode made of impregnated porous tungsten emitter was prepared for the ion source of neutral beam injector. The cathode was applied to a duoPIGatron hydrogen ion source, where discharge characteristics and the cathode life time were tested. Beam extraction from the source was also carried out. The accumulated discharge time of the cathode was over 20 hours which corresponds to a life time of 2 months for normal use, and the cathode was still usable after the test.

59004 **(JAERI-M—9470) Helium compression and enrichment with poloidal divertor. Doublet-III experimental report, 7.** Shimada, M.; Nagami, M.; Ioki, K. (Japan Atomic Energy Research Inst., Tokyo). Apr 1981. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE82701999.

The helium ash enrichment function of a divertor has been experimentally demonstrated. Helium atoms accumulate in the divertor region, as the electron density of main plasma increases. With a helium allowance of 1% of electron density in the main plasma, neutral helium at the divertor region is as high as 3.6×10^{-5} Torr. A factor of 2.4 helium enrichment in the divertor region was also observed. This experiment indicates the possibility of helium ash exhaust in an alpha-heated, diverted tokamak using practical-sized pumping ducts.

59005 **(JAERI-M—9517) Charge accumulation in insulators of poloical field coils due to x-ray irradiation.** Tanaka, R.; Sunaga, H.; Tamura, N.; Ando, T.; Ieda, M.; Kadotani, K. (Japan Atomic Energy Research Inst., Tokyo). Jun 1981. 47p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702000.

The behavior of excess charge accumulation in the insulators of the poloidal field coils of the JT-60 (critical plasma facility) when exposed to hard X-rays produced on runaway discharge was estimated mainly by calculations. The continuity and Poisson's simultaneous equations concerning the excess charge were solved based on estimating the distributions of absorbed dose rate and excess charge deposition rate in the insulator (epoxy resin) under the irradiating condition assumed in the JT-60 and on measured radiation induced conductivity in the insulator under and after irradiation. Under the most severe irradiating condition, calculated values of electric field strength at the surface of the insulator exceeds 5 MV/cm after about 20th ranaway discharge (duration time : 5 sec per on discharge), and the saturation value exceeds 10 MV/cm. Since the delayed conductivity is very small, the charge leakage for the time interval between discharges influences the saturated value very little. We consider that local dielectric breakdowns may occur near the surface of the insulator, but it dose not propagate into deeper region owing to the non-uniform field. The relation between X-ray induced current under irradiation and inner electric field was also examined.

59006 **(JAERI-M—9539) Thermal stress analysis on the extraction grid. Exit grid for JT-60 NBI.** Shibanuma, K.; Kuriyama, M.; Ohara, Y.; Okumura, Y. (Japan Atomic Energy Research Inst., Tokyo). Jun 1981. 25p. (In Japanese). NTIS (US Sales Only), PC A02/MF A01. Order Number DE82702001.

The ion sources of the neutral beam injectors for JT-60 are required to produce stable ion beam of 50 -- 100 keV, 35 -- 40 A for a long pulse length of up to 10 sec. This long pulse operation at high power level causes several difficult problems. One of the problems is the thermal stress in the extraction grids. In this report, a thermal stress analysis method using finit element method has been applied to the exit grid, which is subjected to a relatively large and one-side heat loading. Oxygen-free copper and molybdenum are considered as caudidate materials of the grid for this numerical analysis. Results are evaluated according to the ASME-Sec.III Code. The stress in copper grid is extremely larger than the allowable value all over the multi-aperture region. Therefore, the design of copper grid must be fundamentally reconsidered. On the other hand, the stress in molybdenum grid is shightly over the allowable value only at two corners of the multi-aperture region. A small structural improvement in this grid enables us to suppress the stress below the allowable value.

59007 **(JAERI-M—9577) Physical design considerations of the next tokamak fusion reactor. Parameter survey of the device size.** Fujisawa, N.; Sugihara, M. (Japan Atomic Energy Research Inst., Tokyo). Jul 1981. 31p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702002.

Wide range of parameter surveys on the next device to JT-60 are made. Various physical and engineering requirements are taken into account, e.g., self-ignition, available maximum beta value, total fusion power, neutron wall loading, α-particle confinement, heat flux to divertor plate, structural restriction on aspect ratio, device size, maximum toroidal magnetic field and so on. Since the energy confinement scaling law has ambiguities, emphases are placed on the methodology to determine the plasma and device parameters realizing the various objectives of the next device.

59008 **(KFTI—81-44) Magnetic field components of helical conductors with a current on a torus.** Kalyuzhnyj, V.N.; Nemov, V.V. (AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.). 1981. 31p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702512.

Using the Biot-Savart low the formulae for components of a vacuum magnetic field, generated by a current of helical conductors located on a torus surface at an arbitrary winding pitch with regard to possible modulation of the winding angle, are obtained. The expressions obtained having the form of power series expansions of the distance from the circular torus axis can be used in analytical studies of magnetic configurations of stellarator-type traps.

59009 (KFTI—81-45) **Main physical problems of "Uragan-3" device.** Volkov, E.D.; Georgievskij, A.V.; Dikij, A.G.; Loginov, A.S.; Suprunenko, V.A.; Tolok, V.T.; Shvets, O.M.; Yuferov, V.B. (AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.). 1981. 28p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702007.

The present state of investigations on plasma thermal insulation, confinement and equilibrium in stellarators is analyzed. The ways for further development of studies are outlined. The main parameters and description of the design of a new fusion installation - the "Uragan-3" torsatron with a divertor are presented. The program of investigations on the installation is discussed.

59010 (LA—9383-MS) **Tritium-gas/water-vapor monitor. Tests and evaluation.** Jalbert, R.A. (Los Alamos National Lab., NM (USA)). Jul 1982. Contract W-7405-ENG-36. 8p. NTIS, PC A02/MF A01. Order Number DE82019706.

A tritium gas/water-vapor monitor was designed and built by the Health Physics Group at the Los Alamos National Laboratory. In its prototype configuration, the monitor took the shape of two separate instruments: a (total) tritium monitor and a water-vapor monitor. Both instruments were tested and evaluated. The tests of the (total) tritium monitor, basically an improved version of the standard flow-through ion-chamber instrument, are briefly reported here and more completely elsewhere. The tests of the water-vapor monitor indicated that the novel approach used to condense water vapor for scintillation counting has a number of serious drawbacks and that further development of the instrument is unwarranted.

59011 (LA-UR—82-1192) **US program in heavy-ion fusion.** Bangerter, R.O. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 17p. (CONF-820338—8). NTIS, PC A02/MF A01. Order Number DE82015769.

From Symposium on accelerator aspects of ion fusion; Darmstadt, F.R. Germany (29 Mar 1982).

Portions of document are illegible.

A national plan for heavy ion fusion research is outlined. The transfer of the heavy ion fusion program from the Defense Programs to the Office of Energy Research is discussed. (MOW)

59012 (LA-UR—82-1973) **Identification of future engineering-development needs of alternative concepts for magnetic-fusion energy.** Krakowski, R.A. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 39p. (CONF-820838—1). NTIS, PC A03/MF A01. Order Number DE82019566.

From Future engineering development needs for magnetic fusion workshop; Washington, DC, USA (3 Aug 1982).

A qualitative identification of future engineering needs of alternative fusion concepts (AFCs) is presented. These needs are assessed relative to the similar needs of the tokamak in order to emphasize differences in required technology with respect to the well documented mainline approach. Although nearly thirty AFCs can be identified as being associated with some level of reactor projection, redirection, refocusing, and general similarities can be used to generate a reduced AFC list that includes only the bumpy tori, stellarators, reversed-field pinches, and compact toroids. Furthermore, each AFC has the potential of operating as a conventional (low power density, superconducting magnets) or a compact, high-power-density (HPD) system. Hence, in order to make tractable an otherwise difficult task, the future engineering needs for the AFCs are addressed here for conventional versus compact approaches, with the latter being treated as a generic class and the former being composed of bumpy tori, stellarators, reversed-field pinches, and compact toroids.

59013 (LA-UR—82-2148) **Compact reversed-field pinch reactor (CRFPR): a high-density approach to magnetic fusion energy.** Hagenson, R.L.; Krakowski, R.A.; Byrne, R.N.; Dobrott, D. (Los Alamos National Lab., NM (USA); Technology International, Inc., Ames, IA (USA); Science Applications, Inc., La Jolla, CA (USA)). 1982. Contract W-7405-ENG-36. 12p. (CONF-820930—1). NTIS, PC A02/MF A01. Order Number DE82018106.

From 9. international conference on plasma physics and controlled nulcear fusion research; Baltimore, MD, USA (1 Sep 1982).

Because of the unique magnetic topology associated with the Reversed-Field Pinch (RFP), the compact reactor embodiment for this approach is particularly attractive from the viewpoint of low-field resistive coils operating with Ohmic losses that can be made small relative to the fusion power. The cost-optimized Compact RFP Reactor (CRFPR) design would operate with fusion-power-core power densities and mass utilizations that are comparable to fission power plants and are an order of magnitude more favorable than the conventional fusion approaches. A comprehensive system model predicts the CRFPR point design to be surprisingly resilient to changes in key, but relatively unknown, physics and systems parameters.

59014 (NASA-CR—168848) **Proceedings of the second international colloquium on drops and bubbles.** Lecroissette, D.H. (Jet Propulsion Lab., Pasadena, CA (USA)). Mar 1982. 400p. (JPL-PUB—82-7; CONF-811174—). NTIS, PC A17/MF A01.

From 2. convention of the international colloquium on drops and bubbles; Monterey, CA, USA (19 Nov 1981).

Applications of bubble and drop technologies are discussed and include: low gravity manufacturing, containerless melts, microballoon fabrication, ink printers, laser fusion targets, generation of organic glass and metal shells, and space processing. The fluid dynamics of bubbles and drops were examined. Thermomigration, capillary flow, and interfacial tension are discussed. Techniques for drop control are presented and include drop size control and drop shape control. For individual titles, see N82-23419 through N82-23469.

59015 (NASA-CR—168848, pp 1-6) **Drops and bubble in materials science.** Doremus, R.H. Mar 1982. NTIS, PC A17/MF A01.

From 2. convention of the international colloquium on drops and bubbles; Monterey, CA, USA (19 Nov 1981).

The formation of extended p-n junctions in semiconductors by drop migration, mechanisms and morphologies of migrating drops and bubbles in solids and nucleation and corrections to the Volmer-Weber equations are discussed. Bubble shrinkage in the processing of glass, the formation of glass microshells as laser-fusion targets, and radiation-induced voids in nuclear reactors were examined.

59016 (NASA-CR—168848, pp 96-106) **Behavior of liquid hydrogen inside an ICF target.** Kim, K.; Mok, L.; Bernat, T. Mar 1982. NTIS, PC A17/MF A01.

From 2. convention of the international colloquium on drops and bubbles; Monterey, CA, USA (19 Nov 1981).

The configuration of liquid hydrogen inside spherical glass shell ICF target was studied both theoretically and experimentally. Because of the zero contact angle between the .D2 liquid and glass substrate and the limited wetting surface that is continuous, the liquid hydrogen completely covers the interior of the glass shell, resulting in the formation of a void at the center. For this reason, the present problem distinguishes itself from that for a sessile drop sitting on a flat surface. A theory was formulated to calculate the liquid hydrogen configuration by including the London-dispersion force between the liquid and the substrate molecules. The net result is an augmented Bashforth-Adams equation appropriate to a spherical substrate, which is considered to be the major contribution of the present work. Preliminary calculations indicate that this equation accurately models the liquid hydrogen behavior inside a spherical microshell.

59017 (NASA-CR—168848, pp 107-111) **Generation of a strong core centering force in a submillimeter compound droplet system.** Lee, M.C.; Feng, I.A.; Elleman, D.D.; Wang, T.G.; Young, A.T. (LASL). Mar 1982. NTIS, PC A17/MF A01.

From 2. convention of the international colloquium on drops and bubbles; Monterey, CA, USA (19 Nov 1981).

By amplitude-modulating the driving voltage of an acoustic levitating apparatus, a strong core centering force was generated in a submillimeter compound droplet system suspended by the radiation pressure in a gaseous medium. Depending on the acoustic characteristics of the droplet system, it was found that the technique can be utilized advantageously in the multiple-layer coating of an inertial confinement fusion pellet.

59018 (ORNL/Sub—79/21453/7) **60 GHz gyrotron development program. Quarterly report No. 7, January-March 1981.** Shively, J.F.; Evers, S.J.; Evans, S.J.; Stone, D.S. (Oak Ridge National Lab., TN (USA); Varian Associates, Palo Alto, CA (USA). Palo Alto Microwave Tube Div.). 1981. Contract W-7405-ENG-26. 45p. NTIS, PC A03/MF A01. Order Number DE82005760.

Portions of document are illegible.

The objective of this program is to develop a microwave oscillator capable of producing 200 kW of CW power at 60 GHz. The use of cyclotron resonance interaction is being pursued. The design, early construction, and test phases are discussed. A peak output power of over 200 kW was obtained with over 50% efficiency at pulse durations of 20 μs.

59019 (ORNL/Sub—79/21453/S1) **60-GHz gyrotron development program alternate frequency study.** Evans, S.J.; Nordquist, A.L.; Wendell, G.E. (Oak Ridge National Lab., TN (USA); Varian Associates, Palo Alto, CA (USA). Palo Alto Microwave Tube Div.). Aug 1981. Contract W-7405-ENG-26. 20p. NTIS, PC A02/MF A01. Order Number DE82005761.

The purpose of this study was to take a preliminary look at what the considerations are when scaling the frequency of a gyrotron oscillator a few percent from an existing design. To minimize construction costs, it would be most advantageous to keep all parts the same and operate only with slightly different voltages and magnetic fields. There are two tube parts that must be changed for any frequency modification: the tube output window and the oscillation cavity. This study assumed that the output window and the cavity would be scaled in dimensions for best operation at the new frequency. The main thrust of the study was to examine the feasibility of using the 60 GHz gun (K-8060) and magnet (VYW-8060) for operation at 56 and 52 GHz, and the 28 GHz gun (K-8000) and magnet (VYW-8000) for operation at 26 and 30 GHz. All work was done using Varian computer gun codes and hand calculations. It must be mentioned that these results are only a guideline and that a final design would need some further fine tuning.

59020 (PPPL—1901) **Optimum shapes for pump limiters.** Ulrickson, M. (Princeton Univ., NJ (USA). Plasma Physics Lab.). May 1982. Contract AC02-76CH03073. 23p. NTIS, PC A02/MF A01. Order Number DE82014978.

The design of a pump limiter depends strongly on the details of the plasma scrapeoff zone. A model has been developed which allows the transport coefficients in the scrapeoff to be functions of n and t. This model has been used to predict scrapeoff profiles for FED/INTOR. The profiles are used to find and analyze limiter profiles. The results suggest the use of limiter shapes which curve toward the plasma.

59021 (PPPL—1923) **Hyperbolic-secant mode coupling.** Doane, J.L. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Jul 1982. Contract AC02-76CH03073. 31p. NTIS, PC A03/MF A01. Order Number DE82020260.

This work presents a new solution of the coupled mode equations for a hyperbolic secant spatial variation of the coupling between two modes. An analytic expression is given for the transmission coefficient for arbitrary complex differential propagation constant and coupling strength. The expression is particularly simple in the case when the differential attenuation between the modes is negligible. Design curves are presented in terms of normalized parameters. The hyperbolic secant coupling may be truncated and still yield virtually the same transmission as for infinite coupling length. The required coupling length is indicated by a comparison of the ideal expression with the results of numerical integration of the coupled mode equations. Hyperbolic secant coupling can be particularly useful for the design of low-loss bends and twists in overmoded waveguide.

59022 (TRITA-PFU—82-02) **Temperature gradient effects on the neutral gas penetration into a magnetized plasma.** Bures, M. (Stockholm Univ. (Sweden). Fysiska Institutionen). Jan 1982. 36p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702514.

The experimental evidence of temperature gradient effects on the neutral gas penetration into plasma is presented. It is found that an increased temperature gradient reduces the neutral gas content in the partially ionized boundary layer of a cold gas blanket system. A strong modification of the rotation plasma equilibrium is then observed. Such an equilibrium is a sensitive function of the neutral gas concentration both in the plasma in its boundary layers. The moderate values of the centrifugal force with act both on the ions and neutrals do not appreciably influence the plasma permeability to neutral gas. It is further observed that an acceleration of neutrals has to take in a rotating plasma.

59023 (UCRL—53263) **FORIG: a modification of the ORIGEN2 isotope-generation and depletion code for fusion problems.** Blink, J.A. (Lawrence Livermore National Lab., CA (USA)). 3 Mar 1982. Contract W-7405-ENG-48. 12p. NTIS (US Sales Only). Order Number DE82016133.

Portions of document are illegible.

This report describes how to use the FORIG computer code to solve isotope-generation and depletion problems in fusion and fission reactors. FORIG is an adaptation of ORIGEN2 to run on a Cray-1 computer, and to accept more extensive activation cross sections.

59024 (UCRL—86029) **Development of a high-density energy-storage capacitor for Nova.** Haskell, D.K.; Cooper, R.A.; Sevigny, J.A.; Merritt, B.T.; Carder, B.M.; Whitham, K. (Lawrence Livermore National Lab., CA (USA); Maxwell Labs., Inc., San Diego, CA (USA)). 22 Oct 1981. Contract W-7405-ENG-48. 6p. (CONF-811040—146). NTIS, PC A02/MF A01. Order Number DE82006772.

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Portions of document are illegible.

This paper covers Maxwell's approach to developing energy storage capacitors. Based on previous capacitor designs of 3 KJ, 5 KJ and 10 KJ, the final Nova 12.5 KJ capacitor evolved. At the outset of the Nova capacitor development program, a relatively new dielectric system, polypropylene-paper-DOP, seemed to show superiority in volumetric efficiency, life, and more importantly cost. However, as a result of studies performed at Maxwell, a high-density, energy-storage capacitor was developed utilizing new high-quality, high-density paper and caster oil as the dielectric. Test data have demonstrated that the Maxwell 12.5 KJ capacitor exceeds all LLNL's qualification requirements.

59025 (UCRL—87114) **Lawrence Livermore National Laboratory laser-fusion program.** Ahlstrom, H.G. (Lawrence Livermore National Lab., CA (USA)). 12 Jul 1982. Contract W-7405-ENG-48. 42p. (CONF-820930—5). NTIS, PC A03/MF A01. Order Number DE82020167.

From 9. international conference on plasma physics and controlled nulcear fusion research; Baltimore, MD, USA (1 Sep 1982).

The goals of the Laser-Fusion Program at Lawrence Livermore National Laboratory are to produce well-diagnosed, high-gain, laser-driven fusion explosions in the laboratory and to exploit this capability for both military applications and for civilian energy production. In the past year we have made significant progress both theoretically and experimentally in our understanding of the laser interaction with both directly coupled and radiation-driven implosion targets and their implosion dynamics. We have made significant developments in fabricating the target structures. Data from the target experiments are producing important near-term physics results. We have also continued to develop attractive reactor concepts which illustrate ICF's potential as an energy producer.

59026 **(UCRL—87749) Future engineering needs of mirror fusion reactors.** Thomassen, K.I. (Lawrence Livermore National Lab., CA (USA)). 30 Jul 1982. Contract W-7405-ENG-48. 25p. (CONF-820838—2). NTIS, PC A02/MF A01. Order Number DE82019434.

From Future engineering development needs for magnetic fusion workshop; Washington, DC, USA (3 Aug 1982).

Fusion research has matured during the last decade and significant insight into the future program needs has emerged. While some will properly note that the crystal ball is cloudy, it is equally important to note that the shape and outline of our course is discernable. In this short summary paper, I will draw upon the National Mirror Program Plan for mirror projects and on available design studies of these projects to put the specific needs of the mirror program in perspective.

59027 **(UCRL—87779) Electron energy distributions, vibrational population distributions, and negative-ion concentrations in hydrogen discharges.** Hiskes, J.R.; Karo, A.M. (Lawrence Livermore National Lab., CA (USA)). 28 Jun 1982. Contract W-7405-ENG-48. 31p. (CONF-820731—1). NTIS, PC A03/MF A01. Order Number DE82019313.

From North Atlantic Treaty Organization Advanced Study Institute conference on atomic and molecular processes in controlled thermonuclear research; Palermo, Italy (19 Jul 1982).

We consider the negative ion concentrations in hydrogen discharges caused by electron excitation and dissociative attachment processes. The principal formation and destruction processes are discussed for electron densities in the range 10^8 to 10^{13} electrons cm^{-3}. Expressions are developed for calculating the high energy portion of the electron energy distribution in the discharge; using these energy distributions the electron excitation rates are evaluated. At low densities, the vibrational distribution arises from singlet electronic excitations and triplet excitations through the $^3\pi$/sub u/ state, in equilibrium with wall de-excitation processes. At high densities singlet excitations predominate in equilibrium with atom-molecule de-excitation processes. Possibilities for negative ion generation in a two-chamber tandem system are discussed in which the vibrational excitation occurs in a high power, high electron temperature discharge, kT/sub e/ = 5 eV, and dissociative attachment occurs in a low temperature kT/sub e/ = 1 eV, plasma chamber.

59028 **(UCRL—87803) Time-dependent Stark-broadening measurements in planar-laser target experiments.** Lee, R.W.; Kilkenny, J.D.; Kauffman, R.L.; Matthews, D.L. (Lawrence Livermore National Lab., CA (USA); Imperial Coll. of Science and Technology, London (UK)). 9 Jul 1982. Contract W-7405-ENG-48. 20p. (CONF-820732—1). NTIS, PC A02/MF A01. Order Number DE82019117.

From International union of pure and applied physics conference; Boulder, CO, USA (12 Jul 1982).

Recent experiments at the Rutherford Laboratory Central Laser Facility using a single beam frequency doubled neodymium glass laser irradiating an assortment of planar targets are described. We have measured the time dependent Stark broadening of the AL XIII Lyman series lines using a streaked x-ray crystal spectrograph with a temporal resolution of 80 ps. We analyzed the results using standard line broadening theory which is presented for the high lying Lyman lines. The comparison between the time integrated and time dependent spectral lines will be presented. The results illustrate the possibilities now available for characterization of planar target plasmas.

59029 **(UTIAS—251) Gas target neutron generator studies.** Chatoorgoon, V. (Toronto Univ., Ontario (Canada)). Oct 1981. 152p. NTIS, PC A08/MF A01.

Heat deposition in a subsonic flow can cause the formation of gas density gradients which constitute useful gas targets. The variation of beam voltage, gas density, gas pressure, gas temperature, etc., within a subsonic channel were calculated as a function of the system parameters: beam voltage, beam current, channel diameter, stagnation tank temperatue and pressure. The analysis is presented as applicable to any combination of beam particle and target gas. It was found that the subsonic gas target (SGT) is stable against all small perturbations and against certain types of large perturbations. The closely-related transonic gas target (TGT) appears to be unstable to all perturbations. Comparison of hypersonic, transonic, and subsonic gas targets shows that the SGT is the most advantageous type and operates at a lower mass flow and at less severe stagnation tank conditions than the TGT or HGT. The problem of a deuterium spill into the tritium port of a straight hypersoni target was also investigated.

59030 **Flute stabilization by a cold line-tied blanket.** Segal, D.; Wickham, M.; Rynn, N. (Department of Physics, University of California, Irvine, California 92717). *Physics of Fluids;* **25**: No. 9, 1485-1487(Sep 1982).

The curvature-driven flute instability in an axisymmetric mirror was stabilized by an annular line-tied plasma blanket. A significant temperature difference was maintained between core and blanket. Theoretical calculations support the experimental observations.

59031 **Steady-state planar ablative flow.** Manheimer, W.M.; Colombant, D.G.; Gardner, J.H. (Plasma Theory Branch, Plasma Physics Division, Naval Research Laboratory, Washington, D.C. 20735). *Physics of Fluids;* **25**: No. 9, 1644-1652(Sep 1982).

Steady-state planar ablative flow in a laser produced plasma is studied. The calculations relate all steady-state fluid quantities to only three parameters, the material, absorbed irradiance, and laser wavelength. The fluid is divided into three regions; the subcritical expanding plasma, the steady-state ablation front, and the accelerated slab. Boundary conditions at the interfaces of these regions are given. If the absorbed irradiance is nonuniform, the nonuniformity in ablation pressure is calculated. Results are compared with experiment and fluid simulation for both uniform and nonuniform illumination.

59032 **Flow enhancement in magnetically insulated ion injectors.** Poukey, J.W.; Humphries, S. Jr.; Lockner, T.R. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Physics of Fluids;* **25**: No. 8, 1471-1479(Aug 1982). Contract AC04-76DP00789.

Magnetically insulated gaps have proved useful for the production of high current density ion beams. Although ion flow well beyond conventional space charge limits has been observed, previous theoretical treatments have not predicted such flow enhancement at the magnetic fields typically used. One-dimensional numerical simulations are presented which demonstrate that trapped electron distributions are accessible that cancel much of the effect of ion space charge. This allows ion flow more than an order of magnitude higher than the Child limit. Two processes that result in modified electron distributions have been investigated; the use of a distributed initial electron source and electron diffusion across insulating field lines (specific instabilities were not studied). In both cases, high flow enhancement can be obtained with relatively small electron loss current.

59033 **APACHE: A low-background hard x-ray spectrometer for 10.6-μm laser fusion experiments.** Priedhorsky, W.; Lier, D. (Los Alamos National Laboratory, P.O. Box 1663 MS-410, Los Alamos, New Mexico 87545). *Review of Scientific Instruments;* **53**: No. 8, 1189-1197(Aug 1982). Contract W-7405-ENG-36.

We describe a ten-channel hard x-ray spectrometer, named APACHE, which is used to diagnose target x-ray spectra at the HELIOS 10.6-μm laser fusion facility. Each channel consists of a filter, scintillator, and photodiode detector. Spectral bands are defined by filtration, and the choice of scintillator type and thickness. This scheme of channel definition gives broad spectral response channels, but it also yields large signals at the detector. This allows the use of insensitive photodiodes as detectors, reducing the effect of penetrating background. The two scintillators used, cesium fluoride and a lead-loaded plastic scintillator (NE142), have time responses of a few nanoseconds. The system is thus unable to resolve the 1-ns laser pulse, but is useful in isolating the target signal from laser electron beam, and possible target neutron, backgrounds. Cesium fluoride has a low scintillation response for $h\nu <$ or $=100$ keV, and is used for higher-energy channels; NE142, which is self-absorbing in thick sections, is used for low-energy channels. Both scintillators have been shown to be stable over a time scale of months. Because of the broad spectral response functions, the channel signals are fit to an exponential spectrum. Very good fits are obtained by this method. The APACHE results are corroborated by an independent thermoluminescent dosimeter system. A fast detector is used to provide $\sim$400 ps time resolution in a separated broad high-energy channel (named CYCLOPS). The agreement of the fast signal with that predicted from the APACHE spectrum demonstrates that APACHE measures the prompt hard x-ray signal. A linear relation is found between fastest ion velocity and APACHE kT/sub H/, providing an additional check of APACHE results. The APACHE system has proved convenient to field and free of background, and is a standard diagnostic at the HELIOS facility. We routinely measure hard x-ray yields of tens of joules from laser shots on high-Z targets.

59034 **Soft x-ray measurements from the PDX tokamak.** Silver, E.H.; Bitter, M.; Brau, K.; Eames, D.; Greenberger, A.; Hill, K.W.; Meade, D.M.; Roney, W.; Sauthoff, N.R.; Von Goeler, S. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **53**: No. 8, 1198-1213(Aug 1982). Contract AC02-76CH03073.

Temporally and spatially resolved profiles of the PDX soft x-ray spectra have been measured during single tokamak pulses of circular divertor plasmas with a recently developed pulse-height analyzer. This detection system incorporates an array of five vertically displaced sets of lithium-drifted silicon detectors, each consisting of three independent channels optimized for rapid data collection in adjacent energy regions. Simultaneous measurements of x-ray emission integrated along five chords of the plasma cross section can, thereby, be achieved. Abel inversion of these data yields temporally resolved radial profiles of the local electron temperature from the slope of the continuum, concentrations of high-Z impurities from the characteristic line intensities, and a measure of Z/sub eff/ from the continuum intensity. The techniques of x-ray pulse-height analysis, with illustrations featuring the results from the initial PDX circular plasma experiments, are discussed in detail. In addition, comparisons between circular and divertor plasmas on PDX, derived from the x-ray measurements, are also presented.

59035 **Sensitivity of capacitance diaphragm manometers to static magnetic fields.** Dylla, H.F.; Provost, T.J. (Princeton University, Plasma Physics Laboratory, Princeton, New Jersey 08544). *Journal of Vacuum Science and Technology;* **21**: No. 2, 707-708(Jul 1982). Contract AC02-76CH03073.

The sensors of the two capacitance diaphragm manometers investigated in this study appear to have no significant dependence upon exposure to static magnetic fields. Subsequent use of the sensors in the near-field environment of the PDX tokamak showed the sensors could perform unshielded in a magnetic environment, however, it was found necessary to magnetically shield the associated signal-conditioning electronics.

59036 **Magnetic-field—induced surface transport on laser-irradiated foils.** Forslund, D.W.; Brackbill, J.U. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review Letters;* **48**: No. 23, 1614-1617(7 Jun 1982).

Electrons heated by absorption of laser energy are shown to generate intense magnetic fields which rapidly spread from the edge of the laser spot along the target surface. The fields convectively transport hot electrons and confine a major fraction of the deposited laser energy in the corona. Eventually, this energy is lost to fast-ion blowoff or deposited at large distances from the spot. This model qualitatively explains many experimental observations of thermal-transport inhibition and fast-ion loss.

59037 **Evaporation of pellets injected into tokamak plasmas and the classical flux-limit parameter.** Mayer, F.J. (KMS Fusion Inc., Ann Arbor, Michigan 48106). *Physical Review Letters;* **48**: No. 20, 1400-1403(17 May 1982). Contract AC08-78DP40030.

The steady-state saturated-evaporation theory of a cold cloud in a hot tenuous atmosphere developed by Cowie and McKee is applied to the evaporation of pellets injected into tokamak plasmas. The agreement with limited experimental results is found to be quite good, and extrapolation of the theory to a reactor-size tokamak indicates a required pellet injection velocity of 5 x 10^6 cm/sec. Finally, the experimental evaporation times can be viewed as a measurement of the "classical" flux-limit parameter, which is found to be $f = 0.6$.

59038 **Applications of rep-ratable mass accelerators (such as MAID).** Tidman, D.A.; Goldstein, S.A. (JAYCOR, Alexandria, VA). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics;* **MAG-18**: No. 1, 115-120(Jan 1982). (CONF-801138—).

From Electromagnetic guns and launchers conference; San Diego, CA, USA (4 Nov 1980).

Several applications of mass-accelerators are discussed with emphasis on impact fusion as one of the most ambitious goals for such devices. Many applications require that the accelerator be capable of being repetitively fired. 20 refs.

59039 **Concepts and limitations of macroparticle accelerators using travelling magnetic waves.** Wipfs, S.L. (Los Alamos Natl Lab, NM). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics;* **MAG-18**: No. 1, 121-126(Jan 1982). (CONF-801138—).

From Electromagnetic guns and launchers conference; San Diego, CA, USA (4 Nov 1980).

The concept of an accelerator using a travelling magnetic wave that acts on magnetized projectiles is discussed. Although superconductors potentially may be good projectile material, their low critical temperature makes them unsuitable. Among ferromagnetic materials, dysprosium seems superior. For stable suspension and guidance, a high conductivity (preferrably superconducting) guide sheet is necessary. Magnetic field gradients of 10/sup 9/ amp/m/sup 2/ travelling at 10/sup 6/ m/s should be achievable using present state-of-the-art components; resulting accelerations are /APP GRTH/500 km/s/sup 2/. A linear accelerator for final speeds of 50 km/s needs a length of 2.5 km. Guidance forces sufficient to produce acceleration of 2*10/sup 6/ m/s/sup 2/ allow circular accelerators of reasonable size to achieve hypervelocities for small (50-100 mg) projectiles. An accelerator of 170-m diam would surpass the best results from light gas guns. Travelling waves suitable for accelerations of 10/sup 4/-m/s/sup 2/ can be produced without switching by means of flux displacing rotors and may be adapted to circular accelerators. 10 refs.

59040 **Review of melting and evaporation of fusion reactor first walls.** Fillo, J.A.; Makowitz, H. (Brookhaven Natl Lab, Upton, NY). *American Society of Mechanical Engineers, [Paper];* No. 81-WA/HT-33, vp(Nov 1981).

The most severe thermal loading on the first wall will occur when the plasma becomes unstable resulting in a hard plasma disruption or at the end of a discharge when the plasma is dumped on the wall in a very short period of time. Hard plasma disruptions are of particular concern in future fusion reactors where the thermal energy of the plasma may reach values on the order of 300 MJ. 16 refs.

59041 **Particle accelerator conference, accelerator engineering and technology, 1981.** Placious, R.C. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 3, 1961-3616(Jun 1981). (CONF-810314—).

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

The proceedings contain 506 papers, of which 281 are separately indexed. The topics covered include: high-energy particle accelerators; low and intermediate energy circular accelerators; accelerator technology; beam dynamics; particle sources, electrostatic accelerators; applications of accelerators; new accelerator techniques, intense beams; and linear accelerators.

59056 Fueling moving ring field-reversed mirror reactor plasmas. Felber, F.S. (Gen At Co, San Diego, CA). *Nuclear Technology;* **50**: No. 2, 119-123(Sep 1980).

The concept of small fusion reactors is being studied jointly by Lawrence Livermore Laboratory General Atomic Company, and Pacific Gas and Electric Company. The objective is to investigate alternatives and then to develop a conceptual design for a small reactor that could produce useful, though not necessarily economical, energy by the late 1980s. Three methods of fueling a small moving ring field-reversed mirror are considered: injection of fuel pellets accelerated by laser ablation, injection of fuel pellets accelerated by deflagration-gun ablation, and direct injection of plasma by a deflagration gun. 13 refs.

59057 Comparative study of tritium breeding performance of lithium, Li_2O, and Li_7Pb_2 blankets in a tokamak power reactor. Jung, J. (Argonne Natl Lab, IL). *Nuclear Technology;* **50**: No. 1, 60-82(Aug 1980).

A nuclear analysis of tritium breeding performance has been carried out for three candidate breeding materials of liquid lithium, solid Li/sub 2/O, and solid Li/sub 7/Pb/sub 2/. The tritium breeding characteristic in each breeder material and the effects of graphite reflector and beryllium neutron multiplier are studied. The impact of the tritium breeding on the minimum blanket/shield thickness requirement for the TF-magnet protection is analyzed in detail. Discussions are made on space allowances for the nonbreeding inner blanket concept and major penetrations. The analysis of the characteristic neutron spectra in the three breeder materials, and the analysis of the effect of helium-coolant volumes in the solid Li/sub 2/O and Li/sub 7/Pb/sub 2/ compounds are presented. 23 refs.

59058 Use of yttrium for the recovery of tritium from lithium at low concentrations. Buxbaum, R.E.; Johnson, E.F. (Princeton Univ, NJ). *Nuclear Technology;* **49**: No. 2, 307-314(Jul 1980).

A particularly difficult problem for first-generation fusion power reactor systems is the recovery of tritium at very low concentration levels from the reactor blanket when lithium metal is the principal tritium breeding medium. On the basis of recent data and reasonable extrapolations, the authors show that it is likely that yttrium metal can be used to extract tritium from lithium at concentrations as low as 10/sup -6/ atom fraction tritium in lithium under conditions that are practicable for commercial power machines. 26 refs.

59059 **Investigation of nonmetallic element interactions in vanadium-alloy/lithium systems.** Smith, D.L.; Lee, R.H.; Yonco, R.M. (Argonne Natl Lab, IL). pp 2.72-2.80 of International conference on liquid metal technology in energy production proceedings, 2nd, 1980. Dahlke, J.M. (ed.). Washington, DC; American Nuclear Society (1980).

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

The compatibility of vanadium and vanadium-base alloys with liquid lithium is being evaluated in a loop constructed of a stainless steel-clad vanadium-15 wt % chromium alloy. Information on the distribution of hydrogen and nitrogen between lithium and the vanadium-base alloys is reported. Interactions of nonmetallic elements in lithium with titanium, zirconium, and yttrium were also investigated to determine the effectiveness of these metals for controlling the concentrations of hydrogen, nitrogen, carbon, and oxygen in lithium. 12 refs.

59060 **Liquid metals in tokamak reactor blankets.** Smith, D.L.; Gold, R.E. (Argonne Natl Lab, Ill). pp 10.21-10.32 of International conference on liquid metal technology in energy production proceedings, 2nd, 1980. Dahlke, J.M. (ed.). Washington, DC; American Nuclear Society (1980).

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

Tokamak blanket applications for which liquid metals or alloys are potential candidates include: breeding tritium, the coolant, and neutron multiplication. Of various liquid metals considered, liquid lithium as the breeder/coolant offers the most advantages. The Li-Pb-Bi system appears to be the best alternate. Pb-Bi has attractive properties for the neutron multiplier. 18 refs.

59061 **Impurity meters for liquid lithium systems.** Down, M.G. (Westinghouse Electr Corp, Pittsburgh, Pa). pp 14.16-14.22 of International conference on liquid metal technology in energy production proceedings, 2nd, 1980. Dahlke, J.M. (ed.). Washington, DC; American Nuclear Society (1980).

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

Results of feasibility testing of permeation-type hydrogen meters and galvanic cell oxygen meters are reported. 34 refs.

59062 **Argonne National Laboratory superconducting pulsed coil program.** Wang, S.T.; Kim, S.H. (Argonne National Lab., IL (USA)). pp 90-109 of Superconductive energy storage. Nishimura, M. (ed.). Osaka, Japan; Kuroki Publishing Company (1980).

From International symposium on superconductive energy storage; Osaka, Japan (8 Oct 1979).

Argonne National Laboratory (ANL) has recognized the clear advantage of a superconducting ohmic heating coil and started an aggressive development program in FY 1977. The main objectives are to develop high current (-- 100 kA) cryostable cable configurations with reasonably low ac losses, to build a demonstration pulsed coil, and to develop a rather inexpensive large fiberglass reinforced helium cryostat. A 1.5-MJ cryostable pulsed superconducting coil has been developed and constructed at ANL. The coil has a peak field of 4.5 T at an operating current of 11.0 kA. A large inexpensive plastic cryostat has been developed for testing the pulsed coil. The coil has been pulsed with a maximum dB/dt of 11 T/s. The coil was pulsed more than 4000 cycles. Detailed results of the ac loss measurements and the current sharing of the cryostability will be described. Other objectives of the on-going pulsed coil program is to study the parallel operation of pulsed coils, to develop and evaluate a 50-kA and 100-kA cryostable cable and to perform a preliminary engineering design of a 100-MJ engineering demonstration coil.

59063 **Conceptual design of a superconductive energy and transfer system for a commercial tokamak EF coil.** Fuja, R.E. (Argonne National Lab., IL (USA)). pp 122-126 of Superconductive energy storage. Nishimura, M. (ed.). Osaka, Japan; Kuroki Publishing Company (1980).

From International symposium on superconductive energy storage; Osaka, Japan (8 Oct 1979).

A conceptual design has been developed for a superconducting energy storage coil and a dc-ac-dc three phase converter which match the voltage and current requirements of the equilibrium field (EF) coil in a commercial tokamak reactor. The system can generate 13 kV, 26 kA peak, 15 kA rms for 15 sec to charge or discharge the EF coil. A hypothetical example utilizing this design and component cost analysis are given. The current and voltage profiles for the EF coil presented here were obtained from a February 1979 Argonne National Laboratory technical memorandum[1] on power supply requirements for a tokamak.

59064 **Cryostable superconductors in energy storage systems.** Furuto, Y.; Meguro, S. (Furukawa Electric Co. Ltd., Tokyo (Japan). Central Research Lab.). pp 205-209 of Superconductive energy storage. Nishimura, M. (ed.). Osaka, Japan; Kuroki Publishing Company (1980).

From International symposium on superconductive energy storage; Osaka, Japan (8 Oct 1979).

A brief review is made of the superconductors used for energy storage magnets and cryostable superconductors manufactured in Japan, 200 meters of the large-current conductor with the cross section of 27 mm x 12.8 mm and with the critical current of about 20 KA at 8T have been recently manufactured. The designs and test results of the conductor are described. Finally, a conceptual design of 50 KA conductors for the energy storage coil rated 100 - 1,000 MWH is presented.

59065 **Aspects of superconductive energy storage systems for supply of fusion magnets.** Komarek, P.; Ulbricht, A. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Technische Physik). pp 32-38 of Superconductive energy storage. Nishimura, M. (ed.). Osaka, Japan; Kuroki Publishing Company (1980).

From International symposium on superconductive energy storage; Osaka, Japan (8 Oct 1979).

The demand of pulsed power for fusion reactors and the method of supplying the pulsed power are discussed. The requirements for energy and power are as follows. The energy requirement is 5 x 10^9 Ws, the time step is several seconds, and the apparent power is 10^9 VA. An established technique to supply the pulsed power demand of fusion magnets is the use of flywheel motor-generator sets supported by the grid. There exist different indications that superconducting energy storage units with capacitive acting machines or converter can become a more attractive alternative. One constraint is the high voltage technology to be applied for such storage coils, especially its influence on costs and reliability. The main fields of problems which had to be solved and handled were material properties at high voltage, component design at high voltage, testing methods, the quench protection of coils at high voltage and transient behavior in components. Discussions about these problems are presented in this paper.

59066 **Buckling of a superconducting ring in a toroidal magnetic field.** Moon, F.C. (Cornell University, Ithaca, NY). *Journal of Applied Mechanics;* **46**: 151-155(Mar 1979).

Experimental evidence and a theoretical model are presented for the magnetoelastic buckling of a rigid superconducting ring in a steady circumferential (toroidal) magnetic field. The theoretical model predicts a coupled translation and pitch displacement of the coil in the buckled mode. A discussion is given of both the linear and nonlinear magnetic perturbation forces. The experiments were conducted in liquid helium (4.2 K). The lowest natural frequency of the rigid coil on elastic springs was observed to decrease near the buckling current. Agreement between theory and experiment is fair. These results may have design implications for poloidal field coils in magnetic fusion Tokamak reactors.

59067 **Tritium System Test Assembly control-system cost estimate.** Stutz, R.A. (Los Alamos Scientific Lab., NM). *Transactions of the American Association of Cost Engineers;* B.7.1-B.7.7(1979). (CONF-790715—).

From 23. annual meeting of the American Association of Cost Engineers; Cincinnati, OH, USA (15 Jul 1979).

The Tritium Systems Test Assembly (TSTA), is dedicated to the development, demonstration and interfacing of technologies related to the deuterium-tritium fuel cycle for the fusion reactor systems. Tritium, an isotope of hydrogen, will be a major fuel for fusion reactor systems. The principal objectives for TSTA can be concisely stated: demonstrate the fuel cycle for fusion power reactors; develop, test and qualify equipments for tritium service in the fusion program; develop and test environmental and personnel protective systems; provide a final facility that can be used for demonstration and as an example that could be directly copied by industry; demonstrate long-term reliability of components; demonstrate long-term safe handling of tritium with no major releases or incidents; and investigate and evaluate a response of the fuel cycle and environmental packages to normal, off-normal and emergency situations.

59068 **Survey of mirror machine reactors.** Condit, W.C. (California University, Livermore, CA). pp 651-680 of Diagnostics for fusion experiments. Proceedings of the course, Varenna, Italy, September 4-16, 1978. Sindoni, E.; Wharton, C. Oxford, England; Pergamon Press (1979). Contract W-7405-ENG-48.

From International school of plasma physics; Varenna, Italy (Sep 1978).

The paper examines the Magnetic Mirror Fusion Program. Starting from the simple axisymmetric mirror concept the program overcame gross flute-type instabilities and the most serious microinstabilities. Dense plasmas approaching the temperature range for fusion were produced, and extensive design studies of mirror configurations led to three designs: the standard mirror fission-fusion hybrid, tandem mirror, and the field-reversed mirror. Typical plasma parameters are given for each type of machine, concluding that in a working fusion reactor, diagnostics will be required for operational control.

59069 **Mirror position display equipment for the target chamber mirror mounts of the LASL HELIOS laser fusion facility.** Wells, F.D.; Remington, D.A. (California University, Los Alamos, NM). pp 4.8-4.12 of Engineering - key to the future. Region VI conference, Sacramento, California, April 25-27, 1979, conference record. New York, NY; IEEE (1979).

From IEEE region six conference; Sacramento, CA, USA (25 Apr 1979).

Equipment has been fabricated which records the absolute positions of sixteen mirror mounts used to direct and focus eight high-energy laser beams for research in laser induced fusion. Each mirror mount is driven by three stepping motors, controlled to produce the motions of Focus, Tilt, and Rotate relative to the target. Stepping of the motors is sensed by incremental optical encoders coupled to the motor drive shafts. Outputs from the encoder tracks are multiplexed to a microprocessor which transmits motor step information via a fiber optical data link to a Mirror Position Display chassis. This unit accumulates the steps, stores the motor positions, displays mirror position data to the operator, and provides the equipment control functions. Standby battery power is included to retain the motor step data in the event of power failure.

59070 **Non-electric fusion energy applications.** Bogart, S.L. (U.S. Department of Energy, Div. of Magnetic Fusion Energy, Washington, D.C.). pp 371-402 of Driven magnetic fusion reactors. Proceedings of the course, Erice, Italy, September 18-26, 1978. Oxford, England; Pergamon Press (1979).

From Driven magnetic fusion reactors; Erice, Italy (18 Sep 1978).

Studies aimed at assessing the feasibility of nonelectric fusion energy applications are reviewed, with particular reference to the Inexhaustible Energy Resources Planning Study. Particular attention is given to fusion-fission energy systems and synthetic chemical fuel production by fusion reactors.

59071 **Polytran NaCl windows for LASL Antares CO_2 Laser System.** Straughan, V.E. (Harshaw Chemical Co., Crystal and Electronic Products Dept., Solon, OH). pp 106-111 of Los Alamos Conference on Optics. Liebenberg, D.H. Palos Verdes Estates, CA; Society of Photo-Optical Instrumentation Engineers (1979).

From Conference on Optics; Los Alamos, NM, USA (23 May 1979).

A review is given of the technology and special facilities applied in the production of 18-inch diameter Polytran NaCl windows. These optical elements are to be employed in the LASL Antares CO_2 Laser System. Procedures in achieving window specifications are discussed.

59072 **LOTS analysis of optical diffraction in Antares.** Wolfe, P.N. (California, University, Los Alamos, N. Mex.); Saxman, A.C. (California, University, Los Alamos, N. Mex.; Arizona, University, Tucson, Ariz.). pp 232-237 of Los Alamos Conference on Optics. Liebenberg, D.H. Palos Verdes Estates, CA; Society of Photo-Optical Instrumentation Engineers (1979).

From Conference on Optics; Los Alamos, NM, USA (23 May 1979).

Diffraction and aberration effects are calculated for the power-amplifier and target-system portions of the 100-kJ Antares laser fusion facility, using LOTS, a fast-Fourier-transform propagation code incorporating a model for saturating gain in CO_2. Energy losses due to diffraction are found to be small compared to other losses. Diffraction 'hot spots' usually typical of propagation at low Fresnel numbers are effectively suppressed in the Antares power amplifier by gain saturation. Taking account of diffraction and aberrations over the whole optical train, the code predicts a target focal spot that has 82% of its energy in a 150-micron-diameter circle, a result essentially identical to what would be expected of the final focus mirror alone.

99 GENERAL AND MISCELLANEOUS

59073 **(NP—2903467) Scientific activities 1979: nuclear Research Centre Demokritos.** (Atomic Energy Commission, Athens (Greece)). 1981. 134p. Dep. NTIS (US Sales Only), MF A01. Order Number DE82903467.

Portions of document are illegible.

This edition covers the scientific activities of the Nuclear Research Center Demokritos for the year 1979. Each division has a number of projects which are listed individually. The title of the project, the objectives, the year of commencement of the program, the name of the head of the project, developed activities, publications, report etc., are listed for each project.

59074 **(LBL—13613) 50th Anniversary, 1931-1981: symposium and banquet speeches.** (Lawrence Berkeley Lab., CA (USA)). 3 Oct 1981. Contract W-7405-ENG-48. 164p. (CONF-8110222—). NTIS, PC A08/MF A01. Order Number DE82013635.

From Symposium and banquet speeches of the celebration of the 50th anniversary of Lawrence Berkeley Laboratory; Berkeley, CA, USA (3 Oct 1981).

The proceedings includes talks given at the symposium and the banquet. They include examples of technology at the laboratory and speculation on the future at the laboratory. (GHT)

9902 Mathematics And Computers

REFER ALSO TO CITATION(S) 56266, 56791, 58006, 58415, 58801

59075 (BNL—30609) Traditional computing center as a modern network node. Heller, S.; Peskin, A.M. (Brookhaven National Lab., Upton, NY (USA)). Nov 1981. Contract AC02-76CH00016. 17p. NTIS, PC A02/MF A01. Order Number DE82006935.

There is an obvious trend toward decentralization of computing power from the traditional, large computing center. Even so there remains a generous, but changing role for such centers to play. Their capabilities would then be complimentary to smaller, individualized facilities, so the user would benefit greatly from a general purpose, local network on which the large center represented a node. There is no network currently available that exhibits all the attributes of the ideal local for this environment. It can be approached, however, by combining several diverse products as network segments, which are interconnected via processor gateways. This is in fact the strategy being followed at Brookhaven National Laboratory, which has a computing environment typical of a large class of institutions. The attributes of the ideal network are presented. A brief discussion of the current state-of-the-art in networking is then given. Finally, the particulars of the Brookhaven implementation are offered as a case history.

59076 (CERN—81-12) CERNET: a high-speed packet-switching network. Gerard, J.M. (ed.). (European Organization for Nuclear Research, Geneva (Switzerland)). 22 Dec 1981. 92p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE82702210.

A general mesh-structured high-speed computer network has been designed and built. This network provides communication between any pair of connected user computers over distances of upto 6 km and at line speeds of 1 to 5 Mbit/second. The network is composed of a communication subnet providing a datagram service, complemented by tasks in the connected machines to implement an end-to-end logical link protocol. Details are given of the overall structure as well as the specific modules of which the system is composed.

59077 (CERN—81-16) Least squares methods in physics and engineering. Bjoerck, A. (European Organization for Nuclear Research, Geneva (Switzerland)). 19 Nov 1981. 66p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE82702211.

These lectures deal with numerical methods representing the state of the art, including the available computer software. First a brief background of basic matrix factorizations is given. Dense linear problems are then treated, including methods for updating the solution when rows and variables are added or deleted. Special consideration is given to weighted least squares problems and constrained problems. Regularization of ill-posed problems are briefly surveyed. Sparse linear least squares problems are treated in some detail. Different ordering schemes, including ordering to block-angular form and nested dissection, and iterative methods are discussed. Finally a survey of methods for nonlinear least squares problems is given. The Gauss-Newton method is analyzed and its local convergence derived. Levenberg-Marquardt methods are discussed and different methods using second derivative information surveyed. Special methods are given for separable linear-nonlinear problems.

59078 (CNEN-RT/EDP—(80)6) BC graphics system - user's guide. Panini, G.C. (Comitato Nazionale per l'Energia Nucleare, Bologna (Italy). Dipartimento Ricerca Tecnologica di Base ed Avanzata). Nov 1980. 51p. (In Italian). Dep. NTIS (US Sales Only), MF A01. Order Number DE82903021.

Portions of document are illegible.

The BC System is a package of inter-related subroutines entirely written in FORTRAN IV to graphically display computer data. In order to produce graphics output a FORTRAN programme is written to perform whatever computations and/or graphics manipulations are needed to produce the desired image. Its features include portability, device independent, modularity and easy to use. The main entry points of the System are here described.

59079 (CONF-820740—1) Portable software package for nonlinear partial differential equations. Neuberger, J.W.; Renka, R.J. (Oak Ridge National Lab., TN (USA)). 1982. Contract W-7405-ENG-26. 31p. NTIS, PC A03/MF A01. Order Number DE82018261.

From SIAM 30th annuversary meeting; Stanford, CA, USA (19 Jul 1982).

This paper describes a storage-efficient method and associated software package for the solution of a general class of second-order nonlinear partial differential equations. The method is essentially an iterative scheme for the least squares minimization of a finite difference discretization of the residual. The advnatages of this approach are its ability to treat a wide range of problems (it is type-independent) and its low storage requirements - O(N) for N grid points. The effectiveness of the method is based on a gradient-smoothing technique which increases the rate of convergence of the iterative procedure.

59080 (DEMO—80/7) M-8000: an assembly language for the INTEL-8080 microcomputer. Skordalakis, E. (Atomic Energy Commission, Athens (Greece)). Nov 1980. 49p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82902784.

Portions of document are illegible.

An assembly language for the INTEL-8080 microcomputer, namely the M-8080, is described in this report. M-8080 belongs to the DGCAS family of similar assembly languages and as such it can be translated by DGCAS which is a homemade Meta-Assembly System *(a meta-assembler + a meta-linking loader). M-8080 is a powerful assembly language but it is incompatible with the INTEL-8080 assembly languages offered by INTEL corporation. This report is both a reference manual for the M-8080 assembly language and an implementation manual for the cross tools which translate M-8080.

59081 (EDF-R—81H331065) Computed estimation of density. Pantin, A.L.; Molliere, J.L. (Electricite de France, 92 - Clamart. Service Informatique et Mathematiques Appliquees). Mar 1981. 30p. (In French). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82702344.

This note presents a programme of assessment of the density f(x) of a law as from an x_1, x_2, ...,xsub(n) sample of n size which enables the fsub(n)(x) assessment to be calculated automatically, and provides the possibility of furnishing an automatic plot of the density curve on a Benson plotting table.

59082 (EGG-FE—5842) Identification of multivariate linear systems. Griffith, J.M. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1982. Contract AC07-76ID01570. 63p. NTIS, PC A04/MF A01. Order Number DE82015201.

Portions of document are illegible.

Multivariate identification problems are treated with a least-squares approach. A chapter on scalar problems focuses attention on the classical parameter-estimate bias problem caused by measurement noise and develops a straightforward and effective way to remove the bias. A chapter on multivariate problems generalizes the bias removal method and develops a form selection procedure. The form selection procedure generally ensures more accurate identification than is possible with identification methods which rely on a fixed form. The concept of a form selection procedure is new to this work. A results chapter presents four example problems. Each example illustrates specific features of the identification technique. As a collection the examples emphasize the complexity of system identification and demonstrate that identification techniques will perform well when carefully applied.

59083 (JAERI-M—9592) Manual on unit conversion program library UCL2. Abe, Kiyoharu. (Japan Atomic Energy Research Inst., Tokyo). Jul 1981. 96p. (In Japanese). NTIS (US Sales Only), PC A05/MF A01. Order Number DE82702213.

The unit conversion program library UCL2 has been developed. This library is the expanded and modefied version of UCL1, which was developed for the unit conversion for dynamics and thermodynamics. Using this library, the user can obtain the accurate unit conversion factors between arbitrary units in consistent way. UCL2 has two major functions. The first one is to register the information of dimensions, units and unit systems. This work can be done automatically by the program and/or individually according to the user's selection. The second one is to obtain the unit conversion factor from a certain unit to the unit with same dimension in a certain unit system. Besides, UCL2 has many utility subprograms including character handling programs and unit conversion factor printing-out programs. The application of UCL2 to computer codes will not only improve the accuracy of the codes but prevent careless mistakes in programming about unit conversion. Especially, various correlation programs, the development of which takes a large part of programming work for a large scale computer code, can be developed so that they may be used for any unit system, which will result in the decrease of programming work significantly. Unit conversion factor tables for various physical quantities in dynamics and thermodynamics field were produced from a sample run and are listed in the appendix.

59084 **(KFK—3156) Software monitor in a central computer supervising several microcomputers.** Heep, W.; Rietzschel, K.; Rusch, K.D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Datenverarbeitung und Instrumentierung). Mar 1981. 42p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE82902716.

Several autonomous microcomputers are coupled by a serial interface to a central computer. A basic instruction set allows exchange of data and control information. The process is synchronized and controlled by event flags. Terminal orientated commands allow the user to supervise and modify the process activities.

59085 **(LA—9244-MS) Casual User Project: problems, proposed solutions, and implementation.** Prommel, J. (Los Alamos National Lab., NM (USA)). May 1982. Contract W-7405-ENG-36. 60p. NTIS, PC A04/MF A01. Order Number DE82016407.

This report responds to requests from the Computer User's Priorities Task Force 2 to address the needs of casual users of the Los Alamos Computing Network. Problems, proposed solutions, and the status of implementation of those proposed solutions are discussed for seven major categories. These categories are orientation, education, physical reorganization, user input, documentation, consulting services, and user/network interface.

59086 **(LBL—13287) Adaptive finite-difference method for hyperbolic systems in one space dimension.** Bolstad, J.H. (Lawrence Berkeley Lab., CA (USA)). Jun 1982. Contract AC03-76SF00098. 217p. NTIS, PC A10/MF A01.

Thesis. Submitted to Stanford Univ., CA.

Many problems of physical interest have solutions which are generally quite smooth in a large portion of the region of interest, but have local phenomena such as shocks, discontinuities or large gradients which require much more accurate approximations or finer grids for reasonable accuracy. Examples are atmospheric fronts, ocean currents, and geological discontinuities. This thesis develops and partially analyzes an adaptive finite difference mesh refinement algorithm for the initial boundary value problem for hyperbolic systems in one space dimension. The method uses clusters of uniform grids which can move along with pulses or steep gradients appearing in the calculation, and which are superimposed over a uniform coarse grid. Such refinements are created, destroyed, merged, separated, recursively nested or moved based on estimates of the local truncation error. A four-way linked tree and sequentially allocated deques (double-ended queues) are used to perform these operations efficiently. The local truncation error in the interior of the region is estimated using a three-step Richardson extrapolation procedure, which can also be considered a deferred correction method. At the boundaries we employ differences to estimate the error. Our algorithm was implemented using a portable, extensible Fortran preprocessor, to which we added records and pointers.

59087 **(NUREG—0917) Nuclear Regulatory Commission staff computer programs for use with meteorological data.** Snell, W. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). Jul 1982. 141p. GPO $6.00.

The Nuclear Regulatory Commission (NRC) receives hour-by-hour meteorological data on magnetic tape in a format specified in Regulatory Guide 1.70, Revision 2, Standard Format and Content of Safety Analysis Reports for Nuclear Power Plants (September 1975). The purpose of this report was to document the computer programs that are used by the NRC meteorology staff to examine, assess and utilize these hourly values of meteorological data. A description of each of the programs is given along with the input requirements, discussion of output, subroutine flow chart, a description of each subroutine, sample output and a program listing.

59088 **(ORNL/CSD/TM—159) Screening designs for response surface experiments.** Morris, M.D. (Oak Ridge National Lab., TN (USA)). Aug 1982. Contract W-7405-ENG-26. 17p. NTIS, PC A02/MF A01. Order Number DE82020486.

Screening experiments are discussed for the case in which the underlying model is a response surface polynomial of unknown degree. Systematic fractional replicate designs (Cotter, 1979) are discussed and extended for use in the response surface setting. A model selection strategy is outlined based on analysis of the designed experiment.

59089 **(ORNL/TM—7941) Resource data inventory for the Oak Ridge area.** Mann, L.K.; Kitchings, J.T. (Oak Ridge National Lab., TN (USA)). Aug 1982. Contract W-7405-ENG-26. 56p. NTIS, PC A04/MF A01. Order Number DE82020461.

Portions of document are illegible.

A natural resources data base is described that is useful in natural resource management on the Department of Energy Reservation at Oak Ridge, in research site selection on the National Environmental Research Park (NERP) within the Reservation, in summarizing and analyzing resource data in areas selected for industrial development in and near the Reservation, and in regional analyses both on the Reservation and on adjacent land. Soils, surface geology, slope classes, slope aspect, land use, and roads have been digitized on a 0.5-ha cell size for the Oak Ridge area. Two examples of using the data base with IMGRID, a data storage, retrieval, and modeling system developed by the Tennessee Valley Authority are presented. The first example is a search for barren or glade type soils and the second is a summary of forest productivity classes. Summary information concerning soil series distribution, most common soils, and taxonomy of soils is also included.

59090 **(SAND—80-1734) Starting step size for an ODE solver.** watts, H.A. (Sandia National Labs., Albuquerque, NM (USA)). Jul 1982. Contract AC04-76DP00789. 40p. NTIS, PC A03/MF A01. Order Number DE82020422.

One of the more critical issues in solving ordinary differential equations by a step-by-step process occurs in the starting phase. Somehow the procedure must be supplied with an initial step size that is on scale for the problem at hand. It must be small enough to yield a reliable solution by the process, but not so small as to significantly affect the efficiency of solution. In this paper, we discuss an algorithm for obtaining a good starting step size and present a subroutine which can be readily used in most ODE solvers.

59091 **(UCID—19486) Rescaling of equipotential smoothing.** Winslow, A.M.; Barton, R.T. (Lawrence Livermore National Lab., CA (USA)). 17 Aug 1982. Contract W-7405-ENG-48. 7p. NTIS, PC A02/MF A01. Order Number DE82020425.

A method is described for locally rescaling the curvilinear coordinates used in continuous rezoning of Lagrangian meshes by the equipotential method. In this way the zone aspect ratio may be brought closer to unity.

59092 **(UCID—19489) STR82: combined string and user-interface library for VAX/VMS, RSX-11M, and RT-11.** Garbarini, J.P. Jr. (Lawrence Livermore National Lab., CA (USA)). 10 Aug 1982. Contract W-7405-ENG-48. 66p. NTIS, PC A04/MF A01. Order Number DE82020701.

A combined string and user interface library was written to aid programmers in writing portable code. The library has been implemented under Digital Equipment Corporation (DEC) VAX/VMS, RSX-11M, and RT-11 operations systems for use with FORTRAN programs. This is a reference manual for STR82 which is a library containing string routines and user interface routines. Versions of the library exist for use with VAX-FORTRAN programs running under VAX/VMS and for use with either FORTRAN IV-PLUS or FORTRAN IV programs using PDP-11's running RSX-11M or RT-11. The manual is for programmers using the library on one or more of these systems. Included are the logical functions of the routines and their calling sequences.

59093 (UCID—30191) **MMG: a simple memory manager for FORTLIB.** Dubois, P.F. (Lawrence Livermore National Lab., CA (USA)). 4 Aug 1982. Contract W-7405-ENG-48. 20p. NTIS, PC A02/MF A01. Order Number DE82020424.

Portions of document are illegible.

Memory managers are extremely useful tools. They allow a programmer to write and modify quickly and easily codes involving arrays that have lengths not known at compile time. The popular A-Division memory manager, MMLIB, written by Bob Cooper, is based on BLIB. Cooper's product is sophisticated and has many capabilities. The manager MMG, described here, is simple, but will satisfy most needs and is compatible with FORTLIB. It can manage one to ten different blocks of memory, allocating and releasing arrays within a block at the user's command. One of the blocks can be the space at the end of memory. In this mode, MMG uses the FORTLIB functions MEMORY and LASTMEM, so it correctly deals with FORTLIB I/O buffers. This product was developed as a byproduct of work on a FORTLIB-based weapons code. MMG is available only on the Cray. It works only for codes that do not use the segmented loader, unless the end-of-memory option is not used.

59094 (UCRL—87912) **Analysis of a multigrid method as an iterative technique for solving linear systems.** Greenbaum, A. (Lawrence Livermore National Lab., CA (USA)). 18 Jun 1982. Contract W-7405-ENG-48. 27p. (CONF-8206102—1). NTIS, PC A03/MF A01. Order Number DE82018068.

From DOE NASIG meeting; Los Alamos, NM, USA (23 Jun 1982).

A general class of iterative methods is introduced for solving symmetric, positive definite linear systems. These methods use two different approximations to the inverse of the matrix of the problem, one of which involves the inverse of a smaller matrix. It is shown that the methods of this class reduce the error by a constant factor at each step and that under ideal circumstances that constant is equal to $\kappa'-1/\kappa'+1$, where κ' is the ratio of the largest eigenvalue to the (J+1)/sup st/ eigenvalue of the matrix, J being the dimension of the smaller matrix involved. A multigrid method is presented as an example of a method of this class, and it is shown that while the multigrid method does not quite achieve this optimal rate of convergence, it does reduce the error at each step by a constant factor independent of the mesh spacing h.

59095 (ZfK—433(Vol.2), pp 185-189) **Interactive language for controlling CAMAC and elementary functions using active subroutines.** Lang, I.; Turani, D. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Feb 1981. (In Russian). Dep. NTIS (US Sales Only).

From 10. international symposium nuclear electronics; Dresden, German Democratic Republic (10 Apr 1980).

The interactive language HELP developed in the Central Institute of Physics Research Budapest is a hybrid of the programming languages FOKAL and BASIC. It can be used by all the computers corresponding to the technical standards of the minicomputer type PDP-8. HELP enables controlling and performing of manifold events within the CAMAC systems. The various stages of the programming functions executed according to a strict order of priority are described in detail.

59096 **Easier way to find the sagittal depth: comments.** Brixner, B. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Applied Optics;* **21**: No. 6, 976(15 Mar 1982). Contract W-7405-ENG-36.

An easy formula for calculating both the approximate and (by iteration) the exact sagittal depth of a chord is presented. (AIP)

59097 **Integrating an array processor into a scientific computing system.** Maron, N.; Brengle, T.A. (Lawrence Livermore National Lab., CA). *Computer;* 41-44(Sep 1981). Contract W-7405-ENG-48.

There are many elements to be considered in the integration of an array processor into a scientific computing environment. Our intention here is to clarify these elements and their relationships through detailed discussions of compatibility considerations, host supervisory software operating overhead, and an example system.

59098 **Enumeration of graphical partitions.** Metropolis, N.; Stein, P.R. (Los Alamos Scientific Lab., NM). *European Journal of Combinatorics;* **1**: 139-153(1980).

The present paper greatly extends and elaborates the results of a previous paper by Stein on the enumeration of graphical partitions. The latter are a subset of partitions π 2q with exactly p nonzero parts, with q and p respectively the number of lines and points of a graph without multiple lines, loops or isolated points. The enumeration is effected in terms of an auxiliary set of partitions λ which are in 1-1 correspondence with an appropriate subclass of the partitions π. It is shown, inter alia, how Hakimi's algorithm imposes a definite recursive structure on the set [λ]. It is also shown how to write down in principle explicit enumeration formulae for any r identical with q - p.

9903 Information Handling

REFER ALSO TO CITATION(S) 57059, 58206

59099 (INIS-mf—7042) **Topics in information on nuclear science and technology: conference proceedings.** (Ceskoslovenska Komise pro Atomovou Energii, Prague). 1980. 146p. (In Russian). (CONF-7907118—). NTIS (US Sales Only), PC A07/MF A01. Order Number DE82780682.

59100 (JAERI-M—9860, pp 9-20) **Nuclear energy literature published in Japan.** Narui, S.; Habara, T. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Dec 1981. (In Japanese). NTIS (US Sales Only), PC A04/MF A01.

In Nuclear energy information in Japan. Statistics and analysis.

The supply by Japan to INIS in 1978 were of three thousand four hundred and thirteen items. The nuclear energy literatures published in Japan, 2821 items by excluding patents and laws, consisted of 2,252 journal papers and 505 technical reports. The former were picked up from 333 journals and the latter from 23 report series of 11 organizations. Journal ranking and report contributions are tabled and figures by fields, languages and author's organizations are given in this paper.

59101 (JAERI-M—9860, pp 21-33) **Nuclear energy literature published in foreign countries.** Okumura, K.; Yamamoto, E.; Habu, T. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Dec 1981. (In Japanese). NTIS (US Sales Only), PC A04/MF A01.

In Nuclear energy information in Japan. Statistics and analysis.

In order to analyze nuclear energy literature of Japan published in foreign countries, 842 journal articles and 386 conference articles were extracted from 68,246 items of "INIS Atomindex 1978". The results of the survey were as follows; (1) Majority of articles were concentrated in several ten journals, such as 50% articles in 18 journals and 80% articles in 56 journals. (2) Most of 85 conferences contributed were regular meetings, and many articles were presented in several specific conferences. (3) Portion of technology in the articles were 14% in journals and 35% in proceedings.

59102 (JAERI-M—9860, pp 35-50) **Oral presentations on nuclear energy in Japan.** Habara, T.; Narui, S. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Dec 1981. (In Japanese). NTIS (US Sales Only), PC A04/MF A01.

In Nuclear energy information in Japan. Statistics and analysis.

Oral presentations on nuclear energy in conferences and meetings held in 1978 were surveyed. A total of 144 meetings contained 4,104 presentations on nuclear energy. Physics accounted for 44%, the highest of all presentations, followed by nuclear engineering and chemistry and materials in decreasing order. It is pointed out that, nuclear fusion comprised 21%, higher than nuclear engineering, and became an important portion of Japanese information. A further survey was then made particular with the conferences and meetings of such major societies as the Atomic Energy Society of Japan, the Physical Society of Japan, the Japan Society of Applied Physics, the Chemical Society of Japan and the Japan Health Physics Society. Also it was recognized that the oral presentations are considered as useful data sources for on-going research information.

59103 (JAERI-M—9860) **Nuclear energy information in Japan. Statistics and analysis.** Nakamoto, H. (ed.). (Japan Atomic Energy Research Inst., Tokyo). Dec 1981. 56p. (In Japanese). NTIS (US Sales Only), PC A04/MF A01. Order Number DE82780650.

The papers presented were entered in the data base separately (WHK)

59104 (ORNL/TM—8086) **Distributed resource management: deadlocks.** Hayes, R.W. (Oak Ridge National Lab., TN (USA)). Jun 1982. Contract W-7405-ENG-26. 16p. NTIS, PC A02/MF A01. Order Number DE82016081.

Many applications require data base management without the need for an entire data base management system. Also, most simple locking mechanisms are not adequate for real-time data acquisition and control applications. This report presents a basic resource management mechanism which acts as a traffic cop to control access to shared data bases in a real-time system. This mechanism makes use of a deadlock avoidance algorithm to resolve allocation conflicts. The concept of resource management is developed and the problem of system deadlocking is described. Alternatives to the deadlock problem are presented for real-time systems and a modified deadlock avoidance algorithm is developed to provide efficient resource allocation. This algorithm is implemented on an RSX-11M system and is designed for easy expansion to distributed systems. A basic approach to distributed management is also presented.

CORPORATE AUTHOR INDEX

CORPORATE AUTHOR INDEX

In the Corporate Index, report literature is indexed using the name of the organization or institution responsible for issuing the report. Headings are provided for all report literature and for published literature for which a corporate approach is especially desirable, e.g., symposium and conference proceedings.

Each entry under a corporate heading gives the report title and the volume and abstract numbers. Report numbers, if applicable, are given in parentheses at the end of the entry.

DOE Energy Information Data Base: Corporate Author Entries (DOE/TIC-4585) is used in the standardization of corporate entries. DOE/TIC-4585 is available for purchase from the National Technical Information Service (NTIS), U. S. Department of Commerce, Springfield, Virginia 22161.

Ocean thermal energy conversion (OTEC) cost and performance simulation and analysis. Volume I. Study overview, 7:56578 (ATR—78-7699-01-3-Vol.1)
Ocean thermal energy conversion (OTEC) cost and performance simulation and analysis. Volume II. Engineering manual, 7:56579 (ATR—78-7699-01-3-Vol.2)
Ocean thermal energy conversion (OTEC) cost and performance simulation and analysis. Volume IV. Appendix, 7:56581 (ATR—78-7699-01-3-Vol.4)
Ocean thermal energy conversion (OTEC) cost and performance simulation and analysis. Volume III. User's manual, 7:56580 (ATR—78-7699-01-3-Vol.3)
Third-party financing of central-receiver repowering projects, 7:56474 (ATR—82-7981-02-1)

Aerospace Corp., El Segundo, CA (USA). Space Sciences Lab.
Atmospheric pressure and velocity fluctuations near the auroral electrojet. Technical report, 7:58057 (AD-A—111640/9)
Electron densities in a solar flare derived from x-ray spectra. Technical report, 7:58293 (AD-A—111360/4)

Aerospace Corp., Germantown, MD (USA). Eastern Technical Div.
Military hazardous wastes: an overview and analysis, 7:57074 (ATR—81(8376)-1)

Aerospace Corp., Los Angeles, CA (USA). Space Sciences Lab.
Soft-error susceptibility of a CMOS RAM: dependence upon power-supply voltage, 7:58005 (SAND—81-2140)

Agency for International Development, Washington, DC (USA)
Rural electrification: linkages and justifications. Program evaluation discussion paper No. 3, 7:57127 (PB—82-160151)
Solar energy domestic policy review international panel review of existing federal programs, 7:56481 (PB—82-159930)

Agri-Answer, Inc., Lynn, IN (USA)
Total energy food plant 21 million gallon ethanol facility. Final report, 7:56506 (DOE/RA/50329—1)

Air Force Geophysics Lab., Hanscom AFB, MA (USA)
Role of the big flare syndrome in correlations of solar energetic proton fluxes and associated microwave burst parameters. Environmental research papers, 7:58291 (AD-A—109806/0)

Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA)
Numerical studies of gravitational accretion from x-ray heated stellar winds. Doctoral thesis, 7:58292 (AD-A—110098/1)

Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering
Characterization of an hf-pumped CO_2 laser. Master's thesis, 7:57786 (AD-A—111140/0)
Electric vehicle power controller. Master's thesis, 7:57288 (AD-A—111093/1)
Investigation of laser induced fluorescence for concentration measurements of diatomic sulfur. Master's thesis, 7:57540 (AD-A—111141/8)
Observation and analysis of LiCa and LiMg excimers. Doctoral thesis, 7:57785 (AD-A—111137/6)
Photoluminescence study of ion implantation damage in gallium arsenide. Master's thesis, 7:56485 (AD-A—111135/0)
Spectroscopic analysis of PbO chemiluminescence, 7:57573 (AD-A—111175/6)
Theoretical analysis of an AlGaAs/AlGaAs heteroface back-barrier solar cell. Master's thesis, 7:56486 (AD-A—111174/9)

Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Systems and Logistics
A procedure for determining the resource utilization potential of coal ash. Master's thesis, 7:56031 (AD-A—109877/1)
Development of a multiple linear regression model to forecast facility electrical consumption at an Air Force Base. Master's thesis, 7:57170 (AD-A—109880/5)
Economic analysis of air-conditioning systems with off-peak chilled-water storage. Master's thesis, 7:57169 (AD-A—109876/3)
Economic model of future coal/densified refuse-derived fuel use at Wright-Patterson AFB, Ohio. Master's thesis, 7:56459 (AD-A—111376/0)
Feasibility study on the conversion of Air Force oil-fired heat plants to coal-oil-mixture fired plants. Master's thesis, 7:57836 (AD-A—110215/1)
Generalized procedure for assessing the inclusion/non-inclusion of passive solar techniques in facility design, 7:56583 (AD-A—110976/8)

Air Force Occupational and Environmental Health Lab., Brooks AFB, TX (USA)
Health safe alarm evaluation. Final report, 7:56112 (AD-A—111449/5)

Air Force Wright Aeronautical Labs., Wright-Patterson AFB, OH (USA)
Barium cloud test in Peru. Interim report Mar-Apr 79, 7:58322 (AD-A—110051/0)

Properties of blends of polyphenylsulfone and acetylene terminated reactive plasticizer. Final report Oct 79-Jun 80, 7:57464 (AD-A—111393/5)

Air Pollution Technology, Inc., San Diego, CA (USA)

Laboratory/bench scale testing and evaluation of A.P.T. dry plate scrubber. Seventh quarterly progress report, September 1-November 30, 1981, 7:56032 (DOE/ET/15492—T23)

Akademie der Wissenschaften der DDR, Dresden. Zentralinstitut fuer Festkoerperphysik und Werkstofforschung

Fundamentals, fabrication, and properties of powder metallurgical materials. Part 1. Review papers, poster summaries, 7:57300 (INIS-mf—7095)

Fundamentals, fabrication, and properties of powder metallurgical materials. Part 2. Summaries, 7:57301 (INIS-mf—7096)

Fundamentals, fabrication, and properties of powder metallurgical materials. Part 3. Summaries, 7:57302 (INIS-mf—7097)

Akademie der Wissenschaften der DDR, Leipzig. Zentralinstitut fuer Isotopen- und Strahlenforschung

Proceedings of the KDT meeting on isotopes for rationalization in industry, 7:56429 (ZFI-Mitt—39)

Alabama Office of State Planning and Federal Programs, Montgomery (USA). State Planning Div.

Marketable energy resources in Alabama: a partially annotated research bibliography, 7:57093 (NP—2906080)

Alabama Univ., University (USA). School of Mines and Energy Development

Economic-impact study of the expanding coal-mining industry in Tuscaloosa County, Alabama, 7:56110 (NP—2903933)

Alaska Univ., College (USA). Inst. of Marine Science

Environmental assessment of the Alaskan continental shelf. Volume 4. Biological studies: distribution and abundance of some epibenthic invertebrates of the northeastern Gulf of Alaska with notes on the feeding biology of selected species. Final report, 7:58151 (PB—82-171760)

Alaska Univ., Palmer (USA). Agricultural Experiment Station

Revegetation of Alaskan coal mine spoils. Progress report for research, 7:56043 (DOE/EV/10256—2)

Allied-General Nuclear Services, Barnwell, SC (USA)

Coordination and display of nuclear facility technical and management data, 7:56392 (AGNS—35900-CONF-171)

Allis-Chalmers Corp., Pittsburgh, PA (USA). Overhead Distribution Transformer Div.

Distribution transformer tank pressure study. Final report, 7:56726 (EPRI—325)

Aluminum Co. of America, Alcoa Center, PA. Alcoa Labs.

Pulverized-coal firing of aluminum-melting furnaces. Fourth annual technical progress report, July 1981-June 1982, 7:56092 (DOE/CS/40037—T13)

Pulverized-coal firing of aluminum-melting furnaces. Quarterly technical progress report, January-April 1982, 7:56093 (DOE/CS/40037—T14)

American Association for the Advancement of Science, Washington, DC

Effect of increasing CO_2 on ocean biota. Volume II, Part 5. Environmental and societal consequences of a possible CO_2-induced climate change, 7:58148 (DOE/EV/10019—2-Vol.2)

American Crystal Sugar Co., Moorhead, MI. Research Center

Technical and economic feasibility of membrane technology. Final report, September 17, 1979-November 16, 1981, 7:56488 (BSDF—39-8Q-81)

American Iron and Steel Inst., Washington, DC

Information and data for use in preparation of a criteria document for coke producing operations, 7:56007 (PB—82-166539)

American Nuclear Society, La Grange Park, IL. Mathematics and Computation Div.

Advances in mathematical methods for the solution of nuclear engineering problems. Volume 1. Proceedings, 7:56919 (INIS-mf—6845)

American Univ., Washington, DC. Inst. for Applied Public Financial Management

Establishing a reliable source of fuel for Department of Defense requirements: Effective petroleum, oil, and lubricant financial managment. Final report, 7:56155 (PB—82-159005)

Requirements and alternatives for a management information system to support hazardous waste enforcement. Final report, 7:58143 (PB—82-154410)

Amherst Coll., MA (USA)

Isotope effects in the solution of gases in liquids. Progress report, July 1, 1981-July 30, 1982, 7:57578 (DOE/ER/05031—4)

Analysis and Inference, Inc., Boston, MA (USA)

Design, costs, and acceptability of an electric utility self-insurance pool for assuring the adequacy of funds for nuclear power plant decommissioning expense. Technical report, 7:56906 (NUREG/CR—2370)

Analytic Sciences Corp., Reading, MA (USA)

Recycling/disposal alternatives for depleted uranium wastes. Final report 12 Jun-12 Sep 80, 7:56256 (AD-A—108972/1)

AN Gruzinskoj SSR, Tbilisi. Inst. Fiziki

New method of investigating some nonlinear spectral equations, 7:58573 (VE—1-Preprint)

AN SSSR, Leningrad. Inst. Yadernoj Fiziki

Temperature breaking of hydrogen bonds in ammonia as studied by π^- meson capture in hydrogen, 7:58350 (JINR—R-14-81-534)

AN SSSR, Moscow

Summaries of reports, presented by foreign scientists. Volume 7, 7:57538 (INIS-SU—111)

Theoretical fundamentals of chemical technology. Chemical problems in metallurgy. Chemistry and technology of silicates. Volume 3. Annotations of reports and communications, 7:57655 (INIS-SU—99)

AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.

Dynamics of high turbulence of highly-hydrid waves in inhomogeneous electric field, 7:58882 (KFTI—81-35)

Electromechanical instability of oscillatory circuit in external electromagnetic field, 7:58787 (KFTI—80-50)

Integral methods of plasma equilibrium calculation in TOKAMAK, 7:58884 (KFTI—81-43)

Kinetics of neutral atoms in thermonuclear devices, 7:58883 (KFTI—81-36)

Magnetic field components of helical conductors with a current on a torus, 7:59008 (KFTI—81-44)

Main physical problems of "Uragan-3" device, 7:59009 (KFTI—81-45)

Technique of physical experiment, 7:58290 (KFTI—78-46)

Tuned sources of submillimetre radiation, 7:57793 (KFTI—81-41)

AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki

Model energy spectrum and thermodynamical properties of the electron gas in strongly anisotropic crystals: transitional region between three-dimensional (3D) and two-dimensional (2D) or one-dimensional (1D) structures, 7:58757 (ITF—81-3P)

Problem of three strongly interacting particles, two of which are charged, 7:58490 (ITF—80-122P)

Size effects in layer crystals, 7:58756 (ITF—80-138P)

Theory of electron transfer by solitons, 7:58755 (ITF—80-126P)

Architectural Alliance, Inc., Minneapolis, MN (USA)

Passive-solar-retrofit, Pfister residence. Final report, May 7, 1979-September 1, 1980, 7:56588 (DOE/CS/34146—T1)

Argonne National Lab., Idaho Falls, ID (USA)

Reaction rate calibration techniques at ZPPR for ^{239}Pu fission, ^{235}U fission, ^{238}U fission, and ^{238}U capture, 7:56786 (ZPR-TM—424)

Argonne National Lab., IL (USA)

Ethanol production via fungal decomposition and fermentation of biomass. Semiannual progress report, October 1981-March 1982, 7:56487 (ANL/EES-TM—187)

Optimal sizing of heating systems that store and use thermal energy, 7:57173 (ANL/SPG—18)

Sampling and detection of tagged dredged material, 7:58155 (ANL/EES-TM—169)

Arizona Energy Office, Phoenix (USA)

Commercial energy audit workbook with energy conservation retrofit measures, 7:57208 (NP—2903914)

Eucalyptus plantations for energy production in Hawaii. 1980 annual report, January 1980-December 1980, 7:56547 (DOE/ET/20074—T7)

Bituminous Coal Research, Inc., Monroeville, PA (USA)

Field survey of float dust in coal mining operations. Research report Mar 80-Mar 81, 7:56076 (PB—82-172719)

BKI Associates, Inc., McLean, VA (USA)

Study of the cost effectiveness of stationary source, mobile source and transportation controls to improve air quality. Final report Sep 79-Nov 81, 7:58085 (PB—82-167750)

Boeing Computer Services Co., Seattle, WA (USA)

Intermediate photovoltaic system application experiment operational performance report. Volume 8 for Lovington Square Shopping Center, Lovington, NM, 7:56559 (SAND—81-7085/8)

Intermediate photovoltaic system application experiment operational performance report. Volume 10. Lovington Square Shopping Center, Lovington, NM (USA), 7:56560 (SAND—81-7085/10)

Intermediate photovoltaic system application experiment operational performance report. Volume 7. Beverly High School, Beverly, MA, 7:56563 (SAND—81-7088/7)

Intermediate photovoltaic system apploication experiment operational performance report. Volume 10. Newman Power Station, El Paso, TX, 7:56561 (SAND—81-7086/10)

Boeing Computer Services Co., Tukwila, WA (USA). Energy Technology Applications Div.

EPRI generating-unit commitment and production-costing program. Volume 1. User's guide. Interim report, 7:57119 (EPRI-EL—2455-Vol.1)

EPRI generating-unit commitment and production-costing program. Volume 2. Programmer's guide. Interim report, 7:57120 (EPRI-EL—2455-Vol.2)

Bonnenberg und Drescher Ingenieurgesellschaft m.b.H., Aldenhoven (Germany, F.R.)
Analysis of the amount of energy and material used in the packing of liquid food and luxury food. Volume 2: Material flow charts to determine energy useage from the raw material down to the filling of packings in the individual production steps, 7:57246 (PB—82-158619)
Analysis of the amount of energy and material used in the packing of liquid food and luxury food. Volume 6: analysis of specific energies for transportation of some packing materials, 7:57248 (PB—82-158650)

Booz, Allen and Hamilton, Inc., Bethesda, MD (USA)
Great Lakes/St. Lawrence Seaway regional transportation study; Great Lakes area industries. Final report, 7:56080 (AD-A—111202/8)

Boston Coll., Chestnut Hill, MA (USA). Mass Space Data Analysis Lab.
Analysis of project EXCEDE II circular variable filter spectrometer data. Scientific report No. 1, 1 Jul 79-30 Sep 81, 7:58321 (AD-A—109894/6)

Brewer (C.) and Co. Ltd., Honolulu, HI (USA)
Feasibility study for Hilo Coast Processing Company, Pepeekeo, Hawaii: 11.4-million gallon-per-year motor-fuel-grade ethanol plant. Volume I. Executive summary, 7:56497 (DOE/RA/50323—1-Vol.1-Exec.Summ.)

British Columbia Univ., Vancouver (Canada). TRIUMF Facility
Annual report, scientific activities, 1979, 7:57847 (INIS-mf—7100)
Electric quadrupole moments and strong interaction effects in pionic atoms of ^{165}Ho, ^{175}Lu, ^{176}Lu, ^{179}Hf and ^{181}Ta, 7:58469 (INIS-mf—7099)

Brookhaven National Lab., Upton, NY (USA)
Advanced alkaline electrolysis-cell development, Contract summary report. Development of electrolysis operation cell separator for 125°C, 7:56435 (BNL—51573)
Flash hydropyrolysis of coal for conversion to liquid and gaseous fuels, 7:55985 (DOE/METC—82-48)
Formation and characterization of fission-product aerosols under postulated HTGR accident conditions, 7:56955 (BNL-NUREG—31557)
Harnessing the sun for development: actions for consideration by the international community at the UN Conference on New and Renewable Sources of Energy for promoting the use of renewable energy in developing countries, 7:56584 (BNL—51463)
High-level-waste containment for a thousand years: unique technical and research problems, 7:56293 (BNL-NUREG—31329)
Humoral regulation of erythropoiesis, 7:58222 (BNL—31593)
IBA in deformed nuclei, 7:58710 (BNL—31486)
Laser studies of radiationless decay mechanisms in Os^{2+}/$^{3+}$ polypyridine complexes, 7:57577 (BNL—31632)
LMFBR core design for low capital cost and low-sodium void, 7:56781 (BNL—30756)
Long-range attraction in the collisions of free-molecular and transition-regions aerosol particles, 7:58339 (BNL—31561)
Neutron-scattering study of Cs_2CoCl_4: a system of 1D, $S = 1/2$ XY antiferromagnetic chains with spin frustration, 7:57474 (BNL—31682)
Resonance-fluorescence kinetic study of oxygen atom + hydrocarbon reactions, V: O(^{3}P) + Neopentane (415-922K), 7:57687 (BNL—31559)
Safety research programs sponsored by Office of Nuclear Regulatory Research. Quarterly progress report, October 1-December 31, 1981, 7:56977 (NUREG/CR—2331-Vol.1-No.4)
Some aspects of low-level radioactive-waste disposal in the US, 7:56292 (BNL-NUREG—31328)
Strangeness exchange reactions and hypernuclei, 7:58606 (BNL—31674)
Synthetic inactivators of kallikrein, 7:58190 (BNL—30619)
Traditional computing center as a modern network node, 7:59075 (BNL—30609)
TRITOX: a multiple parameter evaluation of tritium toxicity, 7:58227 (BNL—31581)
Wiggler, undulator, and free-electron laser-radiation sources development at the National Synchrotron Light Source, 7:57913 (BNL—31570)

Brown and Caldwell, Walnut Creek, CA (USA)
United packing: Alcohol feasibility study. Final report, 7:56455 (PB—82-178476)

Brown Univ., Providence, RI (USA). Div. of Engineering
Combined macroscopic and microscopic approach to the fracture of metals. Annual progress report, 1981-1982, 7:57318 (DOE/ER/10556—91)

Brown, Vence and Associates, San Francisco, CA (USA)
Akron, Ohio recycle energy system project. Technical bulletin, 7:57235 (PB—82-172404)
Auburn, Maine solid waste energy recovery project. Technical bulletin, 7:57234 (PB—82-172388)
Madison, Wisconsin energy recovery project. Technical bulletin, 7:57238 (PB—82-172438)
Saugus, Massachusetts refuse energy systems company project. Technical bulletin, 7:57236 (PB—82-172412)

Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene
Comparison of the radiation exposure by radioactive emissions of conventional power plants and of nuclear power plants, 7:58117 (ISH—9)

Bureau of Mines, Amarillo, TX (USA). Helium Operations
A method for determining helium in water. Report of investigations 1981, 7:58089 (PB—82-179631)

Bureau of Mines, Reno, NV (USA). Reno Research Center
Extracting uranium from carbonaceous ores. Report of investigations/1981, 7:56250 (PB—82-158957)
Magnetic properties of alloys containing mischmetal, cobalt, copper, iron, and magnesium. Report of investigations/1981, 7:57375 (PB—82-158940)

Bureau of Mines, Spokane, WA (USA). Spokane Research Center
Fine coal-refuse slurry dewatering. Report of Investigations/1981, 7:56041 (PB—82-160268)

Bureau of Mines, Twin Cities, MN (USA). Twin Cities Research Center
Stress distribution and pillar design in oil shale retorts. Report of investigations, 7:56194 (PB—82-176256)

Bureau of Mines, Washington, DC (USA)
Uranium mine ventilaton costs. Information circular/1981, 7:56249 (PB—82-158577)

Bureau of Radiological Health, Rockville, MD (USA)
Radiation safety in nuclear medicine: a practical guide. Final report, 7:58237 (PB—82-159963)

Bureau of the Census, Washington, DC (USA)
Annual housing survey: 1978. United States and regions. Part F. Energy-related housing characteristics, 7:57196 (PB—82-175126)

Burns and Roe, Inc., Woodbury, NY (USA)
Preliminary assessment of alternative atmospheric fluidized-bed-combustion power-plant systems. Final report, 7:56705 (EPRI-CS—2275)

C

California Dept. of Conservation, Sacramento (USA). Div. of Oil and Gas
Heavy oil in California. Publication No. TR28, 7:56147 (NP—2905344)

California Dept. of Health Services, Berkeley (USA). Air and Industrial Hygiene Lab.
Size selective samplers for particulate monitoring in California. Final report, 7:58079 (PB—82-158312)

California Energy Resources Conservation and Development Commission, Sacramento (USA)
Directory of room air conditioners which comply with November 3, 1979 standards, 7:57188 (P—400-00-016)
Directory of room air conditioners which comply with November 3, 1979 standards, 7:57188 (P—400-00-016)
Local ordinances to improve energy efficiency of existing housing: a guide for local governments. Consultant report, 7:57189 (P—400-81-037)

California Solid Waste Management Board, Sacramento (USA)
Energy analysis of secondary material use in product manufacture, 7:57237 (PB—82-172420)

California Univ., Berkeley (USA)
Power-system transient-stability analysis: a Hamiltonian approach, 7:56724 (CONF-820549—2)

California Univ., Berkeley (USA). Dept. of Nuclear Engineering

Use of waste heat in district systems with considerations of seasonal-heat-demand variations, 7:57240 (UCB-NE—4022)

California Univ., Berkeley (USA). Inst. of Transportation Studies

Strategic perspective on public transportation in a time of uncertain petroleum supply. Research report (final), 7:57222 (PB—82-176918)

California Univ., Davis (USA). Lab. for Energy-Related Health Research

Nasal airway anatomy and inhalation deposition in experimental animals and people, 7:58219 (UCD—472-504)

California Univ., Los Angeles (USA). Dept. of Chemical, Nuclear, and Thermal Engineering

Use of expert opinion in the evaluation of probabilities of rare events, 7:56990 (UCLA-ENG—7834)

California Univ., Riverside (USA). Dept. of Physics

Calculation of electron-hydrogen, deuterium and oxygen molecules. Final report, April 1979-April 1980, 7:58336 (AD-A—110689/7)

California Univ., Riverside (USA). Statewide Air Pollution Research Center

Investigation of the role of natural hydrocarbons in photochemical smog formation in California. Final report 19 Jun 79-18 Sep 80, 7:58076 (PB—82-146309)

California Univ., San Diego, La Jolla (USA)

Effect of increasing CO_2 on ocean biota. Volume II, Part 5. Environmental and societal consequences of a possible CO_2-induced climate change, 7:58148 (DOE/EV/10019—2-Vol.2)

Cambridge Univ. (UK). Dept. of Engineering

Fracture-mechanism maps, 7:57377 (PB—82-178609)

Review of some formal methods for decision-making, 7:56321 (PB—82-176744)

Scope for increasing the efficiency of automotive engines through combustion research, 7:57283 (PB—82-176801)

Second report on sintering diagrams, 7:57376 (PB—82-170739)

Camp Dresser and McKee, Inc., Austin, TX (USA)

13(a) assessment of the Rio Grande Region. Final report, 7:58176 (PB—82-159948)

Process catalog for synfuel technologies in Texas, 7:56006 (PB—82-159955)

Water resources reference base for the 13(a) assessment of the Rio Grande Region. Technical memo, 7:58179 (PB—82-161787)

Water resources reference base for the 13a assessment of the texas portions of the texas gulf region and the red river basin. Technical memo, 7:56714 (PB—82-163668)

Camp Dresser and McKee, Inc., Wheat Ridge, CO (USA)

Permit requirements for development of energy and other selected natural resources for the State of Nevada, 7:57106 (USGS-OFR—81-1271)

Permit requirements for development of energy and other selected natural resources for the State of Arizona, 7:57101 (USGS-OFR—81-1250)

Permit requirements for development of energy and other selected natural resources for the State of California, 7:57103 (USGS-OFR—81-1252)

Permit requirements for development of energy and other selected natural resources for the State of Colorado, 7:57104 (USGS-OFR—81-1253)

Carnegie-Mellon Univ., Pittsburgh, PA (USA)

Solidification and solid state transformations of austenitic stainless steel welds, 7:57378 (SAND—82-8703)

Carrier Corp., Syracuse, NY (USA). Research Div.

Northern-climate heat-pump field-performance evaluation. Final report, 7:57181 (EPRI-EM—2319)

Case Western Reserve Univ., Cleveland, OH (USA)

Transient catalytic combustor model, 7:57840 (DOE/NASA/3230—1)

Case Western Reserve Univ., Cleveland, OH (USA). Dept. of Macromolecular Science

Structure determination of the macromonomer poly(1,11-dodecadiyne) and its crosspolymerized product. Technical report 1 Mar 81-27 Jun 82, 7:57703 (AD-A—111661/5)

Catalytic, Inc., Wilsonville, AL (USA)

Operation of the Wilsonville solvent-refined coal pilot plant: startup, calibration, and initial operation of the H-oil ebullated-bed hydrotreater unit. Technical evaluation, 7:55978 (DOE/ET/10154—103)

CEA Centre d'Etudes de Bruyeres-le-Chatel, 92 - Montrouge (France)

Study of the ^{208}Pb(n,γ_0) reaction between 0.8 and 5.9 MeV, 7:58687 (CONF-810920—24)

CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)

Boltzmann equation in 1D-spherical and cylindrical geometry. Specifications of the ORPHEE code, 7:58801 (CEA-N—2257)

Compendium of laser plasma interaction, 7:58819 (CEA-N—2242)

Proton beam - target interactions at low and high power densities, 7:58961 (CEA-CONF—6066)

Selected topics in low-energy fission, 7:58699 (CEA-CONF—5835)

Target fabrication using laser and spark erosion machining, 7:56424 (CEA-CONF—6075)

CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France)

Cations redistribution in mixed oxides (U,Ce)O_2 and (U,Pu)O_2 under thermal gradient, 7:56257 (CEA-R—5139)

Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipartimento Radiazioni e Ricerche di Sicurezza e Protezione

Evaluation of the dose to the Italian population from nuclear explosions, 7:58228 (CNEN-RT/PROT—(80)30)

Laboratory determination of the thermal properties of large-scale samples of natural clays, 7:56296 (CNEN-RT/ING—81-12)

Tritium levels in the blood and urine of the normal population and in contaminated subjects, 7:58229 (CNEN-RT/PROT—(80)37)

Comitato Nazionale per l'Energia Nucleare, Sede (Italy). Direzione Centrale Sicurezza Nucleare e Protezione Sanitaria

Security note (with special reference to the area of nuclear plants), 7:56956 (CNEN-RT/DISP—(80)1)

Commissariat a l'Energie Atomique, Brussels (Belgium)

European energy model: evaluation of the medium-term energy-demand case study - France, 1980, 7:57058 (EUR—7781-FR)

Commission of the European Communities, Brussels (Belgium)

Assessment of how the forest production which is currently not used would be obtained for energy purposes and from this an evaluation of the management methods most appropriate to the production of wood for energy purposes, 7:56507 (EUR—7550-EN)

Biophotolysis of water for H_2 production via natural and artificial catalytic systems, 7:56509 (EUR—7589-EN)

Development of a plant producing heat, mechanical and electrical energy by gasification of wood and straw in a 50 to 150 kW gasifier - 'gasification of pieces of biomass with efficiencies between 150 and 400 kW - design and construction of an experimental gasifier', 7:56460 (EUR—7558-DE)

Energy recovery by gasification of agricultural and forestry wastes in a co-current moving bed reactor, 7:56510 (EUR—7594-EN)

Genetic control of photosynthetic efficiency and hydrogen production in algae, 7:56508 (EUR—7554-EN)

Investigations into the oxidation of water and the reduction of nitrogen by photochemically generated redox-couples, 7:57698 (EUR—7609-DE)

Mutual orientation of pigments in photosystem I particles from green plants, 7:57697 (EUR—7592-EN)

Physics of plasmas close to thermonuclear conditions: proceedings, 7:58850 (EUR—6584-Vol.1)

Physics of plasmas close to thermonuclear conditions: proceedings, 7:58857 (EUR—6584-Vol.2)

Commission of the European Communities, Luxembourg

Analysis of the part-load operation of controlled ignition engines. Definition of the optimum courses of action with regard to energy output. Final report, 7:57287 (PB—82-162082)

Development of domestic heat pumps. Final report, 7:57207 (PB—82-180852)

Energy production from cereal straw, 7:56461 (EUR—7686-DE)

Energy saving in paper drying. Final report, 7:57228 (PB—82-162116)

Energy saving in paper drying. Final report, 7:57230 (PB—82-162488)

Energy saving in paper drying. Final report, 7:57249 (PB—82-156720)

Evaluation of attainable efficiencies and costs for generation of electricity from hydrogen, 7:56709 (EUR—7529-DE)

Galvanic high energy cells with molten electrolytes, 7:57290 (EUR—7072-DE)

Importance of hydrogen in future energy demand and supply. Final report, 7:56441 (PB—82-157611)

Novel diaphragm for electrolytic cells. Final report, 7:57711 (PB—82-168006)

Study of finned tube heat exchangers for air water media operating at low Reynolds numbers and applied to the design of low temperature convectors for domestic heating. Final report, 7:56673 (PB—82-162090)

Technical and economic possibilities for waste heat utilization in aluminium production, 7:57226 (EUR—7387-DE)

CONCAWE, The Hague (Netherlands)

The rational utilisation of fuels in private transport (RUFIT): extrapolation to unleaded gasoline case, 7:56175 (PB—82-174285)

Connecticut Univ., Storrs (USA)

Human serum teratogenicity studies using in vitro cultures of rat embryos, 7:58247 (CONF-820122—8)

Connecticut Univ., Storrs (USA). Dept. of Animal Genetics

Embryo culture in teratological surveillance and serum proteins in development. Progress report, 1981-1982, 7:58248 (DOE/EV/03139—46)

Embryo culture in teratological surveillance and serum proteins in development. Comprehensive fourteen year report, 1968-1982, 7:58223 (DOE/EV/03139—47)

Conoco Coal Development Co., Library, PA (USA). Research Div.

Recycle slurry-oil characterization. First annual report, October 1, 1980-September 30, 1981, 7:55996 (DOE/PC/30027—24)

Consulting Professionals, Inc., Santa Fe, NM (USA)

National uranium resource evaluation: Dalhart Quadrangle, Texas, New Mexico, Oklahoma, Colorado, and Kansas, 7:56246 (PGJ/F—081-82)

Cook Inlet Region, Inc./Placer Amex, Inc., San Francisco, CA (USA)

Coal to methanol feasibility study: Beluga methanol project. Volume IV. Environmental. Final report, 7:56452 (DOE/RA/50299—1119-Vol.4)

Bibliography of Soviet laser developments, November-December 1980, 7:57781 (AD-A—110837/2)

Delaware Univ., Newark (USA). Dept. of Chemical Engineering
Development of superior denitrogenation and isomerization catalysts for processing crude oil derived from shale. Part II. Final report, 7:56193 (AD-A—111559/1)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Eighth quarterly report, June 15, 1980-September 15, 1980, 7:55981 (DOE/ET/11429—8)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Eleventh quarterly report, March 15, 1981-September 15, 1981, 7:55983 (DOE/ET/11429—11)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Ninth quarterly report, September 15, 1980-December 15, 1980, 7:55982 (DOE/ET/11429—9)

Democritus Nuclear Research Center, Athens (Greece)
Phytoplankton ecology of the Saronicos Gulf, Aegean Sea. Data report - Year 1981, Part 1: hydrography, 7:58147 (DEMO—82/1)

Department of Agriculture, Washington, DC (USA)
Blast effects on tree stand, 7:58034 (AD—465294/7)

Department of Energy, Argonne, IL (USA). New Brunswick Lab.
Minutes of the fourth SALE program participants meeting, 7:56393 (CONF-810738—)

Department of Energy, Bartlesville, OK (USA). Bartlesville Energy Technology Center
Contracts for field projects and supporting research on enhanced oil recovery and improved drilling technology. Progress review No. 29, quarter ending December 31, 1981, 7:56144 (DOE/BETC—82/1)
Western Gas Sands Project: Los Alamos NMR well-logging tool development, 7:56118 (DOE/BC/10018—20)

Department of Energy, Morgantown, WV (USA). Morgantown Energy Technology Center
Field project to obtain pressure core, wireline log, and production test data for evaluation of CO_2 flooding potential. Conoco MCA unit well No. 358, Maljamar Field, Lea County, New Mexico. Final report, 7:56145 (DOE/MC/08341—43)

Department of Energy, Pittsburgh, PA (USA). Pittsburgh Energy Technology Center
Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
Fischer-Tropsch studies with catalyst-sprayed tube wall reactors, 7:56447 (DOE/PETC/TR—82/14)
Study of the Fischer-Tropsch reaction using on-line gas-chromatographic analysis, 7:56000 (DOE/PETC/TR—82/10)

Department of Energy, San Francisco, CA (USA). San Francisco Operations Office
1982 annual heavy oil/EOR contractor reports-proceedings, 7:56121 (CONF-820712—)

Department of Energy, Washington, DC (USA)
Contracts for field projects and supporting research on enhanced oil recovery and improved drilling technology. Progress review No. 29, quarter ending December 31, 1981, 7:56144 (DOE/BETC—82/1)
Technology spin-offs from the magnetic fusion energy program, 7:58814 (DOE/ER—0132)
U.S. Ethanol Corporation: loan-guarantee application, 7:57129 (DOE/EA—0164)

Department of Energy, Washington, DC (USA). Energy Information Administration
US imports and exports of natural gas, 1981, 7:56181 (DOE/EIA—0188-81)

Department of Energy, Washington, DC (USA). Office of Nuclear Energy Programs
Alloy steel bars and shapes (ASME SA-479 with additional requirements), 7:56936 (NE-M—7-3T-Rev.-8-82)
Bare carbon steel electrodes and fluxes for submerged arc welding (ASME SFA-5.17 with additional requirements), 7:56933 (NE-M—1-17T-Rev.-8-82)
2-1/4%-chromium, 1%-molybdenum alloy steel tubesheet forgings (ASME SA-336 with additional requirements), 7:56932 (NE-M—2-19T-Rev.-8-82)
Class 1 nuclear components (supplement to ASME Boiler and Pressure Vessel Code, Section III, Subsections NCA and NB), 7:56904 (NE-E—15-2NB-T-Rev.-8-82)
Low-alloy-steel-covered welding electrodes (ASME SFA-5.5 with additional requirements), 7:56935 (NE-M—1-4T-Rev.-8-82)
Martensitic stainless steel (type 403) forgings (ASME SA-182 with additional requirements), 7:56903 (NE-M—2-6T-Rev.-8-82)
Mild steel covered welding electrodes (ASME SFA-5.1 with additional requirements), 7:56902 (NE-M—1-3T-Rev.-8-82)
Nickel alloy forgings (ASME SB-564 with additional requirements), 7:56934 (NE-M—2-20T-Rev.-8-82)

Department of Transportation, Cambridge, MA (USA). Transportation Systems Center
A computer program (HEVSIM) for heavy duty vehicle fuel economy and performance simulation. Volume I: Description and analysis. Final report Mar-Oct 80, 7:57219 (PB—82-164575)
A computer program (HEVSIM) for heavy duty vehicle fuel economy and performance simulation. Volume II: Users' manual. Final report Mar-Oct 80, 7:57220 (PB—82-164583)
A computer program (HEVSIM) for heavy duty vehicle fuel economy and performance simulation. Volume III: Appendices A through F. Final report Mar-Oct 80, 7:57221 (PB—82-164591)
Computer simulations and literature survey of continuously variable transmissions for use in buses. Final report, June-December 1981, 7:57294 (PB—82-156795)
Fuel-economy and exhaust-emissions characteristics of diesel vehicles: test results of a prototype Chrysler Volare, 225 CID (3.7-liter) automobile, 7:57212 (DOE/NASA—2817-3)
Interim assessment of the VAL automated guideway transit system. Interim report, 7:57218 (PB—82-163783)
Potential for energy cost reductions in 'Hamilton Class' cutters through fuel modification. Final report, 7:57295 (AD-A—111103/8)
The effect of light truck design variables on top speed, performance, and fuel economy, 1981. Final report Oct 80-Sep 81, 7:57215 (PB—82-150426)

Deutsche Babcock A.G., Oberhausen (Germany, F.R.)
Construction and operation of a prototype RESOX plant in conjunction with Bergbau-Forschung FGD system. Final report, 7:56039 (EPRI-CS—2467)

Devres, Inc., Washington, DC (USA)
The socio-economic context of fuelwood use in small rural communities. Evaluation special study No. 1, 7:56515 (PB—82-159070)

Diamond Oil Well Drilling Co., Midland, TX (USA)
Improvement of drilling capabilities of PDC cutters in hard formation. Final report, 7:57757 (DOE/BC/10364—24)

Dominion Engineering, Inc., McLean, VA (USA)
Assessment of BWR fuel-channel lifetimes. Final report, 7:56748 (EPRI-NP—2483)

Florida State Univ., Tallahassee (USA)
Configurational testing of electron-beam ionization for coal-fly-ash precipitators. Quarterly report No. 4, September 2-December 1, 1981, 7:56035 (DOE/MC/16229—T4)
Design of experiments to assess gas-composition effects on electron-beam ionization, 7:57843 (CONF-820256—1)

Florida Univ., Gainesville (USA)
X-ray line broadening as a diagnostic in laser-produced plasmas. Progress report, 7:58824 (DOE/DP/40016—T3)

Florida Univ., Gainesville (USA). Dept. of Coastal and Oceanographic Engineering
Storm-surge measurements and computations for Hurricane David, 7:58149 (NUREG/CR—2860)

Florida Univ., Gainesville (USA). Dept. of Physics
Low-frequency electric-microfield distributions in a plasma containing multiply-charged ions: extended calculations, 7:58822 (DOE/DP/40016—T1)

Florida Univ., Gainesville (USA). Dept. of Physics and Astronomy
Study of stark broadening of high-Z hydrogenic ion lines in dense hot plasmas, 7:58823 (DOE/DP/40016—T2)
X-ray line broadening as a diagnostic in laser-produced plasmas, 7:58825 (DOE/DP/40016—T4)

Florida Univ., Gainesville (USA). Solar Energy Lab.
Mobile home air conditioning and energy consumption test: zone 1. Final report, 7:57198 (PB—82-175779)

Foersvarets Forskningsanstalt, Stockholm (Sweden)
Common data base experiment: progress report on data analysis, 7:58276 (FOA-C—20431-T1)

Forschungsstelle fuer Energiewirtschaft, Muenchen (Germany, F.R.)
Analysis of the amount of energy and material used in the packing of liquid food and luxury food. Volume 3: The summarized, specific energy consumption and possibilities to control it, 7:57247 (PB—82-158627)

Forsvarets Forskningsanstalt - FOA, Stockholm (Sweden)
Internal seismological stations for monitoring a Comprehensive Test Ban Treaty, 7:58055 (FOA-C—20358-T1-Rev.)

Forsvarets Forskningsinstitutt, Kjeller (Norway)
Spacecraft and stellar occulations by turbulent planetary atmospheres: a theoretical investigation of various wave propagation effects and their impact on derived profiles of refractivity, temperature, and pressure, 7:58302 (NDRE/PUBL—81/1002)

Foster-Miller Associates, Inc., Waltham, MA (USA)
Evaluation of the Kloswall longwall mining system. Final report, 7:56064 (DOE/ET/12489—T1)

Foster Wheeler Energy Corp., Livingston, NJ (USA)
Construction and operation of a prototype RESOX plant in conjunction with Bergbau-Forschung FGD system. Final report, 7:56039 (EPRI-CS—2467)

Frankfurt Univ. (Germany, F.R.). Inst. fuer Kernphysik
Annual Report 1981, 7:58584 (IKF—41)

Franklin Research Center, Philadelphia, PA (USA)
Assessment of center-line lack of penetration in stainless steel pipe (ASTM A-312, ASME SA-312). Final report Feb 80-Sep 81, 7:56976 (NUREG/CR—2263)

Fraunhofer-Gesellschaft zur Foerderung der Angewandten Forschung e.V., Garmisch-Partenkirchen (Germany, F.R.). Inst. fuer Atmosphaerische Umweltforschung
Balance of the tropospheric ozone and its relation to stratospheric intrusions indicated by cosmogenic radionuclides. Technical progress report, November 1, 1981-June 30, 1982, 7:58058 (DOE/ET/03425—22)

FW Energy Applications, Inc., Livingston, NJ (USA)
Component development for duplex tube steam generator for large LMFBR plant. Final report, 7:56783 (EPRI-NP—2316)

G

Gamze-Korobkin-Caloger, Inc., Chicago, IL (USA)
Operator's report on the Summit Plaza total energy plant in Jersey City, New Jersey, 7:57274 (PB—82-175316)

Gas-Cooled Reactor Associates, La Jolla, CA (USA)
High-Temperature Gas-Cooled Reactor Steam Cycle/Cogeneration Lead Project strategy plan, 7:56915 (DOE/SF/02034—T78)
High-temperature process heat 950°C DC vs. 850°C IDC baseline plant cost comparison, 7:56918 (DOE/SF/02034—T64)
HTGR high temperature process heat design and cost status report. Volume II. Appendices, 7:56913 (DOE/SF/02034—T44Vol.2)
HTGR high temperature process heat design and cost status report. Volume III. Appendices, 7:56914 (DOE/SF/02034—T44Vol.3)
Program prioritization system user requirements document for Gas Cooled Reactor Associates, 7:56769 (DOE/SF/02034—T66)

General Accounting Office, Washington, DC (USA). Energy and Minerals Div.
Pitfalls in Interior's new accelerated offshore leasing program require attention, 7:56173 (PB—82-158064)
Strategic Petroleum Reserve: Substantial progress made, but capacity and oil quality concerns remain. Report to the Congress, 7:56177 (PB—82-152224)

General Atomic Co., San Diego, CA (USA)
History of and prospects for gas-cooled reactors in the United States, 7:56771 (GA-A—16637)
HTGR nuclear heat source component design and experience, 7:56916 (GA-A—16746)

General Electric Co., Philadelphia, PA (USA). Advanced Energy Programs Dept.
Analysis of small commercial photovoltaic applications, 7:56565 (SAND—81-7172)
Design and development of a high-concentration photovoltaic concentrator, 7:56519 (SAND—81-7007)
Identifying electrical loads which can use direct photovoltaic dc power, 7:56557 (SAND—80-7012)

General Electric Co., Pittsfield, MA (USA). Large Power Transformer Dept.
Basic transformer-life characteristics. Volume 2. Evaluation of a Fluoroptic /sup TM/ thermometer as a hot-spot sensor for power transformers. Final report, 7:56730 (EPRI-EL—2443-Vol.2)
Basic transformer-life characteristics. Volume 1. Overload characteristics and life-test evaluation. Final report, 7:56729 (EPRI-EL—2443-Vol.1)

General Electric Co., Schenectady, NY (USA)
Ceramic materials for fusion reactors. Final report, 7:58969 (EPRI-AP—2515)
Cool water coal gasification program. First annual progress report. Interim report, 7:56703 (EPRI-AP—2487)

General Electric Co., Schenectady, NY (USA). Corporate Research and Development Center
Phototransistor switch for breaker applications. Final report, 7:56728 (EPRI-EL—2395)

General Electric Co., Schenectady, NY (USA). Electric Utility Systems Engineering Dept.
Long-term power system dynamics, Phase III. Volume 2. LOTDYS user's guide. Final report, 7:56727 (EPRI-EL—983-Vol.2)

General Electric Co., Schenectady, NY (USA). Gas Turbine Div.
Development of high-temperature turbine subsystem technology to a technology readiness status Phase II. Quarterly report, January-March 1982, 7:56702 (DOE/ET/10340—134)
High-temperature turbine technology program hot-gas path development test. Part II. Testing, 7:56701 (DOE/ET/10340—132)
Low NO/sub x/ Heavy Fuel Combustor Concept Program. Phase I. Final report, 7:57838 (DOE/NASA/0147—1)

General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.
MRS reformer design and heat balance, 7:56912 (DOE/ET/34034—T12)

General Motors Corp., Indianapolis, IN (USA). Detroit Diesel Allison Div.
Low NO/sub x/ heavy fuel combustor concept program, 7:57839 (DOE/NASA/0148—1)

General Technology Applications, Inc., Arlington, VA (USA)
Investigation of the application of a cryogenic blending process to produce antimisting diesel fuels. Final report, 7:56174 (AD-A—110917/2)

Geological Survey, Charleston, WV (USA). Water Resources Div.
Water resources data for West Virginia, water year 1980. Appendix - coal areas. Water-data report 1 Oct 1970-30 Sep 1980, 7:58175 (PB—82-159674)

Geological Survey, Denver, CO (USA)
Geologic, geophysical, and in-situ stress investigations in the vicinity of the Dining Car chimney, Dining Car/Hybla Gold Drifts, Nevada Test Site, 7:58049 (USGS-OFR—82-137)

George Washington Univ., Washington, DC (USA). Program in Logistics
Sensitivity and parametric bound analysis of an electric power generation gp model: optimal steam turbine exhaust annulus and condenser sizes. Scientific report, 7:56698 (AD-A—110551/9)

George Washington Univ., Washington, DC (USA). School of Engineering and Applied Science
Multiangular scanning absorption-emission techniques for three dimensional combustion diagnostics. Annual report 1 Sep 80-30 Aug 81, 7:57742 (AD-A—109060/4)

Georgia Inst. of Tech., Atlanta (USA). Coll. of Architecture
Passive cooling for hot humid climates, 7:56585 (CONF-811109—5)

Georgia Inst. of Tech., Atlanta (USA). Research Inst.
Dissipative effects in the beam-beam interaction of intersecting storage rings, 7:57860 (DOE/ER/40003—1)

Georgia Univ., Athens (USA). Dept. of Chemistry
Fundamental studies of separation processes. Technical progress report, 15 August 1981-14 August 1982, 7:57543 (DOE/ER/00854—38)

Geothermal Resources Council, Davis, CA (USA)
Geothermal potential of the Cascade Mountain Range: exploration and development. Special report No. 10, 7:56624 (CONF-810572—)

Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.)
Report of the colloquium 1980 of the GSF Institut fuer Oekologische Chemie, 7:58124 (GSF-OE—599)

Gibbs and Hill, Inc., New York (USA)
Evaluation of Gulf Oil Corporation petition for permanent exemption from the Fuel Use Act for new steam generating facilities at Alliance Refinery Belle Chasse, Louisiana, 7:56153 (DOE/RG/10071—T1)

Gilbert Associates, Inc., Gaithersburg, MD (USA)
Comparative analysis of the Conceptual-design Studies of Potential Early Commercial MHD power plants (CSPEC), 7:57141 (DOE/NASA/10769—26)

Gilbert/Commonwealth, Reading, PA (USA)
Summary of repository siting models. Final report, 7:56316 (NUREG/CR—2782)

Goettingen Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet
Angular momentum distribution of primary fission fragments by measurement of the relative yield of isomeric fission products, 7:58704 (INIS-mf—7142)

Goodman Equipment Corp., Chicago, IL (USA)
Monorail bridge conveyor. Phase II report, 7:56065 (DOE/ET/13346—T61)

Goodyear Atomic Corp., Piketon, OH (USA)
Corrosion in coal-fired boilers, 7:56710 (GAT-S—24/Rev.1)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii
Helium flaking in metals and alloys promising as first-wall materials in fusion reactors, 7:57322 (IAE—3379/8)
Method of calculating collective dose irradiation in region of radioactive source, 7:58232 (IAE—3401/3)
Problems of formation of neutron-optical image with the help of very slow neutrons, 7:58595 (IAE—3409/14)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki
Analysis of angular dependences of inclusive cross sections of proton and light ion production on nuclei in the region of limiting target fragmentation, 7:58670 (ITEF—76(1980))
"Asymptotic freedom" in quantum mechanics, 7:58779 (ITEF—82(1980))
Coulomb problem with a short-range interaction. Bound states and resonances, 7:58719 (ITEF—98(1981))
Definition of the measurement accuracy of the microobject spatial coordinates recorded by the focused image holography, 7:57987 (ITEF—105(1981))
Electromagnetic form-factors of hadrons at large Q^2 and effects of confinement, 7:58487 (ITEP—79(1980))
Energy dependence of a conversion length of gamma quanta in liquid xenon in the 25-2400 MeV range, 7:58742 (ITEF—97(1981))
Equipment of fast reversing of polarization of the polarized thermal neutron beam, 7:58598 (ITEF—46(1981))
Hadronic mass-relations from topological expansion and string model, 7:58486 (ITEP—78(1980))
Instanton solutions in chiral models, 7:58538 (ITEF—66(1980))
Introduction to quantum chromodynamics. Deep inelastic scattering of leptons on nucleons, 7:58485 (ITEF—77(1981))
Investigation of characteristics of a spin flipper in form of a foil with current, 7:58743 (ITEF—100(1981))

Mechanisms of forward-backward spectator asymmetry in low-energy anti pD annihilation, 7:58489 (ITEP—96(1981))
Properties and interactions of neutrino (1977-1980) beam dump experiments, 7:58424 (ITEF—88(1981))
Rishon gauge theory, 7:58539 (ITEP—73(1981))
SU(3)-mixing of the S-wave dibaryon resonance, 7:58488 (ITEP—89(1981))

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.
Representation of particle space distribution by Fourier series in the Monte Carlo method, 7:58738 (FEI—1199)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij
Average multiplicities in hard processes, 7:58468 (IFVE-OTF—81-157)
Collective coordinate method in the relativistic string theory, 7:58551 (IFVE-OTF—81-101)
Collective coordinates on symplectic manifolds, 7:58773 (IFVE-OTF—81-49)
Comparison of strange antibaryon and strange meson production in K^+p interactions at 32 GeV/c, 7:58419 (IFVE-OEIPK—81-72)
Doublet composite schemes of leptons and quarks, 7:58464 (IFVE-OTF—81-99)
Einstein formula for gravitation radiation is not a consequence of the general relativity theory, 7:58776 (IFVE-OTF—81-141)
Elastic scattering model of hadrons with large momentum transfers, 7:58459 (IFVE-OTF—80-173)
Homogeneous point canonical transformation in the path integral, 7:58775 (IFVE-OTF—81-102)
Inclusive Ksup(*+)(1430), Ksup(*0)(1430) and f(1270) production in K^+p interactions at 32 GeV/c, 7:58422 (IFVE-ONF—81-71)
Invariant current algebra on the light cone and deep inelastic lepton-hadron scattering. Part 1, 7:58465 (IFVE-OTF—81-103)
Mean associative multiplicities in deep inelastic processes, 7:58466 (IFVE-OTF—81-116)
Possibility of dynamical arising of fermion mass in QCD, 7:58460 (IFVE-OTF—81-28)
Quark jets from antineutrino interactions. 2. Inclusive particle spectra and multiplicities in the quark jets, 7:58423 (IFVE-ONF—81-94)
Quark-parton model and charge-exchange reaction at large momentum transfer, 7:58463 (IFVE-OTF—81-96)
Quasielastic neutrino scattering νsub(μ)+n→μsup(-)+p at 2-20 GeV in bubble chamber SCAT, 7:58458 (IFVE-ONF—81-144)
Scaling violation in the heavy quark fragmentation functian, 7:58462 (IFVE-OTF—81-79)
Scattering at fixed angles with account for exchange interaction, 7:58461 (IFVE-OTF—81-75)
Study of inclusive production of π^{+-} mesons and protons in pp interactions at 32 GeV/c, 7:58420 (IFVE-OEIPK—81-111)
Study on longitudinal correlations between pions in fragmentation regions of primary hadrons in K^-p interactions at 32 GeV/c, 7:58421 (IFVE-OEIPK—81-112)
ν/sub (μ)/N→μ^-Nπ reactions in the hard pion model, 7:58467 (IFVE-OTF—81-143)
Trigonometric and Ssub(N)-symmetric solutions of triangle equations with variables on the faces, 7:58774 (IFVE-OTF—81-91)

Greater Egypt Regional Planning and Development Commission, Carbondale, IL (USA)
Impact of alternate energy sources in the greater Egypt region. Final report, 7:56051 (PB—82-181090)

Growth Systems Management, Inc., Gainesville, FL (USA)
Marginal-cost pricing under uncertainty. Final report, 7:57118 (EPRI-EA—2491)

Gruy Federal, Inc., Houston, TX (USA)
Field project to obtain pressure core, wireline log, and production test data for evaluation of CO_2 flooding potential. Conoco MCA unit well No. 358, Maljamar Field, Lea County, New Mexico. Final report, 7:56145 (DOE/MC/08341—43)

Gulf Research and Development Co., Pittsburgh, PA (USA)
Syntheses of synthetic hydrocarbons via alpha olefins. Final report Jul 80-Jun 81, 7:56445 (AD-A—110380/3)
Underground gasification for steeply dipping coal beds: Phase III. Quarterly progress report, April 1-June 30, 1981, 7:55984 (DOE/ET/13108—81)

Midwest appropriate-technology small grants program. Semiannual technical progress report, 7:56590 (DOE/R5/10223—3)

Indiana Univ., Bloomington (USA). Dept. of Physics
Optical pumping studies of collisional interactions. Final scientific report, 7:58335 (AD-A—110309/2)

Indian Council of Medical Research, New Delhi
Manual of Standards of Quality for Drink Water Supplies (second edition), 7:58161 (PB—82-167677)

Institut d'Aeronomie Spatiale de Belgique, Brussels
The internal structure of the magnetopause, 7:58327 (AERONOMICA-ACTA-A—221-1980)

Institute of Gas Technology, Chicago, IL (USA)
Operation of the ash-agglomerating gasifier. July 1976-December 1977 and April 1979-July 1980, final report, 7:55979 (DOE/ET/10237—1)

Institute of Geological Sciences, London (UK)
Geological reconnaissance study of the Dyfi Valley region, Gwynedd/Powys, Wales, 7:56303 (ENPU—81-1)
Geomechanical properties of rocks from the Altnabreac area, 7:58281 (ENPU—80-13)

Institute of Nuclear Energy Research, Lung-Tan (Taiwan)
Study of chromosome aberration yield in human lymphocytes as an indicator of radiation dose, 7:58233 (INER—0388)

Institute of Nuclear Physics, Krakow (Poland)
Cluster properties of the giant monopole resonances EO in the light and medium mass nuclei, 7:58718 (INP—1129/PL)
Computer simulation of nuclear experiment with the ^{8}Be nucleus detection, 7:58668 (INP—1094/PL)
Projectile fragmentation in hadron-nucleus collisions at high energies, 7:58484 (INP—1109/PH)
Study of the properties of nuclei far from the beta stability line, 7:58685 (INP—1108/PL)
Uncertainty of the shape of the local optical model potential, 7:58717 (INP—1127/PL)

Institut National de Physique Nucleaire et de Physique des Particules, 75 - Paris (France)
Grand unified theories and their cosmological consequences, 7:58296 (IN2P3—80-9-Vol.1)

Instituut voor Kernphysisch Onderzoek, Amsterdam (Netherlands)
IKO annual report, 1980, 7:58593 (NP—2902902)

Integrated Sciences, Inc., Longmont, CO (USA)
- Microseismic roof fall warning system development: field trials and commercial prototype fabrication. Volume I. Open file report (final) Aug 77-Dec 79, 7:56067 (PB—82-137837)
- Microseismic roof fall warning system development: field trials and commercial prototype fabrication. Volume II. Appendix C: coal mine data collection summary. Open file report (final) Aug 77-Dec 79, 7:56068 (PB—82-137845)

International Atomic Energy Agency, Vienna (Austria)
- Effect of stimulated fission products on the structure and the mechanical properties of Zircaloy. Final report for the period 15 December 1979 - 14 December 1981, 7:57323 (IAEA-R—2531-F)
- Study of leakages at dam sites in fractured rocks with the aid of the borehole dilution technique. Final report for the period 15 December 1975 - 14 December 1977, 7:58165 (IAEA-R—1757-F)

International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee
- Progress in fission product nuclear data. Information about activities in the field of measurements and compilation/evaluations of fission product nuclear data (FPND), 7:58585 (INDC(NDS)—116/GandP(No.7))

International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section
- International Reactor Dosimetry File (IRDF-82), 7:58665 (IAEA-NDS—42/R)

International Centre for Theoretical Physics, Trieste (Italy)
- Comparison, existence, uniqueness and successive approximations for ordinary and elliptic boundary value problems, 7:58772 (IC—79/13)
- Comparison, existence, uniqueness and successive approximations for two-point boundary value problems, 7:58805 (IC—79/11)
- Confinement, perturbation theory and Sterman-Weinberg jets, 7:58454 (IC—79/5)
- Dynamical quark mass and the U(1) problem, 7:58456 (IC—79/7)
- Existence and uniqueness results for boundary value problems from the comparison of eigenvalues, 7:58808 (IC—79/15)
- Existence of positive solutions for non-linear elliptic equations, 7:58804 (IC—79/10)
- Flavour and spin structure of linear baryons, 7:58457 (IC—79/8)
- Heavy quark and magnetic moment, 7:58455 (IC—79/6)
- Priori bounds for solutions of two-point boundary value problems using differential inequalities, 7:58803 (IC—79/9)
- Two fixed-point theorems related to eigenvalues with the solution of Kazdan-Warner's problem on elliptic equations, 7:58807 (IC—79/14)
- Two remarks on the stability of ordinary differential equations, 7:58806 (IC—79/12)

International Coal Refining Co., Allentown, PA (USA)
- SRC-I quarterly technical report, October-December 1981, 7:55986 (DOE/OR/03054—6)

International Energy Agency Coal Research, London (UK)
- Solvent extraction of coal, 7:56025 (PB—82-183450)

International Engineering Co., Inc., Denver, CO (USA)
- Water assessment of Cathedral Bluffs shale oil demonstration project, White River basin - Colorado, 7:56218 (PB—82-156738)
- Water assessment report on Cathedral Bluffs Shale Oil Demonstration Project, White River Basin - Colorado, 7:56219 (PB—82-159831)

- Physical design considerations of the next tokamak fusion reactor. Parameter survey of the device size, 7:59007 (JAERI-M—9577)
- Thermal stress analysis on the extraction grid. Exit grid for JT-60 NBI, 7:59006 (JAERI-M—9539)

JAYCOR, Alexandria, VA (USA)
- Ion diode research on the Aurora accelerator. Final report 5 Jan 81-5 Jan 82, 7:58960 (AD-A—111663/1)

JAYCOR, San Diego, CA (USA)
- Computer modeling of mixing and agglomeration in coal-conversion reactors. Volume I. Model formulation. Final report, September 15, 1978-February 28, 1982, 7:55980 (DOE/ET/10329—1211-Vol.1)

JBF Scientific Corp., Wilmington, MA (USA)
- Analysis of the effects of integrating wind turbines into a conventional utility: a case study. Final report, 7:56682 (PNL—3962)

Jet Propulsion Lab., Pasadena, CA (USA)
Investigation of the effect of wind cooling on photovoltaic arrays, 7:56493 (DOE/JPL—1012-69)
Proceedings of the second international colloquium on drops and bubbles, 7:59014 (NASA-CR—168848)
Upgrading demonstration vehicle task report, 7:57289 (DOE/CS/54209—5)
Workshop on an assessment of gas-side fouling in fossil-fuel-exhaust environments, 7:57225 (DOE/ID/12138—1)

Johannessen and Girand Consulting Engineers, Inc., Tucson, AZ (USA)
Feasibility study for geothermal-water space heating for the Safford Federal Prison Camp, Safford, Arizona, 7:56670 (DOE/ET/27256—T34)

Joint Inst. for Nuclear Research, Dubna (USSR)
Proceedings of the 10. International Symposium on Nuclear Electronics, 7:57992 (ZfK—433(v.2))

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation
Base software for anti dp-experiment on the CDC-6500 computer, 7:57989 (JINR-R—10-81-638)
Negative pion capture in atomic nuclei near the closed neutron shell at N=82, 7:58672 (JINR—E-15-81-270)
Nonlinear Schroedinger equation with U(p,q) isotopical group. 2. The U(1,1) system, 7:58781 (JINR—E-2-81-540)
Polyspheroidal wave functions, 7:58786 (JINR—R-5-81-372)
Simulation of baryon like quark bound states with $V(r)=-g^2r^{-1}(1-a^2r^2)$, 7:58498 (JINR—R-2-81-553)
Software for investigations of inclusive reactions in anti pp interactions, 7:57990 (JINR-R—10-81-670)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy
Comparison of the jet behaviour of hadrons in πsup(-1) interactions at 40 GeV/c with hadron production in e^+e^- annihilation, 7:58428 (JINR—R-1-81-542)
Correction of the fermion Green function, 7:58810 (JINR—R-2-81-633)
Energy-dependence of the proton emission and pion production intensity distribution in pion-xenon nucleus collisions, 7:58671 (JINR—E-1-81-578)
Heat capacity and upper critical magnetic field of Nb-Ti alloys after helium implantation and heat treatment, 7:57364 (JINR-R—8-81-182)
Inclusive production of π^- mesons in np interactions at 3.83 GeV/c, 7:58426 (JINR—R-1-81-437)
Minimized economical interactions, 7:58495 (JINR—R-2-81-369)
Scaling of the rapidity distributions in the π^-p interactions at Psub(πsup(-))=40 GeV/c, 7:58429 (JINR—R-2-81-487)
Search for decays of superdense nuclei in a two-meter propane chamber, 7:58651 (JINR-R—1-81-258)
Some methodical problems of interference investigation of identical pions produced in multiparticle processes at high energy, 7:58427 (JINR—R-1-81-496)
Sources of leading pions in π^+p and π^-p interactions at 16 and 40 GeV/c, 7:58425 (JINR—R-1-81-429)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics
Experimental investigation of polarizing mirror neutron guides. Neutron-optical characteristics, 7:57988 (JINR—R-3-81-546)
Spin dependence of S-wave neutron scattering cross section on ^{7}Li, 7:58623 (JINR-R—3-81-371)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems
Approximate solution of QCD evolution equations with radiative corrections, 7:58499 (JINR—R-2-81-557)
Dynamics of colour in hadron-diffraction on nuclei, 7:58491 (JINR—E-2-81-251)
Properties of ^{135}La excited states, 7:58673 (JINR-R—6-81-565)
Temperature breaking of hydrogen bonds in ammonia as studied by π^- meson capture in hydrogen, 7:58350 (JINR—R-14-81-534)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions
Investigation of time components of the ^{238}U+^{12}C and W+^{22}Ne fission reactions, 7:58706 (JINR-R—7-81-184)

Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics
Analog of the Feynman-Gell-Mann equation for a spin 1 charged particle, 7:58784 (JINR—R-2-81-403)
Anomalous dimension quark counting in higher orders of QCD, 7:58558 (JINR—R-2-81-401)
Complete set of highest-weight representation for SL(3,C), 7:58809 (JINR—E-2-81-604)
Complex-potential description of the damped harmonic oscillator. Pt. 2. The one-dimensional case, 7:58782 (JINR—E-2-81-609)
Contribution of the vacuum polarization into the abnormal electron magnetic moment and summation of the perturbation theory series, 7:58557 (JINR—R-2-81-303)
Convergence of adiabatic expansion in the three-body problem with the Coulomb interaction, 7:58349 (JINR—R-4-81-515)
Covariant three-dimensional equation for fermion-antifermion system. Part 1, 7:58555 (JINR—E-2-81-294)
Eta $\rightarrow 3\pi$ and eta $\rightarrow \pi^0\gamma\gamma$ decays in chiral theory, 7:58494 (JINR—R-2-81-217)
Extension of the Einstein space classification to N=1 supergravity, 7:58785 (JINR—R-2-81-466)
Lax representation for nonlinear evolution equations, 7:58783 (JINR—R-2-81-31)
Limiting relation in theory of three-particle scattering, 7:58581 (JINR—R-4-81-199)
Lowest order electroweak corrections to spin 1/2 fermion scattering. 2. The one-loop amplitudes, 7:58492 (JINR—E-2-81-486)
Meson structure functions and covariant wave functions of quark bound states, 7:58496 (JINR—R-2-81-481)
1/N-expansion for the anharmonic oscillator, 7:58780 (JINR—E-2-81-449)
Nuclear widths and level shifts of a $dt\mu$ mesic molecule, 7:58351 (JINR-R—4-81-255)
Proton structure functions at large transfer momenta and its description in a model with the quark-amplitude factorizability assumption, 7:58493 (JINR—E-2-81-548)
Quantum nonlocal conserved charges for supersymmetric generalized nonlinear sigma models, 7:58556 (JINR—E-2-81-499)
Radiative corrections to the $\nu N \rightarrow \nu X$ process, 7:58497 (JINR—R-2-81-552)
Scaling laws, logarithmic corrections and inner field, 7:57461 (JINR—R-17-81-400)
Symmetries, conservation laws and invariant solutions of nonlinear evolution equations, 7:58540 (JINR—R-2-81-249)
Unified model of multiple production of hadrons in various processes at high energies, 7:58500 (JINR—R-2-81-729)

Joint Task Force Seven, Washington, DC (USA)

Ablation acceleration of macroparticle in spiral magnetic fields, 7:58995 (IPPJ—518)
Amount of impurity and its behavior in the STP-2 screw pinch tokamak, 7:58869 (IPPJ—517)
Conducting liquid conveyer of plasma rings, 7:58870 (IPPJ—521)
Deflagration wave with radiative energy transport, 7:58994 (IPPJ—508)
Design and construction of a horizontally placed superconducting magnet and its cryostat for an electron beam ion source, 7:59001 (IPPJ-DT—84)
Edge cooling of hot plasma with the help of radio frequency wave, 7:58872 (IPPJ—523)
Field reversal by rotating waves, 7:58998 (IPPJ—526)
Magnetic configuration of twin tori for a new bundle divertor, 7:58997 (IPPJ—525)
Model equations for nonlinear time evolution of the dissipative trapped ion instability, 7:58867 (IPPJ—510)
Observation of lower hybrid current drive in the JIPP T-II torus, 7:58996 (IPPJ—524)
Oscillation of the trapped flux in the early phase of a reversed field theta-pinch, 7:58868 (IPPJ—516)
Overview of neutral beam injector technology developments at universities, 7:58993 (IPPJ—503)
Plasma confinement in ECH bumpy torus, 7:58871 (IPPJ—522)
Plasma heating. Various methods of supplementary heating, 7:58879 (IPPJ-DT—79)
Simulation for implosion of hollow shell target bombarded by proton beam, 7:58992 (IPPJ—502)
Study of effects of impurity ions and neutral atoms on reversed-field pinch by 2-D MHD pinch simulation, 7:58866 (IPPJ—505)
Test stand for magnetron H^- ion source at IPP-Nagoya, 7:59002 (IPPJ-T—33)
Two-centre Coulomb phaseshifts and radial functions, 7:58348 (IPPJ-AM—16)

Napier Coll. of Commerce and Technology, Edinburgh (UK). Dept. of Mechanical Engineering
Aerodynamic studies of a straight-bladed vertical-axis wind turbine, 7:56688 (PB—82-161985)

National Academy of Sciences - National Research Council, Washington, DC (USA)
Coal mining and ground-water resources in the United States. Final report, 7:56052 (PB—82-182056)
Disposal of excess spoil from coal mining and the Surface Mining Control and Reclamation Act of 1977: a study of regulatory requirements, engineering practices, and environmental protection objectives. Final report 14 May 80-13 Nov 81, 7:56042 (PB—82-183898)
Electric power from orbit: a critique of a satellite power system, 7:56556 (PB—82-161514)

National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center
Analysis of atmospheric ozone levels at commercial airplane cruise altitudes in winter and spring 1976-77. Technical paper, 7:58066 (AD-A—109921/7)
Comparative analysis of the Conceptual-design Studies of Potential Early Commercial MHD power plants (CSPEC), 7:57141 (DOE/NASA/10769—26)
Cross-linked polyvinyl alcohol films as alkaline battery separators, 7:57026 (NASA-TM—82802)
Effect of vacuum exhaust pressure on the performance of MHD ducts at high B-field, 7:57142 (NASA-TM—82750)
Fuel-economy and exhaust-emissions characteristics of diesel vehicles: test results of a prototype Chrysler Volare, 225 CID (3.7-liter) automobile, 7:57212 (DOE/NASA—2817-3)
Low NO/sub x/ heavy fuel combustor concept program. Phase I. Combustion technology generation. Final report, 7:57837 (DOE/NASA/0146—1)
Low NO/sub x/ Heavy Fuel Combustor Concept Program. Phase I. Final report, 7:57838 (DOE/NASA/0147—1)
Workshop on an assessment of gas-side fouling in fossil-fuel-exhaust environments, 7:57225 (DOE/ID/12138—1)

National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center
Magnetic clouds between 2-4 AU: Voyager observations, 7:58301 (NASA-TM—83849)

National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center
Carbon-catalyzed oxidation of SO_2 by NO_2 and air, 7:56029 (NASA-TP—2014)

National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center
Adaptation of the TH epsilon mu formalism for the analysis of the equivalence principle in the presence of the weak and electroweak interaction, 7:58506 (NASA-TM—82450)

National Bureau of Standards, Boulder, CO (USA)
Josephson a/d converter development. Annual technical report 1 May 80-30 Apr 81, 7:57750 (AD-A—110081/7)

National Bureau of Standards, Washington, DC (USA)
Certification of selected polynuclear aromatic hydrocarbons in standard reference material 1580, 'Organics in Shale Oil'. Final report, 7:56202 (PB—82-155193)
Development of an energy test method for a dedicated water-heating pump, 7:57193 (PB—82-170069)
Energy conservation in buildings: an economics guidebook for investment decisions, 7:57197 (PB—82-175266)
Nuclear data for the efficiency calibration of germanium spectrometer systems: measurements from the laboratories of the International Committee for Radionuclide Metrology alpha-, beta-, and gamma-ray spectrometry group. Final report, 7:57559 (PB—82-163882)
Strength and toughness of USSR Fe-20Cr-16Ni-6Mn-0.2N weldments at cryogenic temperatures. Final report, 7:57373 (PB—82-152687)
Thermal expansion of several materials for superconducting magnets. Final report, 7:57374 (PB—82-155169)
TI-59 program for calculating the annual energy requirements for residential heating and cooling. Volume I. Users manual, 7:57179 (DOE/NBB—0011-Vol.1)
TI-59 program for calculating the annual energy requirements for residential heating and cooling. Volume II. Program reference manual, 7:57180 (DOE/NBB—0011-Vol.2)
Weatherization retrofitting and occupant comfort. Final report, 7:57190 (PB—82-155177)
X-ray measurements and protection, 1913-1964: the role of the National Bureau of Standards and the national radiological organizations. Final report, 7:58238 (PB—82-165036)

National Bureau of Standards, Washington, DC (USA). Center for Building Technology
Residential solar data center: data resources and reports. Final report Sep 79-Sep 81, 7:56602 (PB—82-180845)

National Bureau of Standards, Washington, DC (USA). Surface Science Div.
Adsorption of H_2 isotopes on ZnO: coverage induced ir frequency shifts and adsorbate geometry. Technical report, 7:57574 (AD-A—111282/0)
Configurational effects in the adsorption of HD on ZnO. Technical report, 7:57571 (AD-A—109368/1)

National Center for Atmospheric Research, Boulder, CO (USA)
The white light solar corona--an atlas of k-coronameter synoptic charts August 1980 - September 1981. Technical note, 7:58306 (PB—82-179706)

National Center for Atmospheric Research, Boulder, CO (USA). Atmospheric Analysis and Prediction Div.
One- and two-dimensional photochemical modeling of the chemical interactions in the middle atmosphere (0-120 km), 7:58059 (PB—82-156613)

National Coal Board, Leatherhead (UK). Coal Utilization Research Lab.
Fluidised-bed combustion: combustion of run-of-mine coal in a 12-inch-diameter pressurised fluidised-bed combustor, 7:56094 (DOE/MC/14129—1208)

National Economic Research Associates, Inc., Los Angeles, CA (USA)
Electric Utility Rate Design Study: costing for ratemaking. Topic Paper 2. Rate design study, 7:57122 (EURDS—85)

National Economic Research Associates, New York (USA)
Cogeneration: making it happen, 7:57088 (CONF-820386—Summ.)

National Geophysical and Solar-Terrestrial Data Center, Boulder, CO (USA)
Solar-geophysical data number 447, November 1981. Part II (comprehensive reports). Data for May 1981, February 1980 and miscellanea, 7:58305 (PB—82-177734)
Solar-geophysical data number 446, October 1981. Part II (comprehensive reports). Data for April 1981, and miscellanea, 7:58304 (PB—82-171083)
Solar-geophysical data number 445, September 1981. Part II (comprehensive reports). Data for March 1981, January 1980, and miscellanea, 7:58303 (PB—82-153040)

National Inst. for Metallurgy, Randburg (South Africa). Analytical Chemistry Div.
Assessment of pellicular anion-exchange resins for the determination of anions by ion chromatography, 7:57558 (NIM—2132)
Disc storage of the data obtained from photographic plates in spark-source mass spectrometry, 7:57557 (NIM—2117)

National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)
Hazard evaluation and technical assistance Report No. TA76-111, U.S. Secret Service vehicle garage, Washington, DC, 7:58077 (PB—82-151432)
Hazard evaluation and technical assistance Report No. Ta 77-79, Department of Housing and Urban Development, Washington, DC, 7:58078 (PB—82-157769)
Health hazard evaluation report No. HETA-81-054-1010, Environmental Protection Agency, San Francisco, California, 7:58258 (PB—82-182536)
Mining health hazard evaluation report 78-101-100, field study of heat stress at a surface coal mine, Man, West Virginia, 7:56114 (PB—82-172933)
The development and evaluation of an electronic emission spectral index which can be related to the carcinogenic hazard of the respirable portion of coal-tar pitch volatiles. Final report 1 Jun 71-31 May 72, 7:58252 (PB—82-152216)

National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Surveillance, Hazard Evaluation and Field Studies
Health hazard evaluation report No. HHE-80-233-793, Davis Bessie Nuclear Power Station, Toledo Edison Company, United Engineers and Contractors Company (UE and C), Oak Harbor, Ohio, 7:58260 (PB—82-184649)
Health hazard evaluation report No. HHE-80-195-811, Elco Corporation, Connector Division, Huntingdon, Pennsylvania, 7:58259 (PB—82-184573)
Health hazard evaluation report No. HHE-80-032-814, Magma Copper Company, San Manuel, Arizona, 7:58090 (PB—82-184615)

National Library of Medicine, Bethesda, MD (USA). Toxicology Information Program
TOX-TIPS. Monthly reports, 7:58262 (PB—82-915000)

National Marine Fisheries Service, Seattle, WA (USA)
Barge Ocean 250 gasoline spill, 7:56168 (PB—82-176488)
Environmental assessment of the Alaskan Continental Shelf. Volume 5. Biological studies: assessment of available literature on effects of oil pollution on biota in arctic and subarctic waters. Final report 1 Jul 75-30 Sep 76, 7:56167 (PB—82-171794)

National Measurement Lab. (NBS), Washington, DC (USA)
Residential Solar Data Center: grant reports, 7:56603 (PB—82-180910)

National Museum of Natural History, Washington, DC (USA)
Marine birds of the southeastern United States and Gulf of Mexico. Part II. Anseriformes, 7:56162 (FWS/OBS—82/20)

National Oceanic and Atmospheric Administration, Ann Arbor, MI (USA)
Simulated transport of polycyclic aromatic hydrocarbons in artificial streams, 7:58157 (CONF-810488—4)

National Oceanic and Atmospheric Administration, Boulder, CO (USA)
EnvironmentAl assessment of the Alaskan continental shelf: annual reports of principal investigators for the year ending March 1980. Volume 5: hazards, 7:56164 (PB—81-225732)

National Oceanic and Atmospheric Administration, Rockville, MD (USA). Office of Marine Pollution Assessment
Environmental assessment of the Alaskan Continental Shelf: final reports of principal investigators, volume 12. Biological studies, 7:56169 (PB—82-185638)
Environmental assessment of the Alaskan Continental Shelf: final reports of principal investigators, Volume 16. Biological studies, 7:56171 (PB—82-185653)
Environmental assessment of the Alaskan Continental Shelf: final reports of principal investigators, volume 13. Biological studies, 7:56170 (PB—82-185646)

National Oceanic and Atmospheric Administration, Rockville, MD (USA). Office of Ocean Technology and Engineering
OTEC mooring system development: recent accomplishments. Technical report, 7:56576 (PB—82-156878)

National Research Council of Canada, Ottawa, Ontario
Urban traffic signal control for fuel economy. Part 2. Extension to small cars, 7:57210 (AD-A—109393/9)

National Research Council, Washington, DC (USA). Committee on Chemical Sciences
Separated isotopes: vital tools for science and medicine, 7:57579 (DOE/ER/10984—6)

Natural Environment Research Council, London (UK)
Geological reconnaissance study of the Dyfi Valley region, Gwynedd/Powys, Wales, 7:56303 (ENPU—81-1)
Geomechanical properties of rocks from the Altnabreac area, 7:58281 (ENPU—80-13)

Nauchno-Izsledovatelski Inst. po Pochvoznanie, Sofia (Bulgaria)
Mathematical model and computer programme for theoretical calculation of calibration curves of neutron soil moisture probes with highly effective counters, 7:57982 (INIS-mf—7090)

Naval Academy, Annapolis, MD
Characterization of trapping states in semiconductors. Final report 1980-1981, 7:56483 (AD-A—109701/3)
Radiation effects on transmission in optical fiber systems. Final report 1980-1981, 7:58002 (AD-A—109700/5)

Naval Facilities Engineering Command, Alexandria, VA (USA)
Heating, ventilating, air conditioning and dehumidifying systems. Final report, 7:57171 (AD-A—110410/8)

Naval Mine Engineering Facility, Yorktown, VA (USA)
Information on hydrogen evolution rates for mine batteries and selection of a hydrogen getter; Final report, 7:57748 (AD-A—109905/0)

Naval Postgraduate School, Monterey, CA (USA)
Design and validation of an apparatus for high temperature fatigue testing in an inert environment. Master's thesis, 7:57306 (AD-A—110990/9)
Design of an apparatus for the study of electrostatic effects on gas turbine fuel sprays and combustion efficiency. Master's thesis, 7:56179 (AD-A—111151/7)
Ecology and distribution of the benthic community on the monterey breakwater, monterey, california, 7:58144 (AD-A—102047)
Effect on fuel efficiency of parameter variations in the cost function for multivariable control of a turbofan engine. Master's thesis, 7:57280 (AD-A—110614/5)
Studies of the low temperature hot corrosion of uncoated superalloys, 7:57307 (AD-A—110992/5)

Naval Research Lab., Washington, DC (USA)
Anomalous resistivity of auroral field lines. Interim report, 7:58324 (AD-A—111266/3)
Atmospheric ^{222}Rn measurements at San Nicolas island during 1980, 7:58115 (AD-A—104802)
Collective effects on the operation of free electron lasers with an axial guide field. Memorandum report, 7:57789 (AD-A—111455/2)
Dynamics of a rotating proton layer along a magnetic ramp. Final report, 7:58817 (AD-A—111349/7)
Effect of fluctuating space charge fields on sideband instabilities in free electron lasers. Memorandum report, 7:57787 (AD-A—111160/8)
Electromagnetic Pulse (EMP) handbook development for the Defense Nuclear Agency (DNA). Annual report 1 Oct 80-30 Sep 81, 7:58043 (AD-A—111419/8)
Electron excitation and ionization rate coefficients for N_2, O_2, NO, N and O. Memorandum report, 7:58337 (AD-A—110988/3)
Evaluation of IAEA coordinated program steels and welds for 288 deg C radiation embrittlement resistance, 7:57368 (NUREG/CR—2487)
Fission beta particles emitted into the geomagnetosphere. Memorandum report, 7:58323 (AD-A—110228/4)
Heavy ion fragmentation at intermediate energy. Memorandum report, 7:57910 (AD-A—111451/1)

Influence of velocity shear on the Rayleigh-Taylor instability. Memorandum report, 7:58317 (AD-A—108800/4)
Ionospheric irregularity physics modelling. Memorandum report, 7:58325 (AD-A—111452/9)
Level shifts and inelastic electron scattering in dense plasmas. Memorandum report, 7:58815 (AD-A—108799/8)
Recoil distributions in some proton reactions. Memorandum report, 7:58632 (AD-A—111573/2)
Simulation of plasma double-layer structures, 7:58886 (LA-UR—82-2262)
Status of knowledge of radiation embrittlement in USA reactor pressure vessel steels, 7:57369 (NUREG/CR—2511)
Steady hydrodynamic loads due to vortex shedding from the OTEC cold water pipe. Final report, 7:56575 (AD-A—110459/5)
Surface wave statistics and spectra during high sea state conditions in the North Atlantic. Memorandum report, 7:56678 (AD-A—109832/6)
The cavity Q for ergodic eigenmodes. Memorandum report, 7:58816 (AD-A—109041/4)
The s3-4 ionospheric irregularities satellite experiment: probe detection of multi-ion component plasmas and associated effects on instability processes. Memorandum report, 7:58326 (AD-A—111456/0)
The three-dimensional non-linear theory of the free electron laser in the amplifying configuration. Memorandum report, 7:57779 (AD-A—110227/6)
Time-dependent three-dimensional simulation of the earth's magnetosphere: reconnection events. Memorandum report, 7:58320 (AD-A—109831/8)
Transverse beam dynamics in the modified betatron. Memorandum report, 7:57790 (AD-A—111682/1)
Weak and strong ignition. II. Sensitivity of the hydrogen-oxygen system. Memorandum report, 7:56442 (AD-A—108843/4)

Naval Surface Weapons Center, Dahlgren, VA (USA)
Global ocean tides. Part VIII. The semidiurnal luni-solar declination tide (K2), atlas of tidal charts and maps. Final report, 7:56677 (AD-A—110129/4)

Naval Surface Weapons Center, Silver Spring, MD (USA)
Filamentation instability of a relativistic hollow electron beam. Final report, 7:57859 (AD-A—111198/8)

Navy Personnel Research and Development Center, San Diego, CA (USA)
Energy co914639servation in Navy family housing: a 'master-metered' approach. Technical report Jul-Oct 79, 7:57167 (AD-A—109022/4)
Energy management for navy family housing: a manual for voluntary residential energy conservation. Technical report, April 1980-September 1981, 7:57172 (AD-A—110958/6)
Energy-related attitudes of Navy family housing residents. Report No. 2, Mar-May 1979, 7:57168 (AD-A—109655/1)

Netherlands Energy Research Foundation, Petten
Belt-shaped screw-pinch reactor, 7:58967 (ECN—110)
Cross-section library DOSCROS81 (in a 640 group structure of the SAND-II type), 7:58662 (ECN—111)
Evaluation of neutron cross sections for the Pd isotopes (RCN-3 data library), 7:58661 (ECN—108)

Nuclear Regulatory Commission Issuances, August 1981, 7:56886 (NUREG—0750-V14-N2)
Nuclear Regulatory Commission issuances: opinions and decisions of the Nuclear Regulatory Commission with selected orders, January 1, 1979-June 30, 1979. Volume 9, pages 1-760, 7:56896 (PB—82-180035)
Nuclear Regulatory Commission Issuances: opinions and decisions of the Nuclear Regulatory Commission with selected orders, July 1, 1979-December 31, 1979. Volume 10, pages 1-870, 7:56897 (PB—82-180043)
Nuclear Regulatory Commission Issuances, September 1981, 7:56887 (NUREG—0750-V14-N3)
Report to Congress on abnormal occurrences. Quarterly report Jan-Mar 81, 7:56967 (NUREG—0090-V4-N1)
Report to Congress on abnormal occurrences, July-September 1981. Quarterly report, 7:56968 (NUREG—0090-V4-N3)
Safety goals for nuclear power plants: a discussion paper, 7:56974 (NUREG—0880)
Standards development status summary report: data as of December 31, 1981 and January 31, 1982, 7:56881 (NUREG—0566-V2-N1)
Unresolved safety issues summary: aqua book. Report for 16 Nov 81-19 Feb 82, 7:56970 (NUREG—0606-V4-N1)
U.S. Nuclear Regulatory Commission functional organization charts, 7:56877 (NUREG—0325-REV-4)

Nuclear Regulatory Commission, Washington, DC (USA). Advisory Committee on Reactor Safeguards
Review and evaluation of the Nuclear Regulatory Commission safety research program for Fiscal Year 1983. Report to the Congress, 7:56973 (NUREG—0864)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Fuel Cycle and Material Safety
Directory of certificates of compliance for radioactive materials packages. Volume 3, revision 1. Summary report of NRC approved quality assurance programs for radioactive material packages, 7:56277 (NUREG—0383-V3-Rev.1)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Technical Information and Document Control
Nuclear Regulatory Commission issuances, 7:56891 (NUREG—0750-Vol.14-No.6)
Nuclear Regulatory Commission issuances, 7:56892 (NUREG—0750-Vol.15-No.3)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Waste Management
Environmental assessment for the Barnwell low-level waste disposal facility, 7:56377 (NUREG—0879)

Nuclear Regulatory Commission, Washington, DC (USA). Office of International and State Programs
Information report on state legislation: Volume 8, Number 3, 7:56413 (NUREG/BR—0025-82/03)

Nuclear Regulatory Commission, Washington, DC (USA). Office of Management and Program Analysis
Occupational radiation exposure at commercial nuclear power reactors, 1980. Annual report, 7:56972 (NUREG—0713-V2)
Standards development status. Summary report, 7:56880 (NUREG—0566-V1-N10)
Systematic evaluation program status summary report: November 1-30, 1981, 7:56969 (NUREG—0485-V3-N13)

Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Material Safety and Safeguards
Directory of certificates of compliance for radioactive materials packages: summary report of NRC approved packages, 7:56275 (NUREG—0383-V1-REV-1)

Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation
Bayesian analysis of diesel generator failure data. Technical report, 7:56713 (NUREG—0873)
Draft Environmental Statement related to the operation of Catawba Nuclear Station, Units 1 and 2. Docket Nos. 50-413 and 50-414, Duke Power Company, et al, 7:56945 (NUREG—0921)
Final environmental statement related to the operation of Clinton Power Station, Unit No. 1. Docket No. 50-461, 7:58186 (NUREG—0854)
Licensing requirements for pending applications for construction permits and manufacturing license, 7:56884 (NUREG—0718-Rev-2)
Nuclear Regulatory Commission staff computer programs for use with meteorological data, 7:59087 (NUREG—0917)
Staff supplement to the draft report on human engineering guide to control room evaluation: response to comments, sample checklist, draft systems review guidelines, and evaluation procedures, 7:56883 (NUREG—0659)
Standard technical specifications for Westinghouse pressurized water reactors (revision issued Fall 1981). Technical report, 7:56878 (NUREG—0452-REV-4)
Steam generator tube experience, 7:56975 (NUREG—0886)

Nuclear Regulatory Commission, Washington, DC (USA). Office of Resource Management
Summary information report, 7:56893 (NUREG—0871-Vol.1-No.3)
Systematic evaluation program. Status summary report, 7:56879 (NUREG—0485-Vol.4-No.7)

Nuclear Regulatory Commission, Washington, DC (USA). Office of State Programs
Information report on state legislation: Volume 8, Number 1, 7:56411 (NUREG/BR—0025-82/01)
Information report on state legislation: Volume 8, Number 2, 7:56412 (NUREG/BR—0025-82/02)

NUS Corp., Rockville, MD (USA)
Idaho State Briefing Book for low-level radioactive-waste management, 7:56319 (NUS—3635A)
Illinois State Briefing Book for low-level radioactive waste management, 7:56318 (NUS—3634)
Kimborough Hospital energy audit. Final report, 7:57166 (AD-A—108821/0)
Virginia State Briefing Book for low-level radioactive-waste management, 7:56317 (NUS—3624)

O

Oak Ridge Gaseous Diffusion Plant, TN (USA)
Determination of trace impurities in uranium hexafluoride using inductively coupled plasma-atomic emission spectroscopy, 7:57554 (K/TL/AT—147)
Noble gas removal and concentration by combining fluorocarbon absorption and adsorption technologies, 7:56306 (K/PS—5002)

Oak Ridge National Lab., TN (USA)
60 GHz gyrotron development program. Quarterly report No. 7, January-March 1981, 7:59018 (ORNL/Sub—79/21453/7)
Agricultural production in the United States by county: a compilation of information from the 1974 census of agriculture for use in terrestrial food-chain transport and assessment models, 7:58137 (ORNL—5768)

Analysis of elevated-temperature tensile and creep properties of normalized and tempered 2 1/4 Cr-1 Mo steel, 7:57372 (ORNL/TM—8075)
Analysis of the harmonics and power-factor effects at a utility-intertied photovoltaic system, 7:56549 (CONF-820735—2)
Analysis of the residential-energy-conservation tax credits: concepts and numerical estimates, 7:57186 (ORNL/Sub—80/13816/1)
Baseline environmental characterization of Pike County Coal-Gasification Facility site. Environmental Sciences Division publication No. 1858, 7:56044 (ORNL/TM—8035)
Coating crystalline nuclear waste forms to improve inertness, 7:56297 (CONF-810528—16)
Community-based assessment and planning of energy futures. Final report of the decentralized solar-energy technology-assessment program, 7:57100 (ORNL—5879)
Convoy electron production in heavy-ion-solid collisions, 7:58341 (CONF-810728—6)
Deposition probe measurements of impurity and plasma fluxes near the wall in ISX-B, 7:58821 (CONF-811113—45)
Desalting seawater and brackish waters: 1981 cost update, 7:56917 (ORNL/TM—8191)
Diffuse reflectance infrared Fourier-Transform spectra of selected organic compounds, 7:57691 (ORNL/TM—8321)
Distributed resource management: deadlocks, 7:59104 (ORNL/TM—8086)
Distribution energy-control-center experiment, 7:56725 (CONF-820735—1)
Energy characteristics of a two-evaporator refrigerator using a refrigerant mixture. Phase II. Project X01 7762. Final report, 7:57187 (ORNL/Sub—81-7762/2)
Enhanced ion backscattering near 180^0 scattering angles in the two-atom scattering model, 7:58355 (ORNL—5909)
Evaluation of events involving decay-heat-removal systems in nuclear power plants, 7:56750 (NUREG/CR—2799)
FECWATER: user's manual of a Finite-Element Code for simulating WATER flow through saturated-unsaturated porous media, 7:56320 (ORNL/TM—7316)
Field testing energy-saving hermetic compressors in residential refrigerators, 7:57174 (CONF-820664—9)
FORICO: gap dynamics model of the lower montane rain forest in Puerto Rico, 7:58126 (ORNL/TM—8115)
60-GHz gyrotron development program alternate frequency study, 7:59019 (ORNL/Sub—79/21453/S1)
High-temperature gas-cooled reactor safety studies for the Division of Accident Evaluation. Quarterly progress report, January 1-March 31, 1982, 7:56986 (NUREG/CR—2874-Vol.1)
Method for interpolating in Bondarenko factor tables and other functions, 7:58751 (CONF-820566—1)
Modeling of an ANFLOW municipal waste-treatment unit, 7:57835 (ORNL/MIT—342)
Near surface modification: new techniques and applications in materials science, 7:57371 (ORNL—5896)
Oak Ridge Research Reactor quarterly report, October, November, and December 1981, 7:56948 (ORNL/TM—8367)
Permeability of salt-crystal interfaces to brine, 7:58284 (ORNL—5874)
Population and decay of high-spin states in /sup 157-161/Yb: evolution of nuclear shapes as a function spin and neutron number, 7:58680 (CONF-820738—1)
Portable software package for nonlinear partial differential equations, 7:59079 (CONF-820740—1)
Publications of the Transportation Systems Utilization Division: a bibliography, 7:57214 (ORNL/EIS—198)
Recent results of dispersion experiments at emission heights of 50 and 100 m, 7:58065 (ORNL-tr—4859A)
Resource data inventory for the Oak Ridge area, 7:59089 (ORNL/TM—7941)
Screening designs for response surface experiments, 7:59088 (ORNL/CSD/TM—159)
Simulated transport of polycyclic aromatic hydrocarbons in artificial streams, 7:58157 (CONF-810488—4)
Simulation of radionuclide transport in U.S. agriculture, 7:58131 (CONF-820729—1)
Summary of biomass research programs at Oak Ridge National Laboratory, 7:56489 (CONF-820730—1)
Updated version of the DOT 4 one- and two-dimensional neutron/photon transport code, 7:56922 (ORNL—5851)
Whole-tree harvesting: first year progress report. Impacts on productivity and nutrient change, 7:56480 (ORNL/TM—7873)
Whole-tree harvesting: nutrient depletion estimates and post-harvest impacts on nutrient dynamics. Third year progress report for 1981, 7:58225 (ORNL/TM—8335)

Oak Ridge Y-12 Plant, TN (USA)
Diamond turning of steel in a carbon-saturated atmosphere, 7:57764 (Y/DX—423)
Ultrasonic determination of grain size in uranium, 7:57380 (Y/DW—361)

Oceanic Inst., Waimanalo, HI (USA)
OTEC environmental benchmark survey Kahe Point, Oahu, May 1980-May 1981. Final report, 7:58174 (DOE/NBM—2016055)

Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna
STOSS - A computer module which can be used in Monte-Carlo-calculation for determining the path of a particle in a heterogeneous medium in three dimensions, 7:58745 (SGAE—4031)

Office of Radiation Programs, Washington, DC (USA)
Considerations of environmental protection criteria for radioactive waste. Background report, 7:56322 (PB—82-185182)

Office of Technology Assessment (U.S. Congress), Washington, DC
As assessment of development and production potential of federal coal leases, 7:56115 (PB—82-149378)

Ohio State Univ., Columbus (USA). Dept. of Metallurgical Engineering
Influence of nitrogen on the sensitization, corrosion, mechanical, and microstructural properties of austenitic stainless steels. First annual progress report, 7:57319 (DOE/ER/10972—T1)

Oklahoma State Univ., Stillwater (USA). Dept. of Physics
Characterization of the optical properties of laser and phosphor crystals. Final report 15 January 1979-14 January 1982, 7:57782 (AD-A—110886/9)

Ontario Economic Council, Toronto (Canada)
Nuclear power at Ontario Hydro. A case study in technological innovation, 7:57085 (INIS-mf—7101)

Oregon Inst. of Tech., Klamath Falls (USA). Geo-Heat Center
Basin View Geothermal Heating District, Klamath Falls, Oregon: conceptual design and economic-feasibility study report, 7:56667 (DOE/ET/27256—T20)
Community heat-pump system, Klamath County, Oregon, 7:56668 (DOE/ET/27256—T21)
Feasibility study for geothermal-water space heating for the Safford Federal Prison Camp, Safford, Arizona, 7:56670 (DOE/ET/27256—T34)
Feasibility study of geothermal heating, Modoc Lassen housing project, 7:56666 (DOE/ET/27256—T10)
Geothermal potential for heating and cooling facilities, San Bernardino Valley College, San Bernardino, California, 7:56669 (DOE/ET/27256—T32)

ORI, Inc., Silver Spring, MD (USA)
Evaluation and abatement of noise from aircraft auxiliary power units and airport ground power units. Technical report (final), 7:58271 (PB—82-168360)

Osaka Univ., Suita (Japan). Faculty of Engineering
Power-system transient-stability analysis: a Hamiltonian approach, 7:56724 (CONF-820549—2)

Osaka Univ., Suita (Japan). Inst. of Laser Engineering
Computational study on light ion beam fusion, 7:58986 (ILE—8002P)
Computer simulation of nonlinear propagation characteristics of CO_2 laser pulse, 7:58984 (ILE—7907P)
Effects of thermal conduction and compressibility on Rayleigh-Taylor instability, 7:58987 (ILE—8004P)
Investigation of implosion symmetry and stability by time-resolved x-ray shadowgraphy, 7:58989 (ILE—8012P)
Ion beam generation on Reiden III, 7:58988 (ILE—8005P)
Modified Thomson parabola ion spectrometer of wide dynamic range, 7:58864 (ILE—8011P)
Neutronics in pellets of inertial confinement fusion, 7:58990 (ILE—8016P)
Recent thin foil target experiments on Reiden III, 7:58985 (ILE—7914P)
Saturation mechanism and improvement of conversion efficiency of free electron laser, 7:57791 (ILE—8015P)
Self-generated magnetic field in CO_2 laser produced plasma, 7:58983 (ILE—7902P)
Studies on implosion efficiency in LIB driven implosion, 7:58991 (ILE—8018P)

Otawa (Toru), Muncie, IN (USA)

Development of a slide program describing a site-selection process for small wind-energy-conversion systems (SWECS). Final technical report, 7:56686 (DOE/R5/10301—1-Final)

Oxford Univ. (UK). Chemical Crystallography Lab.

Magnetic ordering in oxide solid solutions. Final scientific report 1 Sep 79-31 Aug 81, 7:57572 (AD-A—110138/5)

Oxford Univ. (UK). Nuclear Physics Lab.

Experimental tests of gauge theories: lectures presented at the CERN-JINR joint school of physics, Hanko, Finland, 6-19 June 1981, 7:58569 (PB—82-177619)

On the transverse momentum distribution of quarks created in a flux tube, 7:58510 (PB—82-178468)

P

Pacific Northwest Lab., Richland, WA (USA)

A method for determining allowable residual contamination levels of radionuclide mixtures in soil, 7:56414 (PNL—3852)

Analysis of the effects of integrating wind turbines into a conventional utility: a case study. Final report, 7:56682 (PNL—3962)

Candidate wind-turbine-generator site: annual data summary, January 1981-December 1981, 7:56689 (PNL—4283)

Characterization methods for ultrasonic test systems, 7:58011 (NUREG/CR—2264)

Decision making model for the recovery of useful material resources from wastes, 7:56327 (PNL-SA—10310)

Evaluation of catch-per-unit-effort indices used in aquatic monitoring programs at nuclear-power-plant sites, 7:58160 (NUREG/CR—1598)

Evaluation of solar-air-heating central-receiver concepts, 7:56571 (PNL—4003)

Feasibility of incinerating and vitrifying organic resins in a single step, 7:56325 (PNL-SA—10269)

Improved manufacturing techniques for rf and laser hardening of missile domes. Phase I. Technical report, 7:57828 (PNL—4335)

Krypton-85 storage in sputter-deposited amorphous metals, 7:56329 (PNL-SA—10536)

Measurements of ^{234}U, ^{238}U and ^{230}Th in excreta of uranium-mill crushermen, 7:58236 (NUREG/CR—2503)

Microbial colonization of retorted shale in field and laboratory studies, 7:58216 (PNL—4311)

PNL sections of draft WISPE report, 7:58060 (PNL-SA—8633)

PNL technical review of pressurized thermal-shock issues, 7:56985 (NUREG/CR—2837)

Preliminary investigation of a technique to separate fission noble metals from fission-product mixtures, 7:56267 (PNL—4116)

Radiation effects in curium-doped $Gd_2Ti_2O_7$ and $CaZrTi_2O_7$, 7:57499 (PNL-SA—10004)

Radon and aerosol release from open-pit uranium mining, 7:56384 (NUREG/CR—2407)

Relevance of biotic pathways to the long-term regulation of nuclear waste disposal. A report on Tasks 1 and 2 of Phase I, 7:56385 (NUREG/CR—2675-Vol.1)

Solubility limits of metal ions and mechanism of leaching nuclear-waste glasses, 7:56326 (PNL-SA—10303)

State-of-practice review of ultrasonic in-service inspection of Class I system piping in commercial nuclear power plants, 7:56749 (NUREG/CR—2468)

System for remote monitoring of changes in aquatic habitat resulting from water-level fluctuations, 7:58173 (PNL-SA—9978)

Understanding radioactive waste, 7:57087 (PNL—3570)

Waste glasses: requirements and characteristics, 7:56328 (PNL-SA—10365)

Waste vitrification: a historical perspective, 7:56324 (PNL-SA—10261)

Wet storage of spent fuel, 7:56281 (PNL-SA—10385-A)

Workshop on environmental assessment, 7:58166 (NUREG/CP—0025)

Paris-6 Univ., 75 (France)

Production of events with two or three muons in the final state during the interaction on nucleons of neutrinos and anti-neutrinos of the CERN narrow band beam with a maximum energy of 200 GeV, 7:58417 (FRNC-TH—1061)

Paris-11 Univ., 91 - Orsay (France)

Cations redistribution in mixed oxides $(U,Ce)O_2$ and $(U,Pu)O_2$ under thermal gradient, 7:56257 (CEA-R—5139)

Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire

Fixed J spectral distribution in large shell model spaces. II. Fixed J configuration centroids and widths, 7:58692 (IPNO-TH—81-5)

Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire

Ideal MHD stability of oblate spheromaks and β optimization, 7:58887 (LRP—176/80)

PEDCo Environmental, Inc., Durham, NC (USA)

Determination of an empirically derived IP/TSP relationship. Final report Aug 80-Feb 81, 7:58092 (PB—82-190554)

Pennsylvania State Univ., University Park (USA)

Importance of active sites for char gasification in oxygen (air) and carbon dioxide. Annual report Oct 80-Sep 81, 7:56009 (PB—82-180621)

Interactive mine-power-system analysis. User's manual: Volume II. Open file report, 28 September 1979-28 January 1980, 7:56070 (PB—82-138306)

Interactive mine-power-system analysis: Volume I. Open file report, 28 September 1979-30 November 1980, 7:56069 (PB—82-138298)

Pennsylvania State Univ., University Park (USA). Dept. of Geosciences

Delineation of acid mine drainage potential of coal-bearing strata of the Pottsville and Allegheny Groups in western Pennsylvania. Technical completion report, 7:56045 (PB—82-157876)

Perkin-Elmer Corp., Pomona, CA (USA). Aerospace Div.

Techniques suitable for a portable wear metal analyzer. Final report Oct 80-Apr 81, 7:56428 (AD-A—111352/1)

Petro-Lewis Corp., Bakersfield, CA (USA)

Field demonstration of the conventional steam drive process with ancillary materials. Second annual report, October 1980-October 1981, 7:56146 (DOE/SF/10762—2)

Philips Labs., Briarcliff Manor, NY (USA)

Design study of small efficient cryocoolers. Final technical report 14 Apr-11 Sep 80, 7:57749 (AD-A—109908/4)

Development of a novel laser material for miniaturized laser systems. Quarterly technical report No. 4, 1 Jul-30 Sep 81, 7:57778 (AD-A—109129/7)

Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Elektrizitaet

Wide-band E/H field sensing probes: A discussion of probe interactions and coupling problems, 7:58012 (PTB-E—19)

Pittsburgh Univ., PA (USA). Dept. of Chemistry

Laser desorption mass spectrometry. II. Applications to structural analysis. Technical report, 7:57539 (AD-A—110822/4)

Politech Corp., Austin, TX (USA)

Iowa State Briefing Book for low-level radioactive waste management, 7:56299 (DOE/NBM—2020717)

Polytechnic Inst. of New York, Brooklyn (USA)

Hydropower utilization in New York State, 7:56469 (NYSERDA—80-10)

Portland Cement Association, Skokie, IL (USA). Buildings Div.

Constructing earth sheltered housing with concrete, 7:57199 (PB—82-175902)

Portland Cement Association, Skokie, IL (USA). Construction Technology Labs.

Shear transfer in large scale reinforced concrete containment elements. Report No. 2. Technical report, 7:56981 (NUREG/CR—2450)

Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)

Calculation code TRANPES for transitional Purex process, 7:56265 (PNCT—841-80-71)

SPIDER: a computer code for superposition of Gaussian plume for the intermittent and time-dependent atmospheric release of radioactivity, 7:56323 (PNCT—841-81-01)

Transuranium elements partition calculation code Advanced MIXSET for Purex process, 7:56266 (PNCT—841-81-35)

Princeton Univ., NJ (USA). Dept. of Mechanical and Aerospace Engineering

Fundamental and semi-global kinetic mechanisms of hydrocarbon combustion. Annual report, 1 July 1981-30 June 1982, 7:56446 (DOE/PC/40283—T1)

Princeton Univ., NJ (USA). Plasma Physics Lab.
Hyperbolic-secant mode coupling, 7:59021 (PPPL—1923)
Identification of magnetic dipole lines above 2000 A in several Mo and Zr ions on the PLT tokamak, 7:58888 (PPPL—1899)
Optimum shapes for pump limiters, 7:59020 (PPPL—1901)
Plasma transport in stochastic magnetic fields. III. Kinetics of test-particle diffusion, 7:58889 (PPPL—1915)

Propellants Explosives and Rocket Motor Establishment, Waltham Abbey (UK)
Weathering of plastics materials in the tropics. 6. The further evaluation of a solar radiation concentrating device (EMMA) as a means of accelerating the weathering of plastics, 7:57463 (AD-A—109385/5)

Public Technology, Inc., Washington, DC (USA)
Traffic performance measurement. Information bulletin, 7:57216 (PB—82-153065)
Transportation system management, air quality, and energy conservation. Information bulletin, 7:57217 (PB—82-154105)

Purdue Univ., Lafayette, IN (USA). Dept. of Chemistry
Heat capacity of water at extremes of supercooling and superheating. Technical report, 7:57575 (AD-A—111394/3)

Purdue Univ., Lafayette, IN (USA). School of Electrical Engineering
Annual report on high-intensity solar cells, 7:56523 (SAND—82-7122)

R

Radian Corp., Austin, TX (USA)
Effects of process-water selection on lime-limestone flue-gas desulfurization chemistry. Final report, 7:56038 (EPRI-CS—2451)
Permit requirements for development of energy and other selected natural resources for the State of Arkansas, 7:57102 (USGS-OFR—81-1251)
Permit requirements for development of energy and other selected natural resources for the State of Missouri, 7:57105 (USGS-OFR—81-1265)

RAND Corp., Santa Monica, CA (USA)
Energy situation and the world of Californians, 7:57091 (AD-A—110536/0)
The development of high-intensity negative ion sources and beams in the USSR. Technical report, 7:58958 (AD-A—108935/8)

R and D Associates, Santa Monica, CA (USA)
Some analytic models for quasi-static source region EMP: application to nuclear lightning. Topical report, 5 January-1 November 1980, 7:57822 (AD-A—109644/5)

Rationalisierungs-Kuratorium der Deutschen Wirtschaft e.V., Eschborn (Germany, F.R.)
Analysis of the amount of energy and material used in the packing of liquid food and luxury food. Volume I: introduction, program and objectives of the project, 7:57243 (PB—82-158601)
Analysis of the amount of energy and material used in the packing of liquid food and luxury food. Volume 5: inquiry of consumer attitudes concerning packings and their potential recycling, 7:57245 (PB—82-158643)

RCA Labs., Princeton, NJ (USA)
Effects of radiation on oxide materials. Final report 26 Sep 77-25 Sep 78, 7:57472 (AD-A—111149/1)

Regensburg Univ. (Germany, F.R.). Naturwissenschaftliche Fakultaet 4 - Chemie und Pharmazie
Chlorine isotope effects in ion exchange reactions with a strongly basic anion exchanger, 7:57590 (INIS-mf—7185)

Rensselaer Polytechnic Inst., Troy, NY (USA)
Ceramic materials for fusion reactors. Final report, 7:58969 (EPRI-AP—2515)

Republic Geothermal, Inc., Santa Fe Springs, CA (USA)
Induced fractures: well stimulation through fracturing, 7:56654 (LA-UR—82-1971)

Research Inst. of National Defence, Stockholm (Sweden)
Influence of stone walls on the explosion propagation of an air hydrogen mixture in an enclosed space, 7:56443 (FOA-C—20408-D1)

Research Triangle Inst., Durham, NC (USA)
Ventilation surge techniques. Volume I. Final report Sep 80-Dec 81, 7:57747 (AD-A—109079/4)

Risoe National Lab., Roskilde (Denmark)
Corrosion aspects of high-level waste disposal in salt domes, 7:56333 (RISO-I—63)

Rochester Univ., NY (USA)
Inelastic scattering of high energy muons from nuclear targets, 7:58440

Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group
Acoustic-emission monitoring of steam turbines. Final report, 7:56706 (EPRI-CS—2367)

Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant
Photochemical reactions in plutonium-nitric acid solutions, 7:57723 (RFP—3113)

Rockwell International Corp., Richland, WA (USA). Energy Systems Group
Preliminary assessment of the rate of deformation in the Pasco Basin, south-central Washington, 7:56331 (RHO-BWI-SA—133)

Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations
Environmental surveillance. Annual report for calendar year 1980, 7:58119 (RHO-LD—163)
Geochemical behavior of supercalcine waste form: its stability in a basalt environment, 7:56330 (RHO-BWI-C—105)
Preliminary evaluation of water-resource development and potential within the Pasco Basin, 7:58180 (RHO-BWI-LD—33)
Technique for determining radionuclide distribution coefficients at field moisture contents, 7:56332 (RHO-LD—175)

Rockwell International Corp., Thousand Oaks, CA (USA)
Efficiency-improvement study for GaAs solar cells. Final report, March 31, 1980-September 30, 1981, 7:56522 (SAND—82-7105)

Rockwell International Corp., Thousand Oaks, CA (USA). Science Center
Acoustic-emission monitoring of steam turbines. Final report, 7:56706 (EPRI-CS—2367)

Rogers, Golden and Halpern, Inc., Philadelphia, PA (USA)
Outer Continental Shelf oil and gas information program. Outer Continental Shelf and onshore oil and gas activities and impacts in the Arctic: a summary report. Update 1, May 1982, 7:56119 (USGS-OFR—82-19)

Rondout Associates, Inc., Stone Ridge, NY (USA)
The use of intermediate and long period seismic waves for discrimination and yield determination. Annual Report No. 2, 1 Oct 80-30 Sep 81, 7:58053 (AD-A—110184/9)

Royal Inst. of Tech., Stockholm (Sweden). Plasma Physics and Fusion Research
Confinement and related transport in Extrap geometry, 7:58895 (TRITA-PFU—81-05)

S

Sandia Corp., Albuquerque, NM (USA)
Underwater pressure measurements in the lagoon, 7:58030 (AD—341048/7)

Sandia Labs., Albuquerque, NM (USA)
Radiation effects in pigtailed GaAs and GaAlAs LEDs. Final report, 12 Feb 79-30 Sep 80, 7:58004 (AD-A—111047/7)

Sandia National Labs., Albuquerque, NM (USA)
Aeroelastic stability analysis of a Darrieus wind turbine, 7:56693 (SAND—82-0672)
Aging with respect to flammability and other properties in fire-retarded ethylene propylene rubber and chlorosulfonated polyethylene, 7:57745 (NUREG/CR—2314)
Analysis of small commercial photovoltaic applications, 7:56565 (SAND—81-7172)
Annual report on high-intensity solar cells, 7:56523 (SAND—82-7122)
Bibliography of geology of Southeastern New Mexico, 7:58274 (SAND—82-0770)
Comparison of reentry-vehicle dynamic models for the estimation of nonsymmetrical aerodynamic coefficients, 7:57816 (SAND—82-0666C)

Comparison of TiH/sub x/- and ZrH/sub x/-$KClO_4$ pyrotechnics, 7:58028 (SAND—82-0198C)
Computer simulations of 75-mm projectiles impacting sand targets, 7:58026 (SAND—82-0831)
Computer use in the high-temperature mechanical/metallurgy testing laboratory, 7:57370 (NUREG/CR—2794)
Contact stresses on a thin plate after large displacements to a full parabolic surface, 7:56611 (SAND—81-2083)
Design method for the flow field and drag of bodies of revolution in incompressible flow, 7:57815 (SAND—82-0526C)
Development of the MC3344 Fluorinert/Mylar energy storage capacitor, 7:57829 (SAND—80-2764)
Dynamic behavior of a class of photovoltaic converters, 7:56566 (SAND—82-7075C)
Efficiency-improvement study for GaAs solar cells. Final report, March 31, 1980-September 30, 1981, 7:56522 (SAND—82-7105)
Electrical conductivity of rigid polyurethane foam at high temperature, 7:57469 (SAND—82-1259)
Electron energy and charge albedos - calorimetric measurement vs Monte Carlo theory, 7:58744 (SAND—80-1968)
Feasibility of imaging unstained DNA by field-ion tomography, 7:58192 (SAND—82-1831C)
Filter characterization, 7:57830 (SAND—81-2489)
Identifying electrical loads which can use direct photovoltaic dc power, 7:56557 (SAND—80-7012)
Intermediate photovoltaic system application experiment operational performance report. Volume 8 for Lovington Square Shopping Center, Lovington, NM, 7:56559 (SAND—81-7085/8)
Intermediate photovoltaic system application experiment operational performance report. Volume 3 for Beverly High School, Beverly, MA, 7:56562 (SAND—81-7088/3)
Intermediate photovoltaic system application experiment operational performance. Volume 6 for Lovington Square Shopping Center, Lovington, NM. Executive summary, 7:56564 (SAND—81-7099/6)
2.2-kilowatt photovoltaic concentrator array, 7:56520 (SAND—81-7009)
Program to predict performance of a gas gun, 7:57761 (SAND—81-2546)
Radiation and propagation of short acoustical pulses from underground explosions, 7:58045 (SAND—82-0754)
Results of testing a development module of the second-generation E-Systems concentrating photovoltaic-thermal module, 7:56521 (SAND—82-0701)
Risk methodology for geologic disposal of radioactive waste: model description and user manual for Pathways model, 7:56378 (NUREG/CR—1636-Vol.1)
Risk methodology for geologic disposal of radioactive waste: sensitivity analysis of the environmental transport model, 7:56379 (NUREG/CR—1636-Vol.2)
Risk methodology for geologic disposal of radioactive waste: asymptotic properties of the environmental transport model, 7:56380 (NUREG/CR—1636-Vol.3)
RUNNOS and RUNDEP: computer programs for calculating loads on earth penetrators, 7:57842 (SAND—82-0963)
Soft-error susceptibility of a CMOS RAM: dependence upon power-supply voltage, 7:58005 (SAND—81-2140)
Solar hemispherical reflectometer modification for second-surface mirror measurement, 7:56612 (SAND—82-0934)
Solar-thermal-industry status and future needs, 7:56478 (SAND—82-8030)
Starting step size for an ODE solver, 7:59090 (SAND—80-1734)
Summary report of the study of single medium thermocline thermal-energy storage, 7:57017 (SAND—82-1833C)
Test results of early photovoltaic concentrating collectors, 7:56518 (SAND—81-1406)
Thick boride coatings by chemical vapor deposition, 7:57456 (SAND—81-2454C)
Use of nuclear instrument modules (NIM) for lead and arsenic counting systems, 7:57991 (SAND—82-1495)

Sandia National Labs., Livermore, CA (USA)
Designing the manifold piping for parabolic-trough-collector fields, 7:56572 (SAND—81-1780)
Molten-nitrate-salt technology development. Progress report, 7:56573 (SAND—82-8220)
Solidification and solid state transformations of austenitic stainless steel welds, 7:57378 (SAND—82-8703)

Savannah River Ecology Lab., Aiken, SC (USA)
Simulated transport of polycyclic aromatic hydrocarbons in artificial streams, 7:58157 (CONF-810488—4)

Science and Engineering Research Council, Chilton (UK). Rutherford Appleton Lab.
Antireflecting sublayers for neutron thin film polarising mirrors, 7:58750 (PB—82-157587)
Hyperfine splittings of bag model gluonia, 7:58537 (PB—82-161555)
Jets and tests of qcd in e+ e- experiments, 7:58446 (PB—82-157561)
The MIT bag can accommodate the θ(1640) and I(1440) as glueballs, 7:58580 (PB—82-161563)

Science Applications, Inc., Chatsworth, CA (USA). Combustion Science and Advanced Technology Dept.
Spray combustion of synthetic fuels, Phase II - spray-combustion phenomena. Third quarterly report, 1 April 1982-30 June 1982, 7:56098 (DOE/PC/40276—3)

Science Applications, Inc., Idaho Falls, ID (USA)
Alaska State Briefing Book for low-level radioactive waste management, 7:56334 (SAI—774-AK)
Hawaii State briefing book for low-level radioactive waste management, 7:56335 (SAI—774-HI)

Science Applications, Inc., La Jolla, CA (USA)
Calculation of the neutron and gamma-ray environment in and around the AFRRI TRIGA reactor. Volume II. Final report, 5 May-31 December 1980, 7:56946 (AD-A—109727/8)
Compact reversed-field pinch reactor (CRFPR): a high-density approach to magnetic fusion energy, 7:59013 (LA-UR—82-2148)
Energy efficiency improvement of residential and commercial gas appliances, Phase II. Final report Dec 79-Jun 81, 7:57192 (PB—82-169681)
System analysis of shallow land burial. Volume 3: appendix. Technical report, 26 September 1979-23 January 1981, 7:56313 (NUREG/CR—1963-V3)
System analysis of shallow land burial. Volume 3: appendix. Technical report 26 Sep 79-23 Jan 81, 7:56314 (NUREG/CR—1963-V3)
System analysis of shallow land burial. Volume 1: code manual. Technical report 26 Sep 79-23 Jan 81, 7:56381 (NUREG/CR—1963-V1)
System analysis of shallow land burial. Volume 1: code manual. Technical report, 26 September 1979-23 January 1981, 7:56312 (NUREG/CR—1963-V1)
System analysis of shallow land burial. Volume 2: technical background. Technical report, 26 November 1979-23 January 1981, 7:56382 (NUREG/CR—1963-V2)
System analysis of shallow land burial. Volume 2: technical background. Technical report 26 Sep 79-23 Jan 81, 7:56383 (NUREG/CR—1963-V2)

Science Applications, Inc., McLean, VA (USA)
Fluid dynamics-reactive flow modeling. Final report, 7:57743 (AD-A—109947/2)
Geophysical plasmas and atmospheric modeling. Final report, 7:58056 (AD-A—111632/6)

Science Research Council, Chilton (UK). Rutherford and Appleton Labs.
Hyperfine splittings of bag model gluonia, 7:58512 (RL—81-086)
Jets and tests of QCD in $e^+ e^-$ experiments, 7:58571 (RL—81-087)
MIT bag can accommodate the theta (1640) and i(1440) as glueballs, 7:58513 (RL—81-090)

Scientific Service, Inc., Redwood City, CA (USA)
Testing of shelter design and industrial hardening concepts at the Mill Race event. Final report, 7:57752 (AD-A—110919/8)

Scottsdale, City of, AZ (USA)
City of Scottsdale Courts Building solar space-conditioning project. Final technical report, 7:56587 (DOE/CS/32166—T1)

Scripps Institution of Oceanography, La Jolla, CA (USA)
Radioactivity of open-sea plankton samples, 7:58129 (AD—465307/7)

Secord (Nelson W.), Brighton, MI (USA)
WECS-Load controlled pitch-variable load conversion to heat, 7:56687 (DOE/R5/10309—1)

Sierra Club, San Francisco, CA (USA)
Proceedings of the action seminar on acid precipitation, 7:58122 (CONF-791163—)

Sierra Geophysics, Inc., Redmond, WA (USA)
Relative waveform inversion. Semi-annual technical report 1 Nov 1979-30 Apr 1980, 7:58052 (AD-A—110183/1)

Simpson Weather Associates, Charlottesville, VA (USA)
- Feasibility study of a solar-and-wind-powered desalinization device (SOWIDE). Final report, 7:56589 (DOE/ET/23112—1)

Skoda, Plzen (Czechoslovakia)
- Programmable: logic equipment for ultrasound periodic inspections of reactor pressure vessels, 7:56751 (ZJE—247)

Skoda, Plzen (Czechoslovakia). Zavodni Pobocka Ceske Vedeckotechnicke Spolecnosti
- Steels and alloys for nuclear power: proceedings of symposium, 7:56927 (INIS-mf—7093)

Skoda, Plzen (Czechoslovakia). Zavod Vystavba Jadernych Elektraren
- Activation method for determining neutron spectra and fluences, 7:57997 (ZJE—235)

Societe des Forges et Ateliers du Creusot, 58 - Imphy (France). Centre de Recherches des Acieries
- Optimization of steels susceptible to the action of hydrogen. Final report, 7:57321 (EUR—6887-FR)

Solarelectronics, Inc., Bellingham, MA (USA)
- Flat-plate solar array project. Task I. Silicon material: investigation of the hydrochlorination of $SiCL_4$. Quarterly report, April 9, 1982-July 8, 1982, 7:56495 (DOE/JPL/956061—4)

Solar Energy Research Inst., Golden, CO (USA)
- Boundary-layer mesoscale wind analysis, 7:56681 (SERI/TR—215-1612)
- Direct normal solar radiation data manual: long-term, monthly mean, daily totals for 235 National Weather Service Stations. Addendum to the Insolation Data Manual, 7:56472 (SERI/SP—281-1658)
- Imaging radiometry systems, 7:56473 (SERI/TP—215-1636)
- Industrial biomass market assessment: a subcontract report, 7:56526 (SERI/TR—19451-1)
- Investigation of mechanically hard, chemically inert antireflection coatings for photovoltaic solar modules. Final technical report, April 1, 1980-March 31, 1981, 7:56524 (SERI/TR—9010-3-T1)
- Investigations of the tornado wind energy system, 7:56695 (SERI/TR—11052-1)
- Photochemical degradation of polymeric coatings on mirrors as studied in situ using FT-IR reflection-absorbance spectroscopy, 7:56613 (SERI/TP—255-1408)
- Standards application and development plan for solar thermal technologies, 7:56479 (DE—81-030310)
- Structure and electronic studies of defects in amorphous silicon. Final report, May 1981-April 1982, 7:56525 (SERI/TR—9079-1-T7)
- Technical and economical assessment on tethered wind-energy systems (TWES), 7:56694 (SERI/TR—09172-2)
- Wind-energy program: FY 1982 third quarterly review, 7:56679 (SERI/PR—211-1672)

Solarex Corp., Rockville, MD (USA)
- Design of mobile photovoltaic power systems: 0.5-3 kW. Final report, 7:56548 (AD-A—108889/7)

Solar, San Diego, CA (USA)
- Erosion mechanisms of metals. Annual report 1 Oct 80-30 Sep 81, 7:57309 (AD-A—111537/7)
- Evaluation of cast titanium alloy compressor components. Volume I. Final report May 76-Aug 78, 7:57308 (AD-A—111431/3)

South Carolina Dept. of Health and Environmental Control, Columbia (USA). Bureau of Radiological Health
- Transportation of radioactive material in South Carolina, October 1980-September 1981, 7:56279 (NUREG/CR—2842)

South Carolina Wildlife and Marine Resources Dept., Charleston (USA). Marine Resources Research Inst.
- South Atlantic OCS area living marine resources study. Volume I: an investigation of live bottom habitats south of Cape Fear, North Carolina. Final report, 7:58177 (PB—82-160102)
- South Atlantic OCS area living marine resources study. Volume II: an investigation of live bottom habitats north of Cape Fear, North Carolina. Final report, 7:58178 (PB—82-160110)
- South Atlantic OCS area living marine resources study: executive summary. Final report, 7:58150 (PB—82-160094)

Southern California Edison Co., Rosemead (USA)
- Cool water coal gasification program. First annual progress report. Interim report, 7:56703 (EPRI-AP—2487)

Southern Research Inst., Birmingham, AL (USA)
- Development of methods for the determination of elemental phosphorus and phosphine in air. Final report, 7:58082 (PB—82-166331)

Southern Science Applications, Inc., Dunedin, FL (USA)
- Background and derivation of ANS-5.4 standard fission product release model. Technical report, 7:56983 (NUREG/CR—2507)

Southern Solar Energy Center, Atlanta, GA (USA)

- Georgia State Briefing Book for low-level radioactive waste management, 7:56301 (DOE/NBM—2020720)

Southwest Research Inst., San Antonio, TX (USA)
- Ecological investigations of petroleum production platforms in the central Gulf of Mexico: volume I, part 6 and 7. Final report 1978, 7:56166 (PB—82-167800)
- Ecological investigations of petroleum production platforms in the central Gulf of Mexico: volume II. Final report 1978, 7:56148 (PB—82-167826)
- Emission characterization of an alcohol/diesel-pilot fueled compression-ignition engine and its heavy-duty diesel counterpart. Final report, August 1980-August 1981, 7:57297 (PB—82-154113)
- Methodology for estimating emissions from off-highway mobile sources for the RAPS program. Final report March-September 1974, 7:58086 (PB—82-169913)
- Nonstandard aging tests on coal-derived distillate fuels. Technical progress report, 7 January 1982-6 July 1982, 7:56028 (DOE/PC/41755—13)
- Steam turbine disc cracking experience. Volume 2. Data summaries and discussion. Final report, 7:56745 (EPRI-NP—2429-Vol.2)
- Study and modeling of high-temperature fatigue-crack propagation in austenitic stainless steel. Progress report for 1982, 7:57317 (DOE/ER/10475—3)
- Value assessment aid to complex decision making. Final report, 7:56742 (EPRI-NP—2507)

Southwest Research Inst., San Antonio, TX (USA). Army Fuels and Lubricants Research Lab.
- An overview of Army Mobility Energy Research and Development. Interim report Jun 79-Oct 81, 7:57090 (AD-A—109182/6)

Sperry Research Center, Sudbury, MA (USA)
- Niobium nitride Josephson devices with semiconductor barriers. Final report 27 May 80-25 Sep 81, 7:57751 (AD-A—110128/6)

SRI International, Arlington, VA (USA). Strategic Studies Center
- The planning and management of energy-related research and development in the U.S.S.R.: science policy working group joint U.S.-U.S.S.R. science and technology exchange program. Final report, 7:57082 (PB—82-169731)

SRI International, Menlo Park, CA (USA)
- Analysis of nuclear propagation effects utilizing wideband satellite data. Final report, 14 January 1980-30 January 1981, 7:58318 (AD-A—109683/3)
- Equatorial plasma bubbles: vertically elongated wedges from the bottomside F layer. Technical report, 7:58319 (AD-A—109685/8)
- Laboratory investigation of containment in underground nuclear tests. Final report, 17 December 1979-15 February 1981, 7:58039 (AD-A—109717/9)
- Occupational health assessment of the geothermal hydrothermal convection industry. Final report, 7:56642 (PB—82-162595)
- Places TV-track, ionosonde, and magnetometer operations. Final report, 1 April 1980-31 January 1981, 7:58038 (AD-A—109690/8)
- Stratospheric reactions of peroxynitric acid. Final report, 29 September 1978-31 December 1980, 7:58070 (AD-A—110835/6)
- Transport of low specific activity radioactive materials. Final report, 7:56278 (NUREG/CR—2440)

Stanford Research Inst., Menlo Park, CA (USA)
- Air pressure measurements, 7:58032 (AD—362095/2)

Stanford Univ., CA (USA). Center for Materials Research

Electrolytic deposition of low-cost, high-purity polysilicon suitable for use in solar-cell devices. Final technical report, 7:56491 (DOE/ER/70067—T1)

Stanford Univ., CA (USA). Guidance and Control Lab.

Closed loop control of automotive engines. Final report Feb 1978-Jun 1980, 7:57281 (PB—82-164088)

Stanford Univ., CA (USA). School of Medicine

Primer on theory and operation of linear accelerators in radiation therapy. Final report, 7:57916 (PB—82-162306)

Starrett City, Brooklyn, NY (USA)

Energy-Exchange Project, 7:57266 (DOE/CS/20468—T1-Vol.1)

Energy-Exchange Project, 7:57267 (DOE/CS/20468—T1-Vol.2)

Starrett City Housing Corp., New York (USA)

Energy-Exchange Project, 7:57266 (DOE/CS/20468—T1-Vol.1)

Energy-Exchange Project, 7:57267 (DOE/CS/20468—T1-Vol.2)

Statens Raad foer Byggnadsforskning, Stockholm (Sweden)

Energy saving effects in dwellings where measures have been implemented by governmental energy saving grants, 7:57203 (PB—82-161472)

State Univ. of New York, Stony Brook (USA). Dept. of Earth and Space Sciences

Thermally induced chemical migration in carbonate rocks. Final project report, 7:58283 (DOE/ER/10412—T1)

STEAG A.G., Essen (Germany, F.R.)

Construction and operation of a prototype RESOX plant in conjunction with Bergbau-Forschung FGD system. Final report, 7:56039 (EPRI-CS—2467)

Stichting Energieonderzoek Centrum Nederland, Petten

Coal as an industrial fuel, 7:56108 (ESC—9)

Energy saving, how is it possible. A social-psychological study of the promotion of energy saving through behavior influence in family households, 7:57202 (ECN-ESC—5-SAM)

Stichting voor Fundamenteel Onderzoek der Materie, Jutphaas (Netherlands). Inst. voor Plasma-Fysica

Equilibrium studies of skin-like pressure and current-density profiles, 7:58890 (Rijnhuizen—81-134)

Influence of impurities on the discharge behaviour in SPICA, 7:58891 (Rijnhuizen—81-135)

Space- and time-resolved measurements of ion energy distributions by neutral beam injection in TORTUR II, 7:58893 (Rijnhuizen—81-137)

Time-of-flight analysis of charge-exchange neutral particles from the TORTUR II plasma, 7:58892 (Rijnhuizen—81-136)

Stirling Thermal Motors, Inc., Ann Arbor, MI (USA)

Evaluation of the potential of the Stirling engine for heavy duty application. Final report, 7:57846 (NASA-CR—165473)

Stockholm Univ. (Sweden)

Inadequacy of one dimensional ocean models for the global carbon cycle, 7:58156 (CM—51)

Stockholm Univ. (Sweden). Fysiska Institutionen

Temperature gradient effects on the neutral gas penetration into a magnetized plasma, 7:59022 (TRITA-PFU—82-02)

PERSONAL AUTHOR INDEX

Authors' surnames are indexed in the form appearing in the abstracted publication; given names are reduced to initials. Each author entry gives the publication title and the citation number. Report numbers, if applicable, are given in parentheses at the end of the entry. For publications with multiple authors, an author entry is provided for each. Entries for the second and succeeding authors give references to the first author.

Because of problems involved in the mechanical preparation of this index, all accent marks are omitted. Changes in spelling introduced as a result of accent omission follow standard conventions.

SUBJECT INDEX

The subject index is based on the use of subject descriptors selected from a controlled thesaurus of terms. Subject descriptors and qualifiers (subheadings) are selected and presented in the following format:

SUBJECT DESCRIPTOR
Qualifier
Title, (supplementary information), citation number, (report number)

The title may be supplemented with additional words, or a phrase, if it appears additional information would be helpful. In cases for which the title contains little or no information related to the subject entry, it may be replaced entirely by the supplementary information. A qualifier is not always required, and in such cases the title will follow the unqualified subject descriptor.

The descriptors selected for use as subject terms are generally the names of specific materials, things, or processes. To the extent possible, a qualifier is selected to describe the properties of, or processes applied to, the subject term.

Index entries are selected to indicate the important ideas and concepts presented in a document, rather than words that may appear in the text. Within the available thesaurus terms, the most probable or logical place to look for typical information is selected. "See references" are included to guide users from synonymous terms or phrases to the descriptor selected as a subject heading for the concept. (e.g. Pipeline Quality Gas see HIGH BTU GAS). "See also references" are used to indicate where to find references to subject concepts that are narrower, broader, or related to a particular subject heading. To complete an exhaustive search of a given subject, all such headings should be reviewed.

Superconducting Magnets
Correction magnet packages for the energy saver, 7:57960
Four quadrant magnet power supply for superconducting and conventional accelerator applications, 7:57928
Magnetization characterization study for the energy saver/doubler dipoles, 7:57935
Magnetostatic design of 85kg superconducting dipoles, 7:57963
Microprocessor based function generator for superconducting dipole correction coils, 7:57926
Progress in superconducting magnet technology for accelerators/storage rings, 7:57857
Uses
Intense pulsed neutron sources, 7:57955
Particle beam fusion accelerator-I (PBFA-I), 7:57850
Relevance of accelerator/storage ring technological developments to U.S. science and technology - past, present and future, 7:57854
Vacuum Systems
Vacuum control subsystem for the Fermilab Tevatron, 7:57925
ACES
See QUARKS

ACETATES
Rotational States
Preparation of a bent crystal and its use in neutron scattering, 7:58739 (INIS-mf—7108)
ACETONE
Chemical Reaction Yield
Reaction of isopropyl(pentaaquo)chromium(III) ion with molecular oxygen in aqueous solution: kinetics of the chain reaction and effects of chain-breaking reagents and of variable ionic strength, 7:57696
ACID CARBONATES
Activation Energy
Chemical kinetic studies on dry sorbents. Final report (Sodium bicarbonate), 7:56034 (DOE/FC/10184—1)
Chemical Reaction Kinetics
Chemical kinetic studies on dry sorbents. Final report (Sodium bicarbonate), 7:56034 (DOE/FC/10184—1)
ACID ELECTROLYTE FUEL CELLS
Catalyst Supports
Carbon supports for phosphoric acid fuel cell electrocatalysts: alternative materials and methods of evaluation, 7:57162
ACID MINE DRAINAGE
Regional Analysis
Delineation of acid mine drainage potential of coal-bearing strata of the Pottsville and Allegheny Groups in western Pennsylvania. Technical completion report, 7:56045 (PB—82-157876)
ACID RAIN
Environmental Effects
Acidic precipitation: considerations for an air quality standard, 7:58128
Mathematical Models
Acidification of rain in the presence of SO2, H2O2, O3, and HNO3, 7:58083 (PB—82-167206)
Meetings
Proceedings of the action seminar on acid precipitation, 7:58122 (CONF-791163—)
Seasonal Variations
Trajectory analysis of MAP3S precipitation chemistry data at Ithaca, N.Y, 7:58103
ACIDS (INORGANIC)
See INORGANIC ACIDS
ACOUSTIC MEASUREMENTS
Acoustic measurement of penetration of liquid sodium into limestone concrete, 7:57004
ACRALDEHYDE
See ACROLEIN
ACRIDINES
Infrared Spectra
Diffuse reflectance infrared Fourier-Transform spectra of selected organic compounds, 7:57691 (ORNL/TM—8321)
ACROLEIC ACID
See ACRYLIC ACID
ACROLEIN
Biological Effects
Acrolein health effects. Final report, 7:58254 (PB—82-161282)
ACRYLIC ACID
Chemical Radiation Effects
Novel diaphragm for electrolytic cells. Final report (Gamma radiation), 7:57711 (PB—82-168006)
ACRYLIC ALDEHYDE
See ACROLEIN
ACRYLIC POLYMERS
See POLYACRYLATES
ACTINIDES
Chemical Reactions
Environmental biogeochemistry of chelating agents and recommendations for the disposal of chelated radioactive wastes, 7:56369
Thermochromatography
Problems of chemical identification of new synthetic elements, 7:57717 (INIS-SU—86)
ACTIVATED SLUDGE PROCESS
Feasibility Studies
Technical and economic comparison of air and oxygen in activated sludge wastewater treatment, 7:55988 (DOE/OR/03054—6)
Performance Testing
Wastewater characterization and treatability studies, 7:56037 (DOE/OR/03054—6)
ACTIVITY COEFFICIENT
See REACTION KINETICS
ACTIVITY LEVELS
Transport analysis of short-lived fission products in sodium coolant (LMFBR), 7:56849
ADIABATIC COMPRESSION HEATING
Compressional heating, 7:58843 (EUR—6584(Vol.1))
Plasma heating. Various methods of supplementary heating, 7:58879 (IPPJ-DT—79)
ADONE
(1.2-GeV electron--positron storage ring at Frascati.)
Data Acquisition Systems
Status of the acquisition system for the x-ray channel of the Wiggler Adone facility, 7:57981 (INFN/TC—81/12)
Radiation Protection
Status of the acquisition system for the x-ray channel of the Wiggler Adone facility, 7:57981 (INFN/TC—81/12)
ADSORBENTS
New class of sorbents for recovery of heavy metals in analysis of objects of non-ferrous metallurgy, 7:57547 (INIS-SU—86)
AEGEAN SEA
Insolation
Phytoplankton ecology of the Saronicos Gulf, Aegean Sea. Data report - Year 1981, Part 1: hydrography, 7:58147 (DEMO—82/1)
Temperature Distribution
Phytoplankton ecology of the Saronicos Gulf, Aegean Sea. Data report - Year 1981, Part 1: hydrography, 7:58147 (DEMO—82/1)
Water Chemistry
Phytoplankton ecology of the Saronicos Gulf, Aegean Sea. Data report - Year 1981, Part 1: hydrography, 7:58147 (DEMO—82/1)
AERODYNAMICS
Mathematical Models
Comparison of reentry-vehicle dynamic models for the estimation of nonsymmetrical aerodynamic coefficients, 7:57816 (SAND—82-0666C)
AEROSOLS
See also RADIOACTIVE AEROSOLS
Lithium aerosol formation in relation to fusion reactors, 7:56867
Nucleation
Long-range attraction in the collisions of free-molecular and transition-regions aerosol particles, 7:58339 (BNL—31561)
Particle Size
Investigation of accident-generated aerosols: releases from free fall spills, 7:58096
Washout
Theoretical estimates of the scavenging coefficient for soluble aerosol particles as a function of precipitation type, rate and altitude, 7:58106
AEROSPACE INDUSTRY
Materials
Critical metals conservation, recycling and substitution, 7:57224 (CONF-8109156—)
Resource Conservation
Critical metals conservation, recycling and substitution, 7:57224 (CONF-8109156—)
AFRRI REACTOR
Gamma Spectra
Calculation of the neutron and gamma-ray environment in and around the AFRRI TRIGA reactor. Volume II. Final report, 5 May-31 December 1980, 7:56946 (AD-A—109727/8)
Neutron Spectra
Calculation of the neutron and gamma-ray environment in and around the AFRRI TRIGA reactor. Volume II. Final report, 5 May-31 December 1980, 7:56946 (AD-A—109727/8)

AGGLOMERATING ASH PROCESS
Pilot Plants
Operation of the ash-agglomerating gasifier. July 1976-December 1977 and April 1979-July 1980, final report, 7:55979 (DOE/ET/10237—1)
AGRICULTURAL RESIDUES
See AGRICULTURAL WASTES
AGRICULTURAL WASTES
See also MANURES
Enzymatic Hydrolysis
Raw materials evaluation and process development studies for conversion of biomass to sugars and ethanol, 7:56457
Gasification
Energy recovery by gasification of agricultural and forestry wastes in a co-current moving bed reactor, 7:56510 (EUR—7594-EN)
Waste Processing
Unit process models for potential subsystems of energy-agro-waste complexes, 7:57258
Waste Product Utilization
United packing: Alcohol feasibility study. Final report, 7:56455 (PB—82-178476)
AGRICULTURE
See also FARMS
Energy Analysis
Energy for agriculture in Pakistan, 7:57060
Forecasting
Energy for agriculture in Pakistan, 7:57060
AIR CLEANING SYSTEMS
Design
Development and testing of a prototype device to provide air meeting the Occupational Safety and Health Act of 1970. Final report, 7:57845 (PB—82-166521)
AIR CONDITIONERS
See also SOLAR AIR CONDITIONERS
Coefficient of Performance
Directory of room air conditioners which comply with November 3, 1979 standards, 7:57188 (P—400-00-016)
Directories
Directory of room air conditioners which comply with November 3, 1979 standards, 7:57188 (P—400-00-016)
Energy Efficiency
Life-cycle cost analysis of major appliances, 7:57201
Life-Cycle Cost
Life-cycle cost analysis of major appliances, 7:57201
Manufacturers
Directory of room air conditioners which comply with November 3, 1979 standards, 7:57188 (P—400-00-016)
Operating Cost
Economic analysis of air-conditioning systems with off-peak chilled-water storage. Master's thesis, 7:57169 (AD-A—109876/3)
Performance
A review of aircraft cabin conditioning for operations in Australia, 7:57209 (AD-A—109044/8)
Specifications
A review of aircraft cabin conditioning for operations in Australia, 7:57209 (AD-A—109044/8)
Thermal Efficiency
Directory of room air conditioners which comply with November 3, 1979 standards, 7:57188 (P—400-00-016)
AIR FLOW
Mathematical Models
Nonstationary nocturnal drainage flow model, 7:58064
Nocturnal Variations
Nonstationary nocturnal drainage flow model, 7:58064
AIR POLLUTION

STATIONARY POLLUTANT SOURCES
Atmospheric Chemistry
The MAP3S/RAINE precipitation chemistry network: statistical overview for the period 1976-1980, 7:58105
Trajectory analysis of MAP3S precipitation chemistry data at Ithaca, N.Y, 7:58103
Biological Indicators
Forest tree growth as a bioindicator of pollution abatement systems at the Radford Army Ammunition Plant. Final report 1 Jul 76-30 Jun 78, 7:58246 (AD-A—110802/6)
Chemical Composition
Development of methods for the determination of elemental phosphorus and phosphine in air. Final report, 7:58082 (PB—82-166331)
Environmental Transport
National research and development program: environmental air. Summary. Final report, 1975-1978, 7:58113
Gas Analysis
Complete testing of the NIOSH method for the determination of trace metals by atomic absorption spectrophotometry, 7:58084 (PB—82-167743)
Geographical Variations
The MAP3S/RAINE precipitation chemistry network: statistical overview for the period 1976-1980, 7:58105
Monitoring
Radon and aerosol release from open-pit uranium mining, 7:56384 (NUREG/CR—2407)
Seasonal Variations
The MAP3S/RAINE precipitation chemistry network: statistical overview for the period 1976-1980, 7:58105
Washout
Variation in chemical wet deposition with meteorological conditions, 7:58104
AIR POLLUTION ABATEMENT
Environmental Impacts
Forest tree growth as a bioindicator of pollution abatement systems at the Radford Army Ammunition Plant. Final report 1 Jul 76-30 Jun 78, 7:58246 (AD-A—110802/6)
AIR POLLUTION CONTROL
Economic Analysis
Study of the cost effectiveness of stationary source, mobile source and transportation controls to improve air quality. Final report Sep 79-Nov 81, 7:58085 (PB—82-167750)
Economic Impact
National research and development program: environmental air. Summary. Final report, 1975-1978, 7:58113
Economics
The development of high expansion foam systems for the suppression of respirable coal dust. Final report, 7:56072 (PB—82-151333)
Standards
Economic impact of implementing volatile organic compound Group II regulations in Ohio. Final report Jun-Dec 81, 7:58181 (PB—82-154261)
AIR POLLUTION MONITORS
Efficiency
Determination of theoretical sampling efficiencies for aspirated particulate matter through the DRES large-volume sampler, 7:58067 (AD-A—109922/5)
Performance
Dependence of nephelometer scattering coefficients on relative humidity: fronts, nocturnal disturbance, and wood smoke, 7:58091 (PB—82-188913)
Ozone measurements to 48km with chemiluminescent ozone detectors. Annual progress report, 7:58068 (AD-A—110342/3)
Size selective samplers for particulate monitoring in California. Final report, 7:58079 (PB—82-158312)
Spectrometers
Breadboard gas filter correlation spectrometer for atmospheric measurement of hydrazines and nitrogen dioxide. Final report Jan 77-Apr 79, 7:58069 (AD-A—110688/9)
AIR QUALITY
Pro and con: visibility protection, 7:58123
Monitoring
Ambient air quality monitoring plan, Johnsonville Steam Plant, 7:56053 (TVA/ONR/ARP—82/13)
National air quality, monitoring, and emissions trends report, 1977. Annual report, 7:58081 (PB—82-166133)
Recommendations
Review of the National Ambient Air Quality Standards for Particulate Matter: assessment of scientific and technical information. Staff paper (final), 7:58088 (PB—82-177874)
AIR SAMPLERS
Performance
A simple automatic variable flow controller, 7:58095

Collection of radon with solid oxidizing reagents, 7:58120
AIRCRAFT
See also SPACE SHUTTLES
Air Conditioning
A review of aircraft cabin conditioning for operations in Australia, 7:57209 (AD-A—109044/8)
Nickel-Zinc Batteries
Nickel-zinc batteries for RPV applications. Interim technical report, 15 December 1979-15 November 1980 (Remotely Piloted Vehicles), 7:57023 (AD-A—111087/3)
AIRPORTS
Noise Pollution Abatement
Evaluation and abatement of noise from aircraft auxiliary power units and airport ground power units. Technical report (final), 7:58271 (PB—82-168360)
ALABAMA
Coal Industry
Economic-impact study of the expanding coal-mining industry in Tuscaloosa County, Alabama, 7:56110 (NP—2903933)
Energy Policy
Marketable energy resources in Alabama: a partially annotated research bibliography, 7:57093 (NP—2906080)
Energy Sources
Marketable energy resources in Alabama: a partially annotated research bibliography, 7:57093 (NP—2906080)
Radioactive Waste Management
Alabama State Briefing Book for low-level radioactive waste management, 7:56298 (DOE/NBM—2020712)
Transport Regulations
Information report on state legislation: Volume 8, Number 3, 7:56413 (NUREG/BR—0025-82/03)
ALAP

Charged-Particle Transport
Electron energy and charge albedos - calorimetric measurement vs Monte Carlo theory, 7:58744 (SAND—80-1968)
Experiments concerning electron capture and loss to the continuum and convoy electron production by highly ionized projectiles in the 0.7—8.5-MeV/u range traversing the rare gases, polycrystalline solids, and axial channels in gold, 7:58746
Diffusion
Diffusion of ion implanted aluminum in silicon carbide, 7:57457
Grain-boundary segregation in aluminum-doped silicon carbide, 7:57422 (DOE/ER/02390—T2)
Electron Collisions
Electron energy and charge albedos - calorimetric measurement vs Monte Carlo theory, 7:58744 (SAND—80-1968)
Electron Emission
Convoy electron production in heavy-ion-solid collisions, 7:58341 (CONF-810728—6)
Extrusion
Evaluation of polymers as lubricants in the extrusion of aluminum, 7:57410
Ion Collisions
Convoy electron production in heavy-ion-solid collisions, 7:58341 (CONF-810728—6)
Phonons
Ab initio calculation of phonon frequencies of Al, 7:57392
Production
Technical and economic possibilities for waste heat utilization in aluminium production, 7:57226 (EUR—7387-DE)
Wave Propagation
Shock compression measurements at 1 to 7 TPa, 7:57387
ALUMINIUM 26
Nucleosynthesis
^{26}Al/sup g,m/ production cross sections from the ^{23}Na(α,n)^{26}Al reaction, 7:58634 (DOE/ER/40048—14L2)
ALUMINIUM 27 TARGET
Alpha Reactions
Recoil distance lifetime measurements in ^{30}Si using a particle-gamma technique, 7:58636 (INIS-mf—7116)
Oxygen 16 Reactions
Study of ^{16}O-induced deep inelastic nuclear reactions on ^{27}Al, ^{48}Ti, and ^{58}Ni by spectroscopy of the gamma radiation from the reaction products, 7:58641 (INIS-mf—7181)
Photonuclear Reactions
A-dependence of cumulative photoprotons, 7:58663 (EFI—471(14)-81)
ALUMINIUM ALLOYS
Cracking
Environmental cracking of the alpha-beta titanium alloy, Ti-6Al-6V-2Sn, 7:57418
Erosion
Erosion mechanisms of metals. Annual report 1 Oct 80-30 Sep 81, 7:57309 (AD-A—111537/7)
Mechanical Properties
Evaluation of cast titanium alloy compressor components. Volume I. Final report May 76-Aug 78 (Ti-6Al-4V), 7:57308 (AD-A—111431/3)
Microstructure
Influence of alloy microstructure on Al_2O_3-peg morphologies in CoCrAl alloys and coatings, 7:57367 (LBL—14668)
Physical Radiation Effects
Development and irradiaton performance of uranium aluminide fuels in test reactors, 7:56952
ALUMINIUM ARSENIDES
Band Theory
Bound and resonant surface states at the (110) surfaces of AlSb, AlAs, and AlP, 7:57521
Surface Properties
Bound and resonant surface states at the (110) surfaces of AlSb, AlAs, and AlP, 7:57521
Traps
Characterization of trapping states in semiconductors. Final report 1980-1981, 7:56483 (AD-A—109701/3)
ALUMINIUM COMPOUNDS
Additives for alkaline recovery of heavy oil, 7:56122 (CONF-820712—)
Band Theory
Bound and resonant surface states at the (110) surfaces of AlSb, AlAs, and AlP, 7:57521
Magnetization
Suppression of spin fluctuations in UAl_2 in high magnetic fields, 7:57384
Magnetoresistance
Suppression of spin fluctuations in UAl_2 in high magnetic fields, 7:57384
Surface Properties
Bound and resonant surface states at the (110) surfaces of AlSb, AlAs, and AlP, 7:57521
ALUMINIUM OXIDES
Performance of sodium-beta alumina solid electrolyte in Na/S cells, 7:57047
Crystal Structure
Sintering of polycrystalline ionic conductors: β''-Al_2O_3 and NASICON, 7:57421 (CONF-790682—8)
Mechanical Properties
Special-purpose materials for magnetically confined fusion reactors. Third annual progress report, 7:58964 (DOE/ER—0113)
Microstructure
Influence of alloy microstructure on Al_2O_3-peg morphologies in CoCrAl alloys and coatings, 7:57367 (LBL—14668)
Moessbauer Effect
Coordination of iron in alumino glasses containing some alkaline or alkaline earth elements, 7:57437 (INIS-mf—7059-Vol.2)
Phase Diagrams
Chemical stability of barium calcium aluminate dispenser-cathode impregnants, 7:57576 (ATR—82-8424-1)
Isomorphism in quaternary mutual systems, $MeAl_2O_4$, $MeGa_2O_4$ long $2SiO_2$, $2GeO_2$ (Me = Ca, Sr, Ba), 7:57654 (INIS-SU—99)
Physical Properties
Sintering of polycrystalline ionic conductors: β''-Al_2O_3 and NASICON, 7:57421 (CONF-790682—8)

ALUMINIUM PHOSPHIDES
Band Theory
Bound and resonant surface states at the (110) surfaces of AlSb, AlAs, and AlP, 7:57521
Surface Properties
Bound and resonant surface states at the (110) surfaces of AlSb, AlAs, and AlP, 7:57521
AMERICIUM
Alpha Spectroscopy
Methods used at CNEN for the analysis of Pu and ^{241}Am in marine samples, 7:57569
Solvent Extraction
Extraction of Am(III) and Eu(III) from aqueous ammonium thiocyanate by dihexyl-N,N-diethylcarbamolymethylphosphonate and related compounds, 7:57566
AMERICIUM 241
Adsorption
Americium interaction with calcite and aragonite surfaces in seawater, 7:58170
Geochemistry
Americium interaction with calcite and aragonite surfaces in seawater, 7:58170
AMERICIUM 242 TARGET
Neutron Reactions
Optical and statistical model calculation of the americium 242m capture cross section, 7:58700 (CEA-CONF—5967)
AMERICIUM COMPOUNDS
Chemical State
Peculiarities of behavior of americium and neptunium ions in the strongly complexing medium ($K_{10}P_2W_{17}O_{61}$), 7:57719 (INIS-SU—86)
AMERICIUM SELENIDES
Crystal Structure
Chevrel phases, actinide based compounds $An(1+x)Mo_6Se_8$ (An=Np, Pu, Am), 7:57475 (CEA-CONF—5916)
Magnetic Properties
Chevrel phases, actinide based compounds $An(1+x)Mo_6Se_8$ (An=Np, Pu, Am), 7:57475 (CEA-CONF—5916)
AMES TEST
See MUTAGEN SCREENING
AMINES
See also ANILINE
HYDROXYLAMINE
Chemical Analysis
Synchronous detection of laser-induced fluorescence, 7:57555 (LA-UR—82-1929)
Fluorescence
Synchronous detection of laser-induced fluorescence, 7:57555 (LA-UR—82-1929)
Infrared Spectra
Diffuse reflectance infrared Fourier-Transform spectra of selected organic compounds, 7:57691 (ORNL/TM—8321)
Liquid Column Chromatography
Heteroatom speciation in coal liquefaction via FT-IR coupled with liquid chromatography. Quarterly progress report, January 1, 1982-March 31, 1982, 7:55999 (DOE/PC/40799—T2)
AMINO ACIDS
See also DTPA
EDTA
NTA
Hot Atom Chemistry
γn-recoil produced compounds, 7:57740 (INIS-mf—7117)
Labelling
γn-recoil produced compounds, 7:57740 (INIS-mf—7117)
Radiolysis
Studies on spin-trapped radicals in γ-irradiated aqueous solutions of L-alanylglycine and L-alanyl-L-alanine by high-performance liquid chromatography and ESR spectroscopy, 7:57710
AMINOBENZENE
See ANILINE
AMINOGLYCIDES
See AMINES
SACCHARIDES
AMMONIA
Chemical Bonds
Temperature breaking of hydrogen bonds in ammonia as studied by πp meson capture in hydrogen, 7:58350 (JINR—R-14-81-534)
Chemical Reactions
Reactions of sulfur dioxide with excess ammonia, 7:57684
Electron-Molecule Collisions
Design of experiments to assess gas-composition effects on electron-beam ionization, 7:57843 (CONF-820256—1)
AMMONIUM COMPOUNDS
Atmospheric Chemistry
Wet deposition variability as observed by MAP3S, 7:58102
Chemical Properties
New trends in phosphate chemistry: phosphate-tellurates and phospho-chromates, 7:57657 (INIS-SU—111)
AMNION
See FETAL MEMBRANES
AMORPHOUS STATE
Meetings
Proceedings of the international conference on amorphous systems investigated by nuclear methods, 7:57299 (INIS-mf—7059-Vol.2)
ANAEROBIC DIGESTION
Comparative Evaluations
Biogas technology in Denmark. Comparison of anaerobic digester designs, 7:56448 (STUB—4)
Demonstration Plants
Biogas demonstration plants. Designing, construction and operation of 3 industrial-scale systems, 7:56449 (STUB—6)
Biogas technology in Denmark. Comparison of anaerobic digester designs, 7:56448 (STUB—4)
ANALOG COMPUTERS
Calibration
Quadrature-error-correction techniques for the HP8542A ANA, 7:58006 (BDX—613-2658R)
Data Covariances
Quadrature-error-correction techniques for the HP8542A ANA, 7:58006 (BDX—613-2658R)
ANALOG-TO-DIGITAL CONVERTERS
Design
Josephson a/d converter development. Annual technical report 1 May 80-30 Apr 81, 7:57750 (AD-A—110081/7)
Josephson Junctions
Josephson a/d converter development. Annual technical report 1 May 80-30 Apr 81, 7:57750 (AD-A—110081/7)
ANEMIAS
Genetic Variability
Inborn anemias in mice. Comprehensive progress report, 1 August 1979-1 June 1982, to accompany twenty-seventh renewal proposal, 7:58220 (DOE/EV/03264—21)
ANESTHETICS
See also PROCAINE
Biological Effects
Cytogenetic evaluation of bone marrow cells in the rat following long term inhalation exposure to nitrous oxide plus halothane. Final report, 7:58256 (PB—82-164849)
ANHARMONIC OSCILLATORS
Excited States
1/N-expansion for the anharmonic oscillator, 7:58780 (JINR—E-2-81-449)
Ground States
1/N-expansion for the anharmonic oscillator, 7:58780 (JINR—E-2-81-449)
ANILINE
Infrared Spectra
Diffuse reflectance infrared Fourier-Transform spectra of selected organic compounds, 7:57691 (ORNL/TM—8321)
ANIMAL CELLS
See also TUMOR CELLS
Raman Spectra
Laser-Raman spectrum of a Davydov soliton, 7:58201
ANIMAL FEEDS
Data Compilation
Agricultural production in the United States by county: a compilation of information from the 1974 census of

agriculture for use in terrestrial food-chain transport and assessment models, 7:58137 (ORNL—5768)

ANIONS
Ion Sources
Electron energy recovery system for negative ion sources (Patent), 7:58389

ANL
(Argonne National Laboratory.)
Superconducting Magnets
Argonne National Laboratory superconducting pulsed coil program, 7:59062

ANTARCTIC REGIONS
Climates
30000 yr climatic record. Main results deduced from oxygen 18 and deuterium profiles from the Dome C ice core (Antarctica), 7:58146 (CEA-CONF—5877)

ANTARES FACILITY
Laser Targets
LOTS analysis of optical diffraction in Antares, 7:59072
Power Amplifiers
LOTS analysis of optical diffraction in Antares, 7:59072
Windows
Polytran NaCl windows for LASL Antares CO_2 Laser System, 7:59071

ANTENNAS
ICR Heating
Antennas of ion cyclotron heating installed in the TFR Tokamak. General characteristics, and coupling properties, 7:58982 (EUR-CEA-FC—1115)
Images
Imaging antenna array at 119 μm, 7:58017
Response Functions
Network loading of thin-wire antennas and scatterers in the time domain, 7:58797

ANTHRACENE
Environmental Transport
Simulated transport of polycyclic aromatic hydrocarbons in artificial streams, 7:58157 (CONF-810488—4)
Infrared Spectra
Diffuse reflectance infrared Fourier-Transform spectra of selected organic compounds, 7:57691 (ORNL/TM—8321)

ANTICONVULSANTS
Teratogenesis
Embryo culture in teratological surveillance and serum proteins in development. Progress report, 1981-1982, 7:58248 (DOE/EV/03139—46)

ANTIFERROMAGNETIC MATERIALS
Neutron Diffraction
Neutron-scattering study of Cs_2CoCl_4: a system of 1D, S = 1/2 XY antiferromagnetic chains with spin frustration, 7:57474 (BNL—31682)

ANTIMONY 134
Beta Decay
Influence of the M1 tensor term for transitions between levels of the two-proton nucleus ^{134}Te populated in the beta decay of 10-s ^{134}Sb, 7:58676

ANTIMONY COMPOUNDS
Chemical Preparation
Preparation and properties of ternary rare earth chalcopnictides, 7:57591 (INIS-SU—86)
Physical Properties
Preparation and properties of ternary rare earth chalcopnictides, 7:57591 (INIS-SU—86)

ANTIMUONS
See MUONS PLUS

ANTINEUTRINO-ELECTRON INTERACTIONS
Cross Sections
Neutrino oscillations and ν-e and anti-ν-e scattering, 7:58475 (INIS-mf—7116)

ANTINEUTRINO-NUCLEON INTERACTIONS
Inclusive Interactions
Quark jets from antineutrino interactions. 2. Inclusive particle spectra and multiplicities in the quark jets, 7:58423 (IFVE-ONF—81-94)
Muon Pairs
Production of events with two or three muons in the final state during the interaction on nucleons of neutrinos and antineutrinos of the CERN narrow band beam with a maximum energy of 200 GeV, 7:58417 (FRNC-TH—1061)

ANTIPROTON BEAMS
Beam Optics
Pulsed high current optics for antiproton production at 5.4 GeV/c, 7:57897
Beam Production
Antiproton collection from a production target, 7:57942
Beam Transport
Modular transport design for final antiproton source to precooler, 7:57899
Electron Cooling
Electron cooling for the Fermilab antiproton source, 7:57891

ANTIPROTON REACTIONS
Annihilation
Mechanisms of forward-backward spectator asymmetry in low-energy anti pD annihilation, 7:58489 (ITEP—96(1981))

ANTIPROTON-DEUTERON INTERACTIONS
Annihilation
Anti-proton annihilations in deuterium, 7:58478 (INIS-mf—7116)

ANTIPROTONS
Nuclear Reaction Yield
Measurement of "subthreshold" production of K^- and antiprotons in relativistic nuclear collisions, 7:58642
Particle Production
120-GeV superbooster for Fermilab, 7:57951

ANTS

WATER HEATERS
Energy Consumption
Conditional demand approach to appliance-usage estimates for single-family homes in the Pacific Northwest, 7:57178 (DOE/BP—128)
Energy Demand
Conditional demand approach to appliance-usage estimates for single-family homes in the Pacific Northwest, 7:57178 (DOE/BP—128)

AQUATIC ECOSYSTEMS
Baseline Ecology
OTEC environmental benchmark survey Kahe Point, Oahu, May 1980-May 1981. Final report, 7:58174 (DOE/NBM—2016055)
Depth
System for remote monitoring of changes in aquatic habitat resulting from water-level fluctuations, 7:58173 (PNL-SA—9978)
Evaluation
South Atlantic OCS area living marine resources study: executive summary. Final report, 7:58150 (PB—82-160094)
South Atlantic OCS area living marine resources study. Volume I: an investigation of live bottom habitats south of Cape Fear, North Carolina. Final report, 7:58177 (PB—82-160102)
South Atlantic OCS area living marine resources study. Volume II: an investigation of live bottom habitats north of Cape Fear, North Carolina. Final report, 7:58178 (PB—82-160110)
Invertebrates
Environmental assessment of the Alaskan continental shelf. Volume 4. Biological studies: distribution and abundance of some epibenthic invertebrates of the northeastern Gulf of Alaska with notes on the feeding biology of selected species. Final report, 7:58151 (PB—82-171760)

Maximum Acceptable Contamination
Acidic precipitation: considerations for an air quality standard, 7:58128
Statistical Models
Comparison of sensitivity analysis and error analysis based on a stream ecosystem model, 7:58153
Temperature Measurement
System for remote monitoring of changes in aquatic habitat resulting from water-level fluctuations, 7:58173 (PNL-SA—9978)
AQUATIC ORGANISMS
(Unspecified biota characteristic of aquatic ecosystems.)

MOLLUSCS
PLANKTON
Ecology
Effect of increasing CO_2 on ocean biota. Volume II, Part 5. Environmental and societal consequences of a possible CO_2-induced climate change, 7:58148 (DOE/EV/10019—2-Vol.2)
AQUIFERS
Compressed Air Energy Storage
Aquifer field test for compressed air energy storage, 7:57012
Compressed air energy storage in an aquifer, 7:57011
Contamination
Water-quality monitoring at the Hoe Creek test site: review and preliminary conclusions, 7:58162 (UCRL—87650)
Sensible Heat Storage
Confined aquifer thermal energy storage: Mobile Doublet Experiment, 7:57020
ARCHAEOLOGICAL SPECIMENS
Age Estimation
Dating of obsidian artifacts by depth-profiling of artificially hydrated surface layers, 7:58275
Ion Spectroscopy
Dating of obsidian artifacts by depth-profiling of artificially hydrated surface layers, 7:58275
Mass Spectroscopy
Dating of obsidian artifacts by depth-profiling of artificially hydrated surface layers, 7:58275
Nuclear Reaction Analysis
Dating of obsidian artifacts by depth-profiling of artificially hydrated surface layers, 7:58275
ARCHAEOLOGY
Reviews
Amorphous and microcrystalline materials in archaeology, 7:57484 (INIS-mf—7059-Vol.2)
ARGON
Atom-Molecule Collisions
Influence of vibrational and translational energies on energy transfer in Ar+HCl (J = 0, 2, 6, and 12), 7:58370
Test of the linear sum rule for vibrational energy transfer by trajectory calculations, 7:58358
Vibrational and rotational energy transfer in Ar + HF, 7:58392
Charged-Particle Transport
Experiments concerning electron capture and loss to the continuum and convoy electron production by highly ionized projectiles in the 0.7—8.5-MeV/u range traversing the rare gases, polycrystalline solids, and axial channels in gold, 7:58746
Diffusion
Mechanism of gas permeation through polymer membranes. Part I. Pure gases. Comprehensive progress report, 7:57688 (DOE/ER/05015—4-Pt.1)
Ion-Atom Collisions
Experiments concerning electron capture and loss to the continuum and convoy electron production by highly ionized projectiles in the 0.7—8.5-MeV/u range traversing the rare gases, polycrystalline solids, and axial channels in gold, 7:58746
Molecule-Molecule Collisions
Trimer formation, atom exchange, and dissociation in argon dimer collisions, 7:58369
Solubility
Mechanism of gas permeation through polymer membranes. Part I. Pure gases. Comprehensive progress report, 7:57688 (DOE/ER/05015—4-Pt.1)
ARGON 36 TARGET
Deuteron Reactions
Production of polarized deuterons and study of the tensor potential in the elastic deuteron scattering, 7:58600 (INIS-mf—7146)
ARGON IONS
Spectra
X-ray line broadening as a diagnostic in laser-produced plasmas, 7:58825 (DOE/DP/40016—T4)
ARGON ISOTOPES
Isotope Effects
Isotope effects in the solution of gases in liquids. Progress report, July 1, 1981-July 30, 1982, 7:57578 (DOE/ER/05031—4)
ARGONNE NATIONAL LABORATORY

Fuel-economy and exhaust-emissions characteristics of diesel vehicles: test results of a prototype Chrysler Volare, 225 CID (3.7-liter) automobile, 7:57212 (DOE/NASA—2817-3)
Exhaust Gases
Fuel-economy and exhaust-emissions characteristics of diesel vehicles: test results of a prototype Chrysler Volare, 225 CID (3.7-liter) automobile, 7:57212 (DOE/NASA—2817-3)
Fuel Consumption
Evaluation of the Greer fuel pre-heater under Section 511 of the Motor Vehicle Information and Cost Savings Act. Technical report, 7:57282 (PB—82-168949)
Urban traffic signal control for fuel economy. Part 2. Extension to small cars, 7:57210 (AD-A—109393/9)
Fuel Economy
Fuel-economy and exhaust-emissions characteristics of diesel vehicles: test results of a prototype Chrysler Volare, 225 CID (3.7-liter) automobile, 7:57212 (DOE/NASA—2817-3)
Fuel Substitution
Assessment of current and projected future trends in light-duty-vehicle fuel switching. Subtask 1 report, 7:57296 (DOE/PE/70045—T3)
Internal Combustion Engines
Closed loop control of automotive engines. Final report Feb 1978-Jun 1980, 7:57281 (PB—82-164088)
Traffic Control
Urban traffic signal control for fuel economy. Part 2. Extension to small cars, 7:57210 (AD-A—109393/9)
AUTOMOTIVE FUELS
See also GASOLINE
HYDROGEN FUELS
Comparative Evaluations
Cost parity between hydrogen and petroleum transportation fuels (f.o.b. plant), 7:57298
Cost
Cost parity between hydrogen and petroleum transportation fuels (f.o.b. plant), 7:57298
Performance
Emission characterization of an alcohol/diesel-pilot fueled compression-ignition engine and its heavy-duty diesel counterpart. Final report, August 1980-August 1981, 7:57297 (PB—82-154113)
AUTORADIOGRAPHS
See IMAGES
AUXILIARY SYSTEMS
Availability
Implementation and use of FRANTIC for time dependent unavailability analysis, 7:56931 (STUDSVIK-SD—81-82)

B

BABCOCK AND WILCOX-DUPONT PROCESS
Conceptual project study for anthracite coal gasification to produce fuels and chemicals, NEPGAS project, 7:56002 (DOE/RA/20221—T1-Vol.1)
BACK CONTACT SOLAR CELLS
Mathematical Models
Theoretical analysis of an AlGaAs/AlGaAs heteroface back-barrier solar cell. Master's thesis, 7:56486 (AD-A—111174/9)
BACTERIA
See also CLOSTRIDIUM
Bioluminescence
Comparison of bacterial luminescence and fish bioassay results for fossil-fuel process waters and phenolic constituents, 7:56058
Plant Growth
Utilization of carbohydrates by thermomonospora sp. grown on glucose, cellobiose, and cellulose, 7:56536
BAG MODEL
The MIT bag can accommodate the $\theta(1640)$ and I(1440) as glueballs, 7:58580 (PB—82-161563)
Hyperfine Structure
Hyperfine splittings of bag model gluonia, 7:58537 (PB—82-161555)
Wave Functions
Phase consistency and dissociated wavefunctions of Q^4 anti Q baryons, 7:58516 (UM-P—81/50)
BAGHOUSES
Fabric Filters
Fabric-filter design for application in the fluidized-bed combustion of coal, 7:56723 (DOE/ET/10123—1171)
Operation
Fabric-filter design for application in the fluidized-bed combustion of coal, 7:56723 (DOE/ET/10123—1171)
Performance Testing
Fabric-filter design for application in the fluidized-bed combustion of coal, 7:56723 (DOE/ET/10123—1171)
BAKELITE
Stopping Power
Inelastic interactions of low-energy electrons with organic solids: simple formulae for mean free paths and stopping powers, 7:58748
BALLOONING INSTABILITY
Comments on ideal ballooning, 7:58858 (EUR-CEA-FC—1083)
Numerical Solution
Electrostatic ballooning mode, 7:58880 (JAERI-M—9456)
BANKS
See COMMERCIAL BUILDINGS
BARIUM
Evaporation
Chemical stability of barium calcium aluminate dispenser-cathode impregnants, 7:57576 (ATR—82-8424-1)
Leaching
Subsolidus sintering of SYNROC: II. Materials selections, process improvements, waste form evaluations, 7:56309 (NCSU—81-3)
Pion Minus Reactions
Test of the interacting boson model using pion-nucleus inelastic scattering, 7:58678
Pion Plus Reactions
Test of the interacting boson model using pion-nucleus inelastic scattering, 7:58678
Vapor Pressure
Chemical stability of barium calcium aluminate dispenser-cathode impregnants, 7:57576 (ATR—82-8424-1)
BARIUM 134
Vibrational States
Octupole vibrations in the even-mass barium isotopes, 7:58667 (INIS-mf—7116)
BARIUM 134 TARGET
Alpha Reactions
Octupole vibrations in the even-mass barium isotopes, 7:58667 (INIS-mf—7116)

BARIUM 136
Vibrational States
Octupole vibrations in the even-mass barium isotopes, 7:58667 (INIS-mf—7116)
BARIUM 136 TARGET
Alpha Reactions
Octupole vibrations in the even-mass barium isotopes, 7:58667 (INIS-mf—7116)
BARIUM 138
Vibrational States
Octupole vibrations in the even-mass barium isotopes, 7:58667 (INIS-mf—7116)
BARIUM 138 TARGET
Alpha Reactions
Octupole vibrations in the even-mass barium isotopes, 7:58667 (INIS-mf—7116)
Pion Minus Reactions
Negative pion capture in atomic nuclei near the closed neutron shell at N=82, 7:58672 (JINR—E-15-81-270)
BARIUM 139
Szilard-Chalmers Reaction
First tests on recoil separation of alkali and alkaline earth elements with macrocyclic polyethers, 7:57686 (INIS-mf—7117)
BARIUM IONS
Adsorption
Effect of heavy metallic ions on fatty acid monolayers at the air—water interface, 7:57507
BARIUM OXIDES
Evaporation
Chemical stability of barium calcium aluminate dispenser-cathode impregnants, 7:57576 (ATR—82-8424-1)
Phase Diagrams
Chemical stability of barium calcium aluminate dispenser-cathode impregnants, 7:57576 (ATR—82-8424-1)
Isomorphism in quaternary mutual systems, $MeAl_2O_4$, $MeGa_2O_4$ long $2SiO_2$, $2GeO_2$ (Me = Ca, Sr, Ba), 7:57654 (INIS-SU—99)
Vapor Pressure
Chemical stability of barium calcium aluminate dispenser-cathode impregnants, 7:57576 (ATR—82-8424-1)
BARIUM SILICATES
Phase Diagrams
Polymorphism and phase interrelations of strontium and barium metasilicates, 7:57652 (INIS-SU—99)
BARNWELL FUEL PROCESSING PLANT
Communications
Coordination and display of nuclear facility technical and management data (Computerized communications and coordination center), 7:56392 (AGNS—35900-CONF-171)
Information Systems
Coordination and display of nuclear facility technical and management data (Computerized communications and coordination center), 7:56392 (AGNS—35900-CONF-171)
Management
Coordination and display of nuclear facility technical and management data (Computerized communications and coordination center), 7:56392 (AGNS—35900-CONF-171)
Nuclear Materials Management
Coordination and display of nuclear facility technical and management data (Computerized communications and coordination center), 7:56392 (AGNS—35900-CONF-171)
Radioactive Waste Disposal
Environmental assessment for the Barnwell low-level waste disposal facility, 7:56377 (NUREG—0879)
BARYON NUMBER
Symmetry Breaking
Hydrogen-antihydrogen oscillations and spontaneously broken global B—L symmetry, 7:58542
BARYON NUMBER 2 RESONANCES
See DIBARYON RESONANCES
BARYON RESONANCES
See also DIBARYON RESONANCES
Exotic Resonances
Exotic baryon resonances with isospins (>=)5/2, 7:58450 (EFI—462(4)-81)
Particle Decay
Exotic baryon resonances with isospins (>=)5/2, 7:58450 (EFI—462(4)-81)
BARYONIUM
Electromagnetic Particle Decay
Electromagnetic decay widths for L=1, Jsup(PC)=1^{--} T-baryonia: II, 7:58515 (UM-P—81/43)
BARYONS
See also BARYON RESONANCES
HYPERONS
Bound State
Simulation of baryon like quark bound states with V(r)=-$g^2r^{-1}(1\text{-}a^2r^2)$, 7:58498 (JINR—R-2-81-553)
Mass Formulae
Baryon masses in a relativistic quark-diquark model, 7:58528
Particle Production
Models for polarization asymmetry in inclusive hadron production, 7:58453 (HU-TFT—81-35)
Quark Model
Simulation of baryon like quark bound states with V(r)=-$g^2r^{-1}(1\text{-}a^2r^2)$, 7:58498 (JINR—R-2-81-553)
String Models
Flavour and spin structure of linear baryons, 7:58457 (IC—79/8)
BASALT
Leaching
Geochemical behavior of supercalcine waste form: its stability in a basalt environment, 7:56330 (RHO-BWI-C—105)
Petrology
Apollo 12 feldspathic basalts 12031, 12038 and 12072 - Petrology, comparison and interpretations, 7:58315
Stability
Preliminary assessment of the rate of deformation in the Pasco Basin, south-central Washington, 7:56331 (RHO-BWI-SA—133)
Tectonics
Preliminary assessment of the rate of deformation in the Pasco Basin, south-central Washington, 7:56331 (RHO-BWI-SA—133)
BATTELLE PACIFIC NORTHWEST LABORATORIES
Radioactive Waste Processing
Feasibility of incinerating and vitrifying organic resins in a single step, 7:56325 (PNL-SA—10269)
BATTERIES (ELECTRIC)
See ELECTRIC BATTERIES
BATTERY SEPARATORS
Design
Polymer packaged cell in a sack, 7:57033
Materials
Cross-linked polyvinyl alcohol films as alkaline battery separators, 7:57026 (NASA-TM—82802)
Testing
Ceramic separators for high-temperature lithium aluminum-iron sulfide batteries, 7:57043
Wettability
Method of enhancing the wettability of boron nitride for use as an electrochemical cell separator, 7:57034
BEAM BENDING MAGNETS
Power Supplies
Pulsed power supply for injection bump magnets, 7:57971
BEAM BUNCHERS
Optimization
Buncher system parameter optimization, 7:57895
BEAM EMITTANCE
Measuring Methods
Measuring beam emittance for high-energy H/sup -/ accelerators, 7:57864
BEAM EXTRACTION
Computer Codes
Beam, an improved beam extraction and acceleration modeling code, 7:57940
BEAM INJECTION
Computerized Simulation
QUARTZ - A numerical simulation of an asymmetric electrostatic accelerator, 7:57972

Magnets
Mechanical design of Lambertson magnets for injection into the energy saver, 7:57929
BEAM INJECTION HEATING
Energy deposition profiles in fast neutral injection experiments, 7:58845 (EUR—6584(Vol.1))
Neutral injection heating of toroidal plasma to ignition, 7:58844 (EUR—6584(Vol.1))
Plasma heating. Various methods of supplementary heating, 7:58879 (IPPJ-DT—79)
Systems Analysis
Overview of neutral beam injector technology developments at universities, 7:58993 (IPPJ—503)
BEAM PRODUCTION
Ion Beams
Ion beam generation on Reiden III, 7:58988 (ILE—8005P)
BEAM-PLASMA SYSTEMS
Numerical study on the interaction between a modulated electron beam and a plasma, 7:58874 (IPPJ—543)
Parametric Instabilities
Parametric instabilities in an electron beam-plasma system: magnetic field effects, 7:58859 (EUR-CEA-FC—1117)
Plasma Diagnostics
Particle-beam fusion experiments and diagnostics, 7:58951
BEES
See INSECTS
BELGIAN REACTOR 2
See BR-2 REACTOR
BELGIUM
Air Quality
National research and development program: environmental air. Summary. Final report, 1975-1978, 7:58113
BELOYARSK-3 REACTOR
Carbon Meters
Equipment for BN-600 reactor primary coolant sampling and analysis, 7:56845
Reactor Operation
Review of fast-reactor development in the USSR, 7:56776 (RISLEY-Trans—3322)
Specifications
Review of fast-reactor development in the USSR, 7:56776 (RISLEY-Trans—3322)
BENTONITE
Borehole sealing with highly compactd Na bentonite, 7:56336 (SKBF-KBS-TR—81-09)
Geochemistry
Nuclear-waste-package program for high-level isolation in Nevada tuff, 7:56337 (UCRL—87091)
BENZENE
Combustion Products
Nitrogen-containing polycyclic aromatic compounds in sooting flames, 7:56057
Gas Chromatography
Fundamental studies of separation processes. Technical progress report, 15 August 1981-14 August 1982, 7:57543 (DOE/ER/00854—38)
BENZOPHENONE
Excited States
Orbital rotation in the lowest triplet state of benzophenone, 7:57695
Structural Chemical Analysis
Orbital rotation in the lowest triplet state of benzophenone, 7:57695
BENZOPYRENE
Environmental Transport
Simulated transport of polycyclic aromatic hydrocarbons in artificial streams, 7:58157 (CONF-810488—4)
Infrared Spectra
Diffuse reflectance infrared Fourier-Transform spectra of selected organic compounds, 7:57691 (ORNL/TM—8321)
BENZOQUINONES
Electron Transfer
Benzoquinone quenching of diporphyrin excited states: kinetic evidence for distinguishing electron-transfer photoproducts from (π,π^*) states, 7:57701
Photochemistry
Benzoquinone quenching of diporphyrin excited states: kinetic evidence for distinguishing electron-transfer photoproducts from (π,π^*) states, 7:57701
BERGBAUFORSCHUNG PROCESS
Pilot Plants
Construction and operation of a prototype RESOX plant in conjunction with Bergbau-Forschung FGD system. Final report, 7:56039 (EPRI-CS—2467)
BERING SEA
Baseline Ecology
Environmental assessment of the Alaskan Continental Shelf: final reports of principal investigators, Volume 16. Biological studies, 7:56171 (PB—82-185653)
BERKELIUM
Thermodynamic Properties
Vapor pressure and thermodynamics of Bk-249 metal, 7:57381
Vapor Pressure
Vapor pressure and thermodynamics of Bk-249 metal, 7:57381
BERYLLIUM
Charged-Particle Transport
Electron energy and charge albedos - calorimetric measurement vs Monte Carlo theory, 7:58744 (SAND—80-1968)
Chemical Polishing
Cause of pitting in beryllium, 7:57379 (UCRL—87370)
Defects
Cause of pitting in beryllium, 7:57379 (UCRL—87370)
Electron Collisions
Electron energy and charge albedos - calorimetric measurement vs Monte Carlo theory, 7:58744 (SAND—80-1968)
Hot Pressing
Cause of pitting in beryllium, 7:57379 (UCRL—87370)
Laser Spectroscopy
Real-time monitoring of airborne beryllium, at OSHA limit levels, by time-resolved laser-induced breakdown spectroscopy, 7:58074 (LA-UR—82-1363)
Monitoring
Real-time monitoring of airborne beryllium, at OSHA limit levels, by time-resolved laser-induced breakdown spectroscopy, 7:58074 (LA-UR—82-1363)
Wave Propagation
Shock compression measurements at 1 to 7 TPa, 7:57387
BERYLLIUM 7
Annual Variations
Balance of the tropospheric ozone and its relation to stratospheric intrusions indicated by cosmogenic radionuclides. Technical progress report, November 1, 1981-June 30, 1982, 7:58058 (DOE/ET/03425—22)
BERYLLIUM 9
Hypernuclei
Strangeness exchange reactions and hypernuclei, 7:58606 (BNL—31674)
BERYLLIUM 9 TARGET
Kaon Minus Reactions
Strangeness exchange reactions and hypernuclei, 7:58606 (BNL—31674)
Proton Reactions
^{9}Be(p,π^{+-}) reactions at intermediate energies, 7:58618 (INIS-mf—7116)
BERYLLIUM ALLOYS
Molecular Structure
^{9}B Knight shift and line width behaviour of amorphous Be-Nb-Zr and Be-Mo-Zr alloys, 7:57334 (INIS-mf—7059-Vol.1)
Specific Heat
Specific heat of well-characterized $TiBe_2$ at 0 and 7 T, 7:57396
BERYLLIUM COMPLEXES
Stereochemistry
Stereodynamics and ligand exchange of tetracoordinated chelate compounds of metals (2), 7:57622 (INIS-SU—86)
Structural Chemical Analysis
Theoretical investigation of structural non-rigidity of complex molecules L/sub n/MX/sub k+n/ and (L/sub n/MX/sub k+n/)$_2$, 7:57644 (INIS-SU—86)

BERYLLIUM MODERATORS
See BERYLLIUM
BETA DOSIMETRY
Thermoluminescent Dosemeters
Quantitative relations between beta-gamma mixed-field dosimeter responses and dose-equivalent conversion factors according to the testing standard, 7:57979 (EGG-SHS—5934)
BETATRONS
Beam Dynamics
Transverse beam dynamics in the modified betatron. Memorandum report, 7:57790 (AD-A—111682/1)
BETTIS
Gaseous Wastes
Annual effluent and environmental monitoring report for calendar year 1981, 7:56386 (WAPD-RC/E(ESE)—576)
Liquid Wastes
Annual effluent and environmental monitoring report for calendar year 1981, 7:56386 (WAPD-RC/E(ESE)—576)
BGC-LURGI SLAGGING PROCESS
Demonstration Plants
Synthetic fuels from coal. Part II, 7:56022
BICARBONATES
See ACID CARBONATES
BIG ROCK POINT REACTOR
Reactor Licensing
Systematic evaluation program. Status summary report, 7:56879 (NUREG—0485-Vol.4-No.7)
BILLITONITES
See TEKTITES
BINARY STARS
Star Accretion
Two-second variability in AM Herculis binaries, 7:58308
Stellar Flares
Numerical studies of gravitational accretion from x-ray heated stellar winds. Doctoral thesis, 7:58292 (AD-A—110098/1)
X Radiation
Short-timescale variability in cataclysmic binaries, 7:58299 (LA-UR—82-1945)
BINARY-FLUID SYSTEMS
Direct Contact Heat Exchangers
Direct contact, binary fluid geothermal boiler (Patent), 7:56647
BIOCONVERSION
See also ANAEROBIC DIGESTION
BIOPHOTOLYSIS
Technology Assessment
Process catalog for synfuel technologies in Texas, 7:56006 (PB—82-159955)
BIOLOGICAL FOULING
Monitoring
Ecological investigations of petroleum production platforms in the central Gulf of Mexico: volume II. Final report 1978, 7:56148 (PB—82-167826)
BIOLOGICAL MODELS
Input-Output Analysis
On structural identification, 7:58187
BIOLOGICAL REPAIR
Biological Indicators
Immunochemical approach to the study of DNA repair. Proposed technical program and technical progress report, 7:58230 (DOE/EV/10417—2)
Biological Models
Immunochemical approach to the study of DNA repair. Proposed technical program and technical progress report, 7:58230 (DOE/EV/10417—2)
Genetic Variability
Genetics of x-ray induced double strand break repair in saccharomyces cerevisiae, 7:58235 (LBL—14684)
Temperature Dependence
Genetics of x-ray induced double strand break repair in saccharomyces cerevisiae, 7:58235 (LBL—14684)
BIOMASS
(All growing organic matter such as plants, trees, grasses, and algae.)
See also AGRICULTURAL WASTES
ALGAE
MANURES
TREES
WOOD
WOOD WASTES
Availability
Assessment of how the forest production which is currently not used would be obtained for energy purposes and from this an evaluation of the management methods most appropriate to the production of wood for energy purposes, 7:56507 (EUR—7550-EN)
Conversion
Biomass in the North Central United States, 7:56514 (MASEC-CF—81-096)
Daily Variations
OTEC environmental benchmark survey Kahe Point, Oahu, May 1980-May 1981. Final report, 7:58174 (DOE/NBM—2016055)
Fermentation
Ethanol production via fungal decomposition and fermentation of biomass. Semiannual progress report, October 1981-March 1982, 7:56487 (ANL/EES-TM—187)
Gasification
Energy recovery by gasification of agricultural and forestry wastes in a co-current moving bed reactor, 7:56510 (EUR—7594-EN)
Meetings
Coal and biomass: the role of synfuels. Conference and workshop summaries, 7:57110 (DOE/ER/10206—1)
Research Programs
Summary of biomass research programs at Oak Ridge National Laboratory, 7:56489 (CONF-820730—1)
Resource Potential
Biomass in the North Central United States, 7:56514 (MASEC-CF—81-096)
Seasonal Variations
OTEC environmental benchmark survey Kahe Point, Oahu, May 1980-May 1981. Final report, 7:58174 (DOE/NBM—2016055)
BIOMASS PLANTATIONS
Eucalyptuses
Eucalyptus plantations for energy production in Hawaii. 1980 annual report, January 1980-December 1980, 7:56547 (DOE/ET/20074—T7)
Operation
Eucalyptus plantations for energy production in Hawaii. 1980 annual report, January 1980-December 1980, 7:56547 (DOE/ET/20074—T7)
BIOPHOTOLYSIS
Biochemical Reaction Kinetics
Stochastic photolyisis: A new method for measuring rates of photosensitive reactions, 7:58121
Measuring Methods
Stochastic photolyisis: A new method for measuring rates of photosensitive reactions, 7:58121
Spectroscopy
Stochastic photolyisis: A new method for measuring rates of photosensitive reactions, 7:58121
BIOPHYSICS
Research Programs
Annual report 1981, 7:57083 (TRITA-TFY—82-1)
BIOSYNTHESIS
Biological Pathways
Embryo culture in teratological surveillance and serum proteins in development. Comprehensive fourteen year report, 1968-1982, 7:58223 (DOE/EV/03139—47)
BIPYRIDINES
Absorption Spectra
Laser studies of radiationless decay mechanisms in Os^{2+}/$^{3+}$ polypyridine complexes, 7:57577 (BNL—31632)
Radiationless Decay
Laser studies of radiationless decay mechanisms in Os^{2+}/$^{3+}$ polypyridine complexes, 7:57577 (BNL—31632)
BIRDS
See also FOWL
Baseline Ecology
Environmental assessment of the Alaskan Continental Shelf: final reports of principal investigators, volume 12. Biological studies, 7:56169 (PB—82-185638)

Environmental assessment of the Alaskan Continental Shelf: final reports of principal investigators, Volume 16. Biological studies, 7:56171 (PB—82-185653)
BISMUTH
Optical Properties
Optical properties of liquid Pb and Bi between 0.6 and 3.7 eV, 7:57391
BISMUTH 209 TARGET
Photofission
Absolute determination of the photofission cross section of ^{209}Bi with monochromatic gamma radiation between 40 and 65 MeV, 7:58688 (INIS-mf—7110)
Proton Reactions
Pion production by target emission, 7:58630
Xenon 136 Reactions
Dissipative reaction dynamics of heavy-ion collisions, 7:58698
BISMUTH COMPOUNDS
Chemical Preparation
Preparation and properties of ternary rare earth chalcopnictides, 7:57591 (INIS-SU—86)
Physical Properties
Preparation and properties of ternary rare earth chalcopnictides, 7:57591 (INIS-SU—86)
BITUMINOUS COAL
Combustion Products
Nitrogen-containing polycyclic aromatic compounds in sooting flames, 7:56057
BLACK CHROME
Optical Properties
Percolation-type behavior in black chrome selective solar films, 7:57502
BLANKETS (BREEDING)
See BREEDING BLANKETS
BLOCH THEORY
Hamiltonians
Almost periodic Hamiltonians: an algebraic approach, 7:58802 (CNRS-CPT—81-P-1311)
BLOOD
Radionuclide Kinetics
Tritium levels in the blood and urine of the normal population and in contaminated subjects, 7:58229 (CNEN-RT/PROT—(80)37)
BLOOD SERUM
Activation Analysis
Multielemental analysis by proton nuclear activation in human serum, 7:57544 (INFN/TC—80/15)
BLOWDOWN
Critical Heat Flux
Critical heat flux predictions during blowdown transients (CODA code, HETRAP code.), 7:56994
BN-1600 REACTOR
Specifications
Review of fast-reactor development in the USSR, 7:56776 (RISLEY-Trans—3322)
BN-350 REACTOR
Reactor Operation
Review of fast-reactor development in the USSR, 7:56776 (RISLEY-Trans—3322)
Specifications
Review of fast-reactor development in the USSR, 7:56776 (RISLEY-Trans—3322)
BN-600 REACTOR
See BELOYARSK-3 REACTOR
BNL
(Brookhaven National Laboratory.)
Reactor Safety
Safety research programs sponsored by Office of Nuclear Regulatory Research. Quarterly progress report, October 1-December 31, 1981, 7:56977 (NUREG/CR—2331-Vol.1-No.4)
BOHUNICE A-1 REACTOR
Environmental Impacts
Evaluation of radiation hygiene impacts of A-1 nuclear power plant operation, 7:58116 (INIS-mf—7092)
Radioactive Waste Storage
Disposal of radioactive wastes at the locality of the Bohunice nuclear power plant, 7:56944 (INIS-mf—7092)
BOHUNICE V-1 REACTOR
Radioactive Waste Storage
Disposal of radioactive wastes at the locality of the Bohunice nuclear power plant, 7:56944 (INIS-mf—7092)
BOHUNICE V-2 REACTOR
Radioactive Waste Storage
Disposal of radioactive wastes at the locality of the Bohunice nuclear power plant, 7:56944 (INIS-mf—7092)
BOILER FUELS
Fuel Substitution
Feasibility study on the conversion of Air Force oil-fired heat plants to coal-oil-mixture fired plants. Master's thesis, 7:57836 (AD-A—110215/1)
BOILERS
Acoustic Monitoring
An instrumental acoustic system for early diagnosis of the rupture of tube systems, 7:56716 (PB—82-162900)
Corrosion
Corrosion in coal-fired boilers, 7:56710 (GAT-S—24/Rev.1)
Electric utility use of fireside additives. Final report, 7:56100 (EPRI-CS—1318)
Naturally occurring high chloride coal and superheater corrosion - a laboratory study, 7:56103
Energy Efficiency
Energy-Exchange Project, 7:57267 (DOE/CS/20468—T1-Vol.2)
Fouling
Electric utility use of fireside additives. Final report, 7:56100 (EPRI-CS—1318)
Fuel Economy
Choice of boiler installation in terms of energy conservation (lecture), 7:57229 (PB—82-162462)
Fuel Substitution
Environmental factors influencing the use of coal as a marine boiler fuel. Final report 8 May 1981-15 February 1982, 7:56050 (PB—82-171455)
Heat Transfer
Heat transfer in slagging MHD radiant boilers, 7:57148
Performance
Electric utility use of fireside additives. Final report, 7:56100 (EPRI-CS—1318)
Reliability
Electric utility use of fireside additives. Final report, 7:56100 (EPRI-CS—1318)
Retrofitting
Feasibility study on the conversion of Air Force oil-fired heat plants to coal-oil-mixture fired plants. Master's thesis, 7:57836 (AD-A—110215/1)
BOILING WATER REACTORS

Aerosol Monitoring
Particle sampling and analysis in the California San Joaquin Valley. Final report Jul 78-Jul 80, 7:58080 (PB—82-164369)
Carbon 12 Reactions
Heavy ion fragmentation at intermediate energy. Memorandum report, 7:57910 (AD-A—111451/1)
Charged-Particle Transport
Electron energy and charge albedos - calorimetric measurement vs Monte Carlo theory, 7:58744 (SAND—80-1968)
Experiments concerning electron capture and loss to the continuum and convoy electron production by highly ionized projectiles in the 0.7—8.5-MeV/u range traversing the rare gases, polycrystalline solids, and axial channels in gold, 7:58746
Deposition
Investigation of mechanically hard, chemically inert antireflection coatings for photovoltaic solar modules. Final technical report, April 1, 1980-March 31, 1981, 7:56524 (SERI/TR—9010-3-T1)
Electric Conductivity
Resistance probe for energetic particle dosimetry with applications for plasma edge studies, 7:57504
Electron Collisions
Electron energy and charge albedos - calorimetric measurement vs Monte Carlo theory, 7:58744 (SAND—80-1968)
Electron Emission
Convoy electron production in heavy-ion-solid collisions, 7:58341 (CONF-810728—6)
Ion Collisions
Convoy electron production in heavy-ion-solid collisions, 7:58341 (CONF-810728—6)
Ion Implantation
Resistance probe for energetic particle dosimetry with applications for plasma edge studies, 7:57504
Ion-Atom Collisions
Asymptotic, Pade approximant method for legendre series, 7:58393
Optical Properties
Investigation of mechanically hard, chemically inert antireflection coatings for photovoltaic solar modules. Final technical report, April 1, 1980-March 31, 1981, 7:56524 (SERI/TR—9010-3-T1)

CARBON 11
Hot Atom Chemistry
γn-recoil produced compounds, 7:57740 (INIS-mf—7117)
Isotope Production
γn-recoil produced compounds, 7:57740 (INIS-mf—7117)
New preparations for cyclotron radionuclide labelling in the development of radiopharmaceutics, 7:57736 (INIS-mf—7117)
Radiochemistry
New preparations for cyclotron radionuclide labelling in the development of radiopharmaceutics, 7:57736 (INIS-mf—7117)

CARBON 12
Energy Levels
4^- states of ^{12}C, 7:58609 (INIS-mf—7116)
Excitation of low spin states in the ^{12}C(p,p′) reaction at 800 MeV, 7:58624
Pion-nucleus inelastic scattering at 80 MeV, 7:58627

CARBON 12 REACTIONS
Compound-Nucleus Reactions
^{12}C + ^{12}C: 1. Decay into high spin states of ^{23}Mg, and ^{23}Na. 2. Hauser-Feshbach analysis of the reaction mechanism, 7:58619 (INIS-mf—7144)
Light-ion emission in heavy-ion collisions: Beam energy dependence, 7:58652
Elastic Scattering
Study of the resonance behaviour of the systems ^{12}C + ^{12}C and ^{14}C + ^{14}C, 7:58621 (INIS-mf—7179)
Fission
Investigation of time components of the ^{238}U+^{12}C and W+^{22}Ne fission reactions, 7:58706 (JINR-R—7-81-184)
Fragmentation
Heavy ion fragmentation at intermediate energy. Memorandum report, 7:57910 (AD-A—111451/1)
Inelastic Scattering
Study of the resonance behaviour of the systems ^{12}C + ^{12}C and ^{14}C + ^{14}C, 7:58621 (INIS-mf—7179)

CARBON 12 TARGET
Alpha Reactions
Search for decays of superdense nuclei in a two-meter propane chamber, 7:58651 (JINR-R—1-81-258)
Carbon 12 Reactions
^{12}C + ^{12}C: 1. Decay into high spin states of ^{23}Mg, and ^{23}Na. 2. Hauser-Feshbach analysis of the reaction mechanism, 7:58619 (INIS-mf—7144)
Search for decays of superdense nuclei in a two-meter propane chamber, 7:58651 (JINR-R—1-81-258)
Study of the resonance behaviour of the systems ^{12}C + ^{12}C and ^{14}C + ^{14}C, 7:58621 (INIS-mf—7179)
Kaon Minus Reactions
Kaon scattering from C and Ca at 800 MeV/c, 7:58628
Strangeness exchange reactions and hypernuclei, 7:58606 (BNL—31674)
Kaon Plus Reactions
Kaon scattering from C and Ca at 800 MeV/c, 7:58628
Neutron Reactions
Thermal neutron capture cross section of deuterium, 7:58604
Photonuclear Reactions
A-dependence of cumulative photoprotons, 7:58663 (EFI—471(14)-81)
Spectra of cumulative protons in the γ^{12}C (yields) PX process at γ -quanta maximum energy 4.5 GeV, 7:58416 (EFI—467(9)-81)
Pion Reactions
4^- states of ^{12}C, 7:58609 (INIS-mf—7116)
Pion-nucleus inelastic scattering at 80 MeV, 7:58627
Proton Reactions
Excitation of low spin states in the ^{12}C(p,p′) reaction at 800 MeV, 7:58624
Models of pion production and a quark model of the physics at short distance, 7:58605
Pion production by target emission, 7:58630
Search for decays of superdense nuclei in a two-meter propane chamber, 7:58651 (JINR-R—1-81-258)

CARBON 13
Energy Levels
Inelastic proton scattering from ^{13}C at 135 MeV, 7:58617 (INIS-mf—7116)
Hypernuclei
Strangeness exchange reactions and hypernuclei, 7:58606 (BNL—31674)
Proton Reactions
Overview of experimental trends and systematics in pion production and absorption in nuclei, 7:58629

CARBON 13 TARGET
Alpha Reactions
^{13}C(α,p)^{16}N reaction at 118 MeV, 7:58614 (INIS-mf—7116)
Kaon Minus Reactions
Strangeness exchange reactions and hypernuclei, 7:58606 (BNL—31674)
Lithium 6 Reactions
Widths of the 4^- states in ^{16}O as measured by the ^{13}(^{6}Li,t)^{16}O reaction, 7:58613 (INIS-mf—7116)
Photonuclear Reactions
Photonuclear reactions in p-shell nuclei, 7:58611 (INIS-mf—7116)
Proton Reactions
Inelastic proton scattering from ^{13}C at 135 MeV, 7:58617 (INIS-mf—7116)

CARBON 14
Removal
Noble gas removal and concentration by combining fluorocarbon absorption and adsorption technologies, 7:56306 (K/PS—5002)

Metabolism
Blood carbon monoxide levels in persons 3 to 74 years of age: United States, 1976-1980, 7:58264
Monitoring
Hazard evaluation and technical assistance Report No. Ta 77-79, Department of Housing and Urban Development, Washington, DC, 7:58078 (PB—82-157769)
Methodology for estimating emissions from off-highway mobile sources for the RAPS program. Final report March-September 1974, 7:58086 (PB—82-169913)
Monitoring of mine air diesel pollutants: tailpipe emissions measurement apparatus, detector tube interferences, and exhaust and ventilation system control. Annual report 1 Aug 79-31 Jul 80, 7:56071 (PB—82-148388)
Oxidation
Fundamental and semi-global kinetic mechanisms of hydrocarbon combustion. Annual report, 1 July 1981-30 June 1982, 7:56446 (DOE/PC/40283—T1)
Raman Spectra
Background-free CARS studies of carbon monoxide in a flame, 7:56451
Raman spectra of CO adsorbed on Ni(100), 7:56450

CARBON OXIDES
See also CARBON DIOXIDE
CARBON MONOXIDE
Photoelectron Spectroscopy
Angle resolved photoelectron spectroscopy of CS_2 and COS measured as a function of photon energy from 21 to 70 eV, 7:57561

CARBON STEELS
See also STEEL-ASTM-A533-B
Bubble Growth
Model for the growth of hydrogen attack cavities in carbon steels, 7:57403
Erosion
Erosion mechanisms of metals. Annual report 1 Oct 80-30 Sep 81, 7:57309 (AD-A—111537/7)
Hydrogen Embrittlement
Model for the growth of hydrogen attack cavities in carbon steels, 7:57403
Manufacturing
Bare carbon steel electrodes and fluxes for submerged arc welding (ASME SFA-5.17 with additional requirements), 7:56933 (NE-M—1-17T-Rev.-8-82)

CARBON SULFIDES
Photoelectron Spectroscopy
Angle resolved photoelectron spectroscopy of CS_2 and COS measured as a function of photon energy from 21 to 70 eV, 7:57561

CARBONATE ROCKS
See also LIMESTONE
Permeability
Thermally induced chemical migration in carbonate rocks. Final project report, 7:58283 (DOE/ER/10412—T1)
Radionuclide Migration
Thermally induced chemical migration in carbonate rocks. Final project report, 7:58283 (DOE/ER/10412—T1)

CARBONYLS
Catalytic Effects
Contribution to radiation-chemically catalyzed hydroformylation of butenes in the presence of metal carbonyls (Gamma rays), 7:57704 (INIS-mf—7184)
Infrared Spectra
Application of PAS for the investigation of overtones and combination in the near IR, 7:57525
Photoacoustic Spectroscopy
Application of PAS for the investigation of overtones and combination in the near IR, 7:57525
Photolysis
Fast reaction studies of rhenium carbonyl complexes: the pentacarbonylrhenium(0) radical, 7:57708

CARBORANES
Chemical Preparation
Syntheses and reactions of new 9-10 atom carbaboranes, 7:57661 (INIS-SU—111)

CARBOXYHEMOGLOBIN
Chemical Analysis
Hazard evaluation and technical assistance Report No. Ta 77-79, Department of Housing and Urban Development, Washington, DC, 7:58078 (PB—82-157769)

CARBOXYLIC ACIDS
See also AMINO ACIDS
Sorptive Properties
Effect of heavy metallic ions on fatty acid monolayers at the air—water interface, 7:57507

CARCINOGEN SCREENING
Feasibility Studies
Development of a biological screening method to detect potential exposure of synfuel plant workers to carcinogenic substances. Final report, 7:58261 (PB—82-192709)

CARCINOGENESIS
Correlations
Extrapolation of mutagenicity testing to the human, 7:58263 (UCRL—87003)

CARCINOGENS
Bioassay
Development of a biological screening method to detect potential exposure of synfuel plant workers to carcinogenic substances. Final report, 7:58261 (PB—82-192709)

CASCADE MOUNTAINS
Geothermal Exploration
Geothermal exploration: philosophy, methods, impacts, land positions and problems, 7:56629
Geothermal potential of the Cascades, 7:56632
Geothermal Resources
Geothermal potential of the Cascade Mountain Range: exploration and development. Special report No. 10, 7:56624 (CONF-810572—)
Resource Potential
Geothermal potential of the Cascades, 7:56632

CASKS
Leaks
Depleted uranium dioxide powder flow through very small openings, 7:56285
Restraints
Evaluation of proposed methods of radioactive material container tie-down design for truck transport, 7:56288
Thermal Analysis
Vitrification of high-level wastes: A review of the computer thermal analysis for storage canisters (CANIST), 7:57770

CASTLE PROJECT
Operation Castle. Pacific Proving Grounds, spring of 1954. Report of Commander, Task Group 7.5, 7:58044 (AD-A—995141/9)
Pressure Measurement
Air pressure measurements, 7:58032 (AD—362095/2)
Shock Waves
Air pressure measurements, 7:58032 (AD—362095/2)

CAT SCANNING
Diagnostic Uses
Task force report on computerized tomographic scanners, 7:58212 (HRP—0903872/0)
Regional Analysis
Computed tomography (CT) scanning in mid-Michigan, 1981, 7:58215 (HRP—0904070/0)

CATALYST SUPPORTS
Performance Testing
Carbon supports for phosphoric acid fuel cell electrocatalysts: alternative materials and methods of evaluation, 7:57162

CATALYSTS
Chemical Preparation
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Eighth quarterly report, June 15, 1980-September 15, 1980, 7:55981 (DOE/ET/11429—8)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Ninth quarterly report, September 15, 1980-December 15, 1980, 7:55982 (DOE/ET/11429—9)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Eleventh quarterly report, March 15, 1981-September 15, 1981, 7:55983 (DOE/ET/11429—11)

Performance Testing
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Eighth quarterly report, June 15, 1980-September 15, 1980, 7:55981 (DOE/ET/11429—8)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Ninth quarterly report, September 15, 1980-December 15, 1980, 7:55982 (DOE/ET/11429—9)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Eleventh quarterly report, March 15, 1981-September 15, 1981, 7:55983 (DOE/ET/11429—11)
CATALYTIC COMBUSTORS
Fuel Substitution
Low NO/sub x/ Heavy Fuel Combustor Concept Program. Phase I. Final report, 7:57838 (DOE/NASA/0147—1)
Mathematical Models
Transient catalytic combustor model, 7:57840 (DOE/NASA/3230—1)
Operation
Transient catalytic combustor model, 7:57840 (DOE/NASA/3230—1)
Performance
Low NO/sub x/ Heavy Fuel Combustor Concept Program. Phase I. Final report, 7:57838 (DOE/NASA/0147—1)
CATAPHORESIS
See ELECTROPHORESIS
CATAWBA-1 REACTOR
Environmental Impact Statements
Draft Environmental Statement related to the operation of Catawba Nuclear Station, Units 1 and 2. Docket Nos. 50-413 and 50-414, Duke Power Company, et al, 7:56945 (NUREG—0921)
CATAWBA-2 REACTOR
Environmental Impact Statements
Draft Environmental Statement related to the operation of Catawba Nuclear Station, Units 1 and 2. Docket Nos. 50-413 and 50-414, Duke Power Company, et al, 7:56945 (NUREG—0921)
CATECHOL
See PYROCATECHOL
CATHODES
Electron Emission
Chemical stability of barium calcium aluminate dispenser-cathode impregnants, 7:57576 (ATR—82-8424-1)
Study of cathode edge emission, 7:57508
Impregnation
Chemical stability of barium calcium aluminate dispenser-cathode impregnants, 7:57576 (ATR—82-8424-1)
CATION EXCHANGE CAPACITY
See ION EXCHANGE
CATTLE
Data Compilation
Agricultural production in the United States by county: a compilation of information from the 1974 census of agriculture for use in terrestrial food-chain transport and assessment models, 7:58137 (ORNL—5768)
CAUSTIC FLOODING
Additives
Additives for alkaline recovery of heavy oil, 7:56122 (CONF-820712—)
Demonstration Programs
Alkaline waterflooding demonstration project ranger zone, Long Beach unit, Wilmington Field, California (period May 1981-April 1982), 7:56124 (CONF-820712—)
CAVITY RESONATORS
Design
Investigation of the disc-and-washer structure, 7:57905
CELLOBIOSE
Fermentation
Utilization of carbohydrates by thermomonospora sp. grown on glucose, cellobiose, and cellulose, 7:56536
CELLS (ANIMAL)
See ANIMAL CELLS
CELLS (BACTERIAL)
See BACTERIA
CELLS (ELECTROLYTIC)
See ELECTROLYTIC CELLS
CELLULOSE
Fermentation
Utilization of carbohydrates by thermomonospora sp. grown on glucose, cellobiose, and cellulose, 7:56536
CEMENTS
Leaching
Experience in containment and leaching of PWR wastes embedded into the cement, 7:56294 (CEA-CONF—6054)
CENTRAL HEATING PLANTS
See also DISTRICT HEATING
Feasibility Studies
Tacoma refuse fired combustor study for the City of Tacoma, Washington, 7:57272 (NP—2901408)
Refuse Derived Fuels
Tacoma refuse fired combustor study for the City of Tacoma, Washington, 7:57272 (NP—2901408)
CENTRAL RECEIVERS
Comparative Evaluations
Evaluation of solar-air-heating central-receiver concepts, 7:56571 (PNL—4003)
CENTRIFUGAL PUMPS
Cleaning
Prediction of centrifugal pump cleaning ability in waste sludge, 7:56352
CERAMICS
Hydrothermal Alteration
Comparative study of hydrothermal stability experiments: application to simulated nuclear waste forms, 7:56371
Leaching
Comparison of glass and ceramic leaching behaviour by natural analogs, 7:56370
CEREALS
Maritime Transport
Great Lakes/St. Lawrence Seaway regional transportation study; Great Lakes area industries. Final report, 7:56080 (AD-A—111202/8)
CERIUM
Absorption Spectroscopy
Subsolidus sintering of SYNROC: I. Initial demonstrations, 7:56308 (NCSU—80-4)
Activation Analysis
Subsolidus sintering of SYNROC: I. Initial demonstrations, 7:56308 (NCSU—80-4)
Crystal-Phase Transformations
Addendum to the lattice dynamics of γ-Ce, 7:57394
Leaching
Subsolidus sintering of SYNROC: II. Materials selections, process improvements, waste form evaluations, 7:56309 (NCSU—81-3)
Subsolidus sintering of SYNROC: I. Initial demonstrations, 7:56308 (NCSU—80-4)
Phonons
Addendum to the lattice dynamics of γ-Ce, 7:57394
Pion Minus Reactions
Test of the interacting boson model using pion-nucleus inelastic scattering, 7:58678
Pion Plus Reactions
Test of the interacting boson model using pion-nucleus inelastic scattering, 7:58678
CERIUM 140 TARGET
Pion Minus Reactions
Negative pion capture in atomic nuclei near the closed neutron shell at N=82, 7:58672 (JINR—E-15-81-270)
CERIUM OXIDES
Thermal Diffusion
Cations redistribution in mixed oxides (U,Ce)O_2 and (U,Pu)O_2 under thermal gradient, 7:56257 (CEA-R—5139)
CERN
Research Programs
Annual report 1980, 7:57968
Progress report on CERN activities (June 1981), 7:58412 (CERN—81-18)
CESIUM
Absorption Spectroscopy
Subsolidus sintering of SYNROC: I. Initial demonstrations, 7:56308 (NCSU—80-4)

Activation Analysis
Application of neutron activation analysis to leach rate studies, 7:56389
Subsolidus sintering of SYNROC: I. Initial demonstrations, 7:56308 (NCSU—80-4)
Ion-Atom Collisions
Electronic energy transfer in near-resonant electron capture collisions of H^+_3 with metal atoms: Radiative and nonradiative transitions, 7:58372
Leaching
Application of neutron activation analysis to leach rate studies, 7:56389
Comparative study of hydrothermal stability experiments: application to simulated nuclear waste forms, 7:56371
Leach testing of SYNROC and glass samples at 85 and 200/degree/C, 7:56387
Subsolidus sintering of SYNROC: II. Materials selections, process improvements, waste form evaluations, 7:56309 (NCSU—81-3)
Subsolidus sintering of SYNROC: I. Initial demonstrations, 7:56308 (NCSU—80-4)
Solvent Extraction
Crown-ethers as the class of stereospecific reagents for separation of elements like in properties, 7:57551 (INIS-SU—86)
CESIUM 137
Radioecological Concentration
Environmental surveillance. Annual report for calendar year 1980, 7:58119 (RHO-LD—163)
CESIUM CHLORIDES
Neutron Diffraction
Neutron-scattering study of Cs_2CoCl_4: a system of 1D, S = 1/2 XY antiferromagnetic chains with spin frustration, 7:57474 (BNL—31682)
CESIUM IONS
Ionization
Absolute experimental cross sections for the electron impact single, double, triple, and quadruple ionization of Cs^+ ions, 7:58378
CESIUM NITRATES
Chemical Reactions
Formation of acidic salts in nitrate and iodate systems, 7:57607 (INIS-SU—86)
CHALCOGENIDES
See also *OXIDES*
SELENIDES
SULFIDES
TELLURIDES
Crystal Structure
Crystallochemical and physical properties of mixed europium chalcogenides of the $EuLn_2X_4$ type (Ln=rare earths from La to Yb; X=Se, S, Te), 7:57593 (INIS-SU—86)
Magnetic Properties
Physicochemical investigation of ternary rare earth chalcochalcochromites, 7:57604 (INIS-SU—86)
Thermoelectric Properties
Physicochemical investigation of ternary rare earth chalcochalcochromites, 7:57604 (INIS-SU—86)
CHALKS
See LIMESTONE
CHARGED PARTICLES
See also *ALPHA PARTICLES*
IONS
Wave Equations
Analog of the Feynman-Gell-Mann equation for a spin 1 charged particle, 7:58784 (JINR—R-2-81-403)
CHARGED-PARTICLE ACTIVATION
See CHARGED PARTICLES
CHARGING (REACTOR)
See REACTOR FUELING
CHARM PARTICLES
See also *CHARMED MESON RESONANCES*
Hadronic Particle Decay
Lifetimes of charmed particles produced in a 20-GeV γp experiment, 7:58436
Photoproduction
Lifetimes of charmed particles produced in a 20-GeV γp experiment, 7:58436
CHARMED MESON RESONANCES
Weak Hadronic Decay
Nonleptonic decays of charmed mesons, 7:58470 (INIS-mf—7116)
Weak Particle Decay
Hybrid model for charmed meson decays, 7:58514 (UM-P—81/42)
CHARMONIUM
Charmonium studies with the Crystal Ball, 7:58441
CHARS
Combustion
Combustion of pyrolysis char and liquefaction bottoms, 7:56462
Gasification
Importance of active sites for char gasification in oxygen (air) and carbon dioxide. Annual report Oct 80-Sep 81, 7:56009 (PB—82-180621)
CHELATES
Chemical Preparation
Correlations and forecast in the chemistry of chelates, 7:57634 (INIS-SU—86)
Chemical Properties
Correlations and forecast in the chemistry of chelates, 7:57634 (INIS-SU—86)
CHEMICAL EFFLUENTS
Environmental Transport
Annual effluent and environmental monitoring report for calendar year 1981, 7:56386 (WAPD-RC/E(ESE)—576)
CHEMICAL EXPLOSIONS
Data Transmission
Fiber Optic CODEC Link (FOCOL). Volume 1. Final report, 1 November 1978-26 January 1981, 7:58036 (AD-A—109480/4)
Fiber Optic CODEC Link (FOCOL). Volume 2 - manual. Final report, 1 November 1978-26 January 1981, 7:58037 (AD-A—109481/2)
Flame Propagation
Detonation-like explosion modes. Interim report, August 1979-December 1980, 7:58027 (BF-R—64.176-64.181-1)
Jets
Analysis of jetting simulation experiments. Technical report, 7:58041 (AD-A—109725/2)
Mathematical Models
Detonation-like explosion modes. Interim report, August 1979-December 1980, 7:58027 (BF-R—64.176-64.181-1)
Radiant Heat Transfer
Detonation-like explosion modes. Interim report, August 1979-December 1980, 7:58027 (BF-R—64.176-64.181-1)
Risk Assessment
Detonation-like explosion modes. Interim report, August 1979-December 1980, 7:58027 (BF-R—64.176-64.181-1)
CHEMICAL EXPLOSIVES
Blast Effects
Testing of shelter design and industrial hardening concepts at the Mill Race event. Final report, 7:57752 (AD-A—110919/8)
Detonations
Minefield clearance, 7:58031 (AD—357978/6)
Grueneisen Constant
Gruneisen-parameter measurements for high explosives, 7:58029 (UCRL—83838)
CHEMICAL HEAT PUMPS
Economic Analysis
Comparative economics and energy consumption of chemical heat pumps and competitive systems, 7:57021
CHEMICAL LASERS
Performance Testing
Hydrogen pumped iodine laser study. Final report May 1976-September 1979, 7:57784 (AD-A—111042/8)
CHEMICAL REACTION KINETICS
Lasers
Future developments in laser technology and their applications, 7:57570
CHEMICAL REACTIONS
See also *CORROSION*
FISCHER-TROPSCH SYNTHESIS
HYDROGENATION
OXIDATION

PHOTOSYNTHESIS
REFORMER PROCESSES
Electron Transfer
Low temperature free energy relations for electron transfer reactions, 7:58357
CHEMICAL REACTORS
See also RETORTS
Deposits
Effect of accumulated solids on dissolver performance, 7:55990 (DOE/OR/03054—6)
Energy Transport
Experimental study of SO_3 dissociation as a mechanism for converting and transporting solar energy, 7:56539
Performance
Effect of accumulated solids on dissolver performance, 7:55990 (DOE/OR/03054—6)
Performance Testing
Fischer-Tropsch studies with catalyst-sprayed tube wall reactors, 7:56447 (DOE/PETC/TR—82/14)
CHEMICAL SPILLS
See also GAS SPILLS
HAZARDOUS MATERIALS SPILLS
OIL SPILLS
Water Pollution Control
Hazard Assessment Computer System HACS/UOM users' operation manual. Volume II. Final report, 7:58154 (AD-A—110376/1)
CHEMISTRY
See also ATMOSPHERIC CHEMISTRY
NUCLEAR CHEMISTRY
RADIOCHEMISTRY
Meetings
Summaries of reports, presented by foreign scientists. Volume 7, 7:57538 (INIS-SU—111)
CHEMOTHERAPY
Side Effects
Correlation of chromosome patterns in human leukemic cells with exposure to chemicals and/or radiation. Comprehensive progress report, January 1, 1980-December 31, 1982, 7:58221 (DOE/EV/10360—3)
CHERENKOV RADIATION
Interactions
Electron momentum modulation by the stimulated Cerenkov interaction, 7:58791
CHINONE
See BENZOQUINONES
CHLORIDES
Corrosive Effects
Naturally occurring high chloride coal and superheater corrosion - a laboratory study, 7:56103
Ion Exchange Chromatography
Assessment of pellicular anion-exchange resins for the determination of anions by ion chromatography, 7:57558 (NIM—2132)
CHLORINATED AROMATIC HYDROCARBONS
Removal
Feasibility study of chemical detoxification of polychlorinated biphenyl capacitors. Phase I study. Final report, 7:58270 (EPRI-CS—2477)
CHLORINE
Chemisorption
Chemisorption of chlorine on metal oxides, 7:57656 (INIS-SU—111)
Environmental Impacts
Biofouling control assessment: a preliminary data base analysis. Final report, 7:58159 (EPRI-CS—2469)
CHLORINE 37
Isotope Effects
Chlorine isotope effects in ion exchange reactions with a strongly basic anion exchanger, 7:57590 (INIS-mf—7185)
CHLOROPHYLL
Absorption Spectra
Mutual orientation of pigments in photosystem I particles from green plants, 7:57697 (EUR—7592-EN)
Daily Variations
OTEC environmental benchmark survey Kahe Point, Oahu, May 1980-May 1981. Final report, 7:58174 (DOE/NBM—2016055)
Dichroism
Mutual orientation of pigments in photosystem I particles from green plants, 7:57697 (EUR—7592-EN)
Seasonal Variations
OTEC environmental benchmark survey Kahe Point, Oahu, May 1980-May 1981. Final report, 7:58174 (DOE/NBM—2016055)
CHLOROPLASTS
Binding Energy
Investigation of the properties of the primary electron-acceptor complex of photosystem I. Final report, 7:58191 (EUR—7683-EN)
CHLORPROMAZINE
Encapsulation
Membrane specific drugs as radiosensitizers, 7:58226 (BARC—1132)
Radiosensitivity Effects
Membrane specific drugs as radiosensitizers, 7:58226 (BARC—1132)
CHOPPERS (NEUTRON)
See NEUTRON CHOPPERS
CHORIOALLANTOIC MEMBRANE
See FETAL MEMBRANES
CHROMATES
Chemical Properties
New trends in phosphate chemistry: phosphate-tellurates and phospho-chromates, 7:57657 (INIS-SU—111)
CHROMIUM
Absorption Spectroscopy
Complete testing of the NIOSH method for the determination of trace metals by atomic absorption spectrophotometry, 7:58084 (PB—82-167743)
Biological Effects
Environmental assessment of the Alaskan Continental Shelf. Volume 5. Biological studies: assessment of available literature on effects of oil pollution on biota in arctic and subarctic waters. Final report 1 Jul 75-30 Sep 76, 7:56167 (PB—82-171794)
Leaching
Geochemical behavior of supercalcine waste form: its stability in a basalt environment, 7:56330 (RHO-BWI-C—105)
Mutagenesis
Chemical, physical and biological assay of welding fume. Part II: implications of positive mutagenic tests, 7:58114 (PB—82-156696)
CHROMIUM 51
Diffusion
Diffusion of ^{51}Cr in Cr-doped MgO, 7:57459
CHROMIUM 53
Energy Levels
Two-crystal compton polarimeter for nuclear structure measurements in ^{53}Cr and ^{55}Fe, 7:57983 (INIS-mf—7116)
CHROMIUM ALLOYS
See also CHROMIUM-NICKEL STEELS
NICKEL-CHROMIUM STEELS
Corrosion
Investigation of nonmetallic element interactions in vanadium-alloy/lithium systems, 7:59059
Studies of the low temperature hot corrosion of uncoated superalloys, 7:57307 (AD-A—110992/5)
Erosion
Erosion mechanisms of metals. Annual report 1 Oct 80-30 Sep 81, 7:57309 (AD-A—111537/7)
Materials Testing
Damage analysis and fundamental studies. Quarterly progress report, July-September 1981, 7:58963 (DOE/ER—0046/7)
Microstructure
Influence of alloy microstructure on Al_2O_3-peg morphologies in CoCrAl alloys and coatings, 7:57367 (LBL—14668)
Tensile Properties
Temperature dependence of tensile properties of 316 stainless steel, FeCrNiMo, FeCrNi, Ni-W and Ni foils, 7:57365 (Juel-Spez—128)

CHROMIUM COMPLEXES
Chemical Reactions
Reaction of isopropyl(pentaaquo)chromium(III) ion with molecular oxygen in aqueous solution: kinetics of the chain reaction and effects of chain-breaking reagents and of variable ionic strength, 7:57696
CHROMIUM COMPOUNDS
Chemical Preparation
Syntheses and electronic structures of decamethylmetallocenes, 7:57693
Chemical Reaction Yield
Reaction of isopropyl(pentaaquo)chromium(III) ion with molecular oxygen in aqueous solution: kinetics of the chain reaction and effects of chain-breaking reagents and of variable ionic strength, 7:57696
Electronic Structure
Syntheses and electronic structures of decamethylmetallocenes, 7:57693
Magnetic Properties
Physicochemical investigation of ternary rare earth chalcochalcochromites, 7:57604 (INIS-SU—86)
Photolysis
Vibrational fine structure in the valence ionizations of transition-metal hexacarbonyls: new experimental indication of metal-to-carbonyl π bonding, 7:57676
Thermoelectric Properties
Physicochemical investigation of ternary rare earth chalcochalcochromites, 7:57604 (INIS-SU—86)
CHROMIUM SILICIDES
Neutron Diffraction
Neutron scattering study of the lattice dynamics of Cr_3Si, 7:57532
Phonons
Neutron scattering study of the lattice dynamics of Cr_3Si, 7:57532
CHROMIUM-MOLYBDENUM STEELS
Castings
Chemical nonhomogeneity of large forging ingots, 7:56925 (INIS-mf—7093)
Corrosion
Compatibility of Fe-9Cr-Mo ferritic steels in a sodium environment, 7:56797
Creep-rupture behavior of Fe-2/one quarter/Cr-1Mo steel exposed to a sodium environment, 7:57413
Intergranular penetration of 2/one quarter/Cr-1Mo weldments by a lithium-lead liquid, 7:56821
Creep
Analysis of elevated-temperature tensile and creep properties of normalized and tempered 2 1/4 Cr-1 Mo steel, 7:57372 (ORNL/TM—8075)
Comparison between ductile and brittle creep behaviour in liquid sodium, 7:57415
Creep-rupture behavior of Fe-2/one quarter/Cr-1Mo steel exposed to a sodium environment, 7:57413
Fabrication
Manufacture of steels for reactor pressure vessels, 7:56759 (INIS-mf—7093)
Fatigue
Design and validation of an apparatus for high temperature fatigue testing in an inert environment. Master's thesis, 7:57306 (AD-A—110990/9)
Influence of sodium environment on the low-cycle fatigue and creep-fatigue behavior of Fe-2/one quarter/Cr-1Mo steel, 7:57414
Forging
2-1/4%-chromium, 1%-molybdenum alloy steel tubesheet forgings (ASME SA-336 with additional requirements), 7:56932 (NE-M—2-19T-Rev.-8-82)
Fracture Properties
2-1/4%-chromium, 1%-molybdenum alloy steel tubesheet forgings (ASME SA-336 with additional requirements), 7:56932 (NE-M—2-19T-Rev.-8-82)
Hydrogen Embrittlement
Optimization of steels susceptible to the action of hydrogen. Final report, 7:57321 (EUR—6887-FR)
Mechanical Properties
Optimization of steels susceptible to the action of hydrogen. Final report, 7:57321 (EUR—6887-FR)
Tensile Properties
Analysis of elevated-temperature tensile and creep properties of normalized and tempered 2 1/4 Cr-1 Mo steel, 7:57372 (ORNL/TM—8075)
CHROMIUM-NICKEL STEELS
(Steels containing Cr and Ni; the Ni content is usually 0.5 to 2.0%, the Cr content is higher.)
Fabrication
Manufacture of steels for reactor pressure vessels, 7:56759 (INIS-mf—7093)
Manufacturing
Cooling down to low temperatures as part of production technology for nuclear reactor control elements, 7:56941 (INIS-mf—7093)
Metallurgy
Problems of manufacturing special steels for WWER 440 reactor internals, 7:57353 (INIS-mf—7093)
Specifications
Spring steel 12Kh18N10T for WWER reactor internals, 7:57354 (INIS-mf—7093)
Tensile Properties
Effect of carbon and aluminium contents on the properties of forgings from chromium-nickel austenitic steel, 7:57351 (INIS-mf—7093)
CHROMODYNAMICS
See QUANTUM CHROMODYNAMICS
CHROMOSOMAL ABERRATIONS
Correlations
Correlation of chromosome patterns in human leukemic cells with exposure to chemicals and/or radiation. Comprehensive progress report, January 1, 1980-December 31, 1982, 7:58221 (DOE/EV/10360—3)
Dose-Response Relationships
Study of chromosome aberration yield in human lymphocytes as an indicator of radiation dose, 7:58233 (INER—0388)
CHROMOSOMES
Biological Indicators
Study of chromosome aberration yield in human lymphocytes as an indicator of radiation dose, 7:58233 (INER—0388)
Biological Radiation Effects
Genetics of x-ray induced double strand break repair in saccharomyces cerevisiae, 7:58235 (LBL—14684)
CHRYSENE
Infrared Spectra
Diffuse reflectance infrared Fourier-Transform spectra of selected organic compounds, 7:57691 (ORNL/TM—8321)
CIRCUIT BREAKERS
Design
Phototransistor switch for breaker applications. Final report, 7:56728 (EPRI-EL—2395)
Performance
Phototransistor switch for breaker applications. Final report, 7:56728 (EPRI-EL—2395)
CLAYS
Role of clays in enhanced recovery of petroleum, 7:56125 (CONF-820712—)
Freezing
Heat pump with vertical ground heat collectors and wind convectors. Evaluation of a full scale project in Utby 1979-1981-06-03, 7:57177 (CTH-JVG—2)
Temperature Effects
Laboratory determination of the thermal properties of large-scale samples of natural clays, 7:56296 (CNEN-RT/ING—81-12)
Thermal Conductivity
Laboratory determination of the thermal properties of large-scale samples of natural clays, 7:56296 (CNEN-RT/ING—81-12)
Thermal Diffusivity
Laboratory determination of the thermal properties of large-scale samples of natural clays, 7:56296 (CNEN-RT/ING—81-12)

CLEAN AIR ACT
  Pro and con: visibility protection, 7:58123
CLIMATES
  Isotope Dating
    Global isotopic model to interpret deuterium and oxygen 18 variations in rain and snow, 7:58145 (CEA-CONF—5875)
CLINCH RIVER BREEDER REACTOR
  Failed Element Detection
    Gas tag identification of failed reactor assemblies - 4. Analysis methods, 7:56791
  Fuel Elements
    Gas tag identification of failed reactor assemblies - 4. Analysis methods, 7:56791
  Management
    Technical management discipline in the Clinch River Breeder Reactor Plant project, 7:56909
CLINTON P ANDERSON MESON PHY. FACILITY
  See LAMPF LINAC
CLINTON-1 REACTOR
  Environmental Impact Statements
    Final environmental statement related to the operation of Clinton Power Station, Unit No. 1. Docket No. 50-461, 7:58186 (NUREG—0854)
CLIPPING CIRCUITS
  See PULSE SHAPERS
CLOSTRIDIUM
  Anaerobic Digestion
    Some aspects of thermophilic and extreme thermophilic anaerobic microorganisms, 7:58218
CO2 FLOODING
  See CARBON DIOXIDE INJECTION
COAL
  See also BITUMINOUS COAL
    Coal, coal's future and the US energy policy, 7:56116
  Calorific Value
    Preliminary assessment of alternative atmospheric fluidized-bed-combustion power-plant systems. Final report, 7:56705 (EPRI-CS—2275)
  Chemical Analysis
    Characterizing SRC-I products, 7:55995 (DOE/OR/03054—6)
    Cross-polarization magic angle spinning /sup 13/C NMR spectra of coals of varying rank, 7:56030
  Chemical Composition
    Investigation of coal devolatilization: kinetics and product characterization. Second quarterly report, 23 May 1981-23 August 1981, 7:56026 (DOE/MC/16221—T4)
    Preliminary assessment of alternative atmospheric fluidized-bed-combustion power-plant systems. Final report, 7:56705 (EPRI-CS—2275)
  Combustion
    CaO interaction in the staged combustion of coal. Seventh quarterly technical progress report, April 1, 1982-June 30, 1982, 7:56096 (DOE/PC/30301—7)
    Corrosion in coal-fired boilers, 7:56710 (GAT-S—24/Rev.1)
    Direct observations of pulverized coal particles in a combustion environment, 7:56104
    Electric utility use of fireside additives. Final report, 7:56100 (EPRI-CS—1318)
  Combustion Kinetics
    Kinetics of NO/sub x/ formation during early stages of pulverized-coal combustion. Seventh quarterly report, April 1, 1982-June 30, 1982, 7:56095 (DOE/PC/30295—7)
  Combustion Products
    Environmental factors influencing the use of coal as a marine boiler fuel. Final report 8 May 1981-15 February 1982, 7:56050 (PB—82-171455)
    Naturally occurring high chloride coal and superheater corrosion - a laboratory study, 7:56103
  Combustion Properties
    Combustion and agglomeration of coal-oil mixtures in furnace environments, 7:56106
  Devolatilization
    Investigation of coal devolatilization: kinetics and product characterization. Second quarterly report, 23 May 1981-23 August 1981, 7:56026 (DOE/MC/16221—T4)
  Drying
    Effects of drying and oxidation on coal pore structure, 7:56083
  Electron Spin Resonance
    Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
  Fluidized-Bed Combustion
    Fluidized-bed boilers for industrial sized power house, 7:57841
  Fuel Additives
    Corrosion in coal-fired boilers, 7:56710 (GAT-S—24/Rev.1)
  Fuel Supplies
    Coal as an industrial fuel (Netherlands forecasting to 2000), 7:56108 (ESC—9)
  Imports
    Future for US coal exports to southeast Asia: our plans for coal, 7:56091
  Infrared Spectra
    Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
    Investigation of coal devolatilization: kinetics and product characterization. Second quarterly report, 23 May 1981-23 August 1981, 7:56026 (DOE/MC/16221—T4)
  Maritime Transport
    Great Lakes/St. Lawrence Seaway regional transportation study; Great Lakes area industries. Final report, 7:56080 (AD-A—111202/8)
    Rail-to-barge coal transfer facility St. Louis, Missouri. Final environmental impact statement, 7:56079 (AD-A—110061/9)
  Market
    Future for US coal exports to southeast Asia: our plans for coal, 7:56091
  Meetings
    Coal and biomass: the role of synfuels. Conference and workshop summaries, 7:57110 (DOE/ER/10206—1)
    Coal production and transportation: sixth annual conference, 1980, 7:56084
  Molecular Structure
    Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
  NMR Spectra
    Cross-polarization magic angle spinning /sup 13/C NMR spectra of coals of varying rank, 7:56030
  Nuclear Magnetic Resonance
    Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
  Nuclear Reaction Analysis
    Fluorine in some Australian coals using the $^{19}F(p,\alpha\gamma)$ reaction, 7:57545 (INIS-mf—7116)
  Oxidation
    Effects of drying and oxidation on coal pore structure, 7:56083
  Porosity
    Effects of drying and oxidation on coal pore structure, 7:56083
  Production
    As assessment of development and production potential of federal coal leases, 7:56115 (PB—82-149378)
    EPRI's projection of electrical energy: demand and supply (USA; Forecasting to 2000), 7:56078
    Missouri energy profiles 1980, 7:57164 (NP—2903922)
  Pyrolysis
    Effect of rapid heating rate on coal nitrogen and sulfur release. Quarterly technical progress report No. 3, March 19-June 19, 1982, 7:55997 (DOE/PC/40273—T3)
  Rail Transport
    Coal unit-train tariffs: our experience and my assessment, 7:56090
    Comparison of railroad coal unloading systems, 7:56086
    Rail-to-barge coal transfer facility St. Louis, Missouri. Final environmental impact statement, 7:56079 (AD-A—110061/9)
  Reserves
    Missouri energy profiles 1980, 7:57164 (NP—2903922)
  Solvent Extraction
    Solvent extraction of coal, 7:56025 (PB—82-183450)
  Sorptive Properties
    Water-quality monitoring at the Hoe Creek test site: review and preliminary conclusions, 7:58162 (UCRL—87650)

Terminal Facilities
Rail-to-barge coal transfer facility St. Louis, Missouri. Final environmental impact statement, 7:56079 (AD-A—110061/9)
Trade
Effect of market structure on international coal trade, 7:56109 (LA-UR—82-2039)
Transport
Coal production and transportation: sixth annual conference, 1980, 7:56084
EPRI's projection of electrical energy: demand and supply (USA; Forecasting to 2000), 7:56078
Our plans for obtaining, transporting and burning coal along the Gulf Coast, 7:56089
COAL CHEMICALS
See COAL EXTRACTS
COAL DEPOSITS
Leasing
As assessment of development and production potential of federal coal leases, 7:56115 (PB—82-149378)
COAL EXTRACTS
Electron Spin Resonance
Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
Infrared Spectra
Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
Nuclear Magnetic Resonance
Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
COAL FINES
Devolatilization
Direct observations of devolatilizing pulverized coal particles in a combustion environment, 7:56019
COAL GAS
Combustion
Low NO/sub x/ heavy fuel combustor concept program. Phase 1A: combustion technology generation coal gas fuels. Final report, 7:56712 (NASA-CR—165614)
COAL GASIFICATION
See also AGGLOMERATING ASH PROCESS
BABCOCK AND WILCOX-DUPONT PROCESS
FLASH HYDROPYROLYSIS PROCESS
IN-SITU GASIFICATION
MOLTEN SALT COAL GASIFICATION PROCESS
TEXACO GASIFICATION PROCESS
WESTINGHOUSE GASIFICATION PROCESS
Economics
Coal's future: a mining company's views, 7:56021
Environmental Impacts
Health and safety implications of alternative energy technologies - 3. Fossil energy, 7:56056
Evaluation
Direct observations of devolatilizing pulverized coal particles in a combustion environment, 7:56019
Health Hazards
Health and safety implications of alternative energy technologies - 3. Fossil energy, 7:56056
Mathematical Models
Computer modeling of mixing and agglomeration in coal-conversion reactors. Volume I. Model formulation. Final report, September 15, 1978-February 28, 1982, 7:55980 (DOE/ET/10329—1211-Vol.1)
Reviews
Coal gasification: why and where do we stand, 7:56023
Technology Assessment
Process catalog for synfuel technologies in Texas, 7:56006 (PB—82-159955)
Water Pollution
Comparison of analytical methods for phenols, cyanide, and sulfate as applied to groundwater samples from underground coal gasification sites, 7:56060
COAL GASIFICATION PLANTS
Design
Conceptual project study for anthracite coal gasification to produce fuels and chemicals, NEPGAS project, 7:56002 (DOE/RA/20221—T1-Vol.1)
Operation of the molten salt coal gasification process development unit, 7:56024
Environmental Effects
Coal to methanol feasibility study: Beluga methanol project. Volume IV. Environmental. Final report, 7:56452 (DOE/RA/50299—1119-Vol.4)
Environmental Impacts
Baseline environmental characterization of Pike County Coal-Gasification Facility site. Environmental Sciences Division publication No. 1858, 7:56044 (ORNL/TM—8035)
Materials Testing
Microstructural study of failure mechanisms during mechanical testing in coal gasification environments. Annual report Mar 80-Feb 81, 7:56010 (PB—82-180647)
Occupational Diseases
Biological exposure sensors in coal-conversion technologies, 7:58268
Permit Applications
Coal to methanol feasibility study: Beluga methanol project. Volume IV. Environmental. Final report, 7:56452 (DOE/RA/50299—1119-Vol.4)
Socio-Economic Factors
Coal to methanol feasibility study: Beluga methanol project. Volume IV. Environmental. Final report, 7:56452 (DOE/RA/50299—1119-Vol.4)
Waste Water
Comparison of bacterial luminescence and fish bioassay results for fossil-fuel process waters and phenolic constituents, 7:56058
Identification of components in aqueous effluents associated with new coal technologies and geothermal energy sources, 7:56059
Water Requirements
Low BTU coal gasification demonstration project, Georgetown, KY. Water assessment report, 7:56047 (PB—82-161928)
COAL INDUSTRY
Coal and industry in the Netherlands, 7:56111 (PB—82-159500)
Economic Impact
Economic-impact study of the expanding coal-mining industry in Tuscaloosa County, Alabama (Alabama), 7:56110 (NP—2903933)
Forecasting
Outlook for US coal, 7:56107 (DOE/EIA—0333)
Investment
Report of the Association of Mining Engineers and Technicians on actual state and development trends in mining in Poland, 7:57113
Recommendations
Report of the Association of Mining Engineers and Technicians on actual state and development trends in mining in Poland, 7:57113
Social Impact
Economic-impact study of the expanding coal-mining industry in Tuscaloosa County, Alabama (Alabama), 7:56110 (NP—2903933)
COAL LIQUEFACTION
See also EXXON LIQUEFACTION PROCESS
FLASH HYDROPYROLYSIS PROCESS
H-COAL PROCESS
SRC-II PROCESS
TSL PROCESS
Coal conversion and the department of energy, 7:57116
Process for preparing a liquid fuel composition (Patent), 7:56016
Chemistry
Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit (111 references), 7:56001 (DOE/PETC/TR—82/13)
Economics
Coal's future: a mining company's views, 7:56021
Environmental Impacts
Health and safety implications of alternative energy technologies - 3. Fossil energy, 7:56056
Fuel Slurries
Rheological characterization of coal liquefaction preheater slurries, 7:56018

Health Hazards
Health and safety implications of alternative energy technologies - 3. Fossil energy, 7:56056
Technology Assessment
Process catalog for synfuel technologies in Texas, 7:56006 (PB—82-159955)
COAL LIQUEFACTION PLANTS
Occupational Diseases
Biological exposure sensors in coal-conversion technologies, 7:58268
Water Requirements
Synthetic fuels development in the Upper Colorado Region: section 13(a) water assessment report. Technical report, 7:56005 (PB—82-156761)
COAL LIQUIDS
Boiling Points
SRC-I Demonstration Plant analytical laboratory, 7:56027 (DOE/OR/03054—6)
Carcinogenesis
Biological exposure sensors in coal-conversion technologies, 7:58268
Chemical Analysis
Characterizing SRC-I products, 7:55995 (DOE/OR/03054—6)
Development of SRC-I product analysis, 7:55994 (DOE/OR/03054—6)
Heteroatom speciation in coal liquefaction via FT-IR coupled with liquid chromatography. Quarterly progress report, October 1, 1981-December 31, 1981, 7:55998 (DOE/PC/40799—T1)
Recycle slurry-oil characterization. First annual report, October 1, 1980-September 30, 1981, 7:55996 (DOE/PC/30027—24)
Chemical Composition
Flash hydropyrolysis of coal for conversion to liquid and gaseous fuels, 7:55985 (DOE/METC—82-48)
Combustion
Coal derived (SRC II) fuel in a medium speed diesel engine: an investigation, 7:57284
Design and preliminary results of a fuel flexible industrial gas turbine combustor, 7:56101
Low No/sub x/ combustion systems for burning heavy residual fuels and high-fuel-bound nitrogen fuels, 7:56102
Synthetic-fuel aromaticity and staged combustion. Seventh quarterly technical progress report, April 1, 1982-June 30, 1982, 7:56097 (DOE/PC/30302—7)
Combustion Products
Low NO/sub x/ and fuel flexible gas turbine combustors, 7:56180
Small scale combustion tests of solvent refined coal (SRC-II) liquids, 7:56105
Deashing
LC-Finer product analysis, 7:55993 (DOE/OR/03054—6)
Denitrification
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Eighth quarterly report, June 15, 1980-September 15, 1980, 7:55981 (DOE/ET/11429—8)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Ninth quarterly report, September 15, 1980-December 15, 1980, 7:55982 (DOE/ET/11429—9)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Eleventh quarterly report, March 15, 1981-September 15, 1981, 7:55983 (DOE/ET/11429—11)
Density
SRC-I Demonstration Plant analytical laboratory, 7:56027 (DOE/OR/03054—6)
Electron Spin Resonance
Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
Fractionation
Heteroatom speciation in coal liquefaction via FT-IR coupled with liquid chromatography. Quarterly progress report, January 1, 1982-March 31, 1982, 7:55999 (DOE/PC/40799—T2)
Heteroatom speciation in coal liquefaction via FT-IR coupled with liquid chromatography. Quarterly progress report, October 1, 1981-December 31, 1981, 7:55998 (DOE/PC/40799—T1)
Recycle slurry-oil characterization. First annual report, October 1, 1980-September 30, 1981, 7:55996 (DOE/PC/30027—24)
Gas Chromatography
SRC-I Demonstration Plant analytical laboratory, 7:56027 (DOE/OR/03054—6)
Hydrogenation
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Eighth quarterly report, June 15, 1980-September 15, 1980, 7:55981 (DOE/ET/11429—8)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Ninth quarterly report, September 15, 1980-December 15, 1980, 7:55982 (DOE/ET/11429—9)
Development of unique catalysts for hydrodenitrogenation of coal-derived liquids. Eleventh quarterly report, March 15, 1981-September 15, 1981, 7:55983 (DOE/ET/11429—11)
LC-Finer product analysis, 7:55993 (DOE/OR/03054—6)
Operation of the Wilsonville solvent-refined coal pilot plant: startup, calibration, and initial operation of the H-oil ebullated-bed hydrotreater unit. Technical evaluation, 7:55978 (DOE/ET/10154—103)
Process for preparing a liquid fuel composition (Patent), 7:56016
Infrared Spectra
Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
Heteroatom speciation in coal liquefaction via FT-IR coupled with liquid chromatography. Quarterly progress report, January 1, 1982-March 31, 1982, 7:55999 (DOE/PC/40799—T2)
Heteroatom speciation in coal liquefaction via FT-IR coupled with liquid chromatography. Quarterly progress report, October 1, 1981-December 31, 1981, 7:55998 (DOE/PC/40799—T1)
LC-Fining
LC-Finer product analysis, 7:55993 (DOE/OR/03054—6)
Liquid Column Chromatography
Heteroatom speciation in coal liquefaction via FT-IR coupled with liquid chromatography. Quarterly progress report, January 1, 1982-March 31, 1982, 7:55999 (DOE/PC/40799—T2)
Heteroatom speciation in coal liquefaction via FT-IR coupled with liquid chromatography. Quarterly progress report, October 1, 1981-December 31, 1981, 7:55998 (DOE/PC/40799—T1)
Market
Characterizing SRC-I products, 7:55995 (DOE/OR/03054—6)
Mass Spectroscopy
Heteroatom speciation in coal liquefaction via FT-IR coupled with liquid chromatography. Quarterly progress report, October 1, 1981-December 31, 1981, 7:55998 (DOE/PC/40799—T1)
Nuclear Magnetic Resonance
Changes in chemical structure during coal liquefaction in PETC's 400 lb/day liquefaction unit, 7:56001 (DOE/PETC/TR—82/13)
Recycle slurry-oil characterization. First annual report, October 1, 1980-September 30, 1981, 7:55996 (DOE/PC/30027—24)
Refining
Refining of coal-derived synthetic crudes. Technical report, 7:56008 (PB—82-169095)
Solvent Extraction
Recycle slurry-oil characterization. First annual report, October 1, 1980-September 30, 1981, 7:55996 (DOE/PC/30027—24)
Teratogenesis
Embryo culture in teratological surveillance and serum proteins in development. Progress report, 1981-1982, 7:58248 (DOE/EV/03139—46)
Thermal Gravimetric Analysis
Flash hydropyrolysis of coal for conversion to liquid and gaseous fuels, 7:55985 (DOE/METC—82-48)

Yields
Comparison of coal liquefaction yields obtained by solvent separation and distillation, 7:55992 (DOE/OR/03054—6)
COAL MINERS
Biological Stress
Mining health hazard evaluation report 78-101-100, field study of heat stress at a surface coal mine, Man, West Virginia, 7:56114 (PB—82-172933)
Training
Development and fabrication of a dragline training system. Final technical report, February 1982, 7:56063 (DOE/ET/10022—1)
COAL MINES
Acid Mine Drainage
Delineation of acid mine drainage potential of coal-bearing strata of the Pottsville and Allegheny Groups in western Pennsylvania. Technical completion report, 7:56045 (PB—82-157876)
Alarm Systems
Health safe alarm evaluation. Final report (Combustible gas/oxygen deficiency), 7:56112 (AD-A—111449/5)
Dusts
Foam suppression of respirable coal dust. Final report, 7:56113 (PB—82-166505)
Electric Power
Interactive mine-power-system analysis: Volume I. Open file report, 28 September 1979-30 November 1980, 7:56069 (PB—82-138298)
Interactive mine-power-system analysis. User's manual: Volume II. Open file report, 28 September 1979-28 January 1980, 7:56070 (PB—82-138306)
Land Reclamation
Revegetation of Alaskan coal mine spoils. Progress report for research, 7:56043 (DOE/EV/10256—2)
Working Conditions
Mining health hazard evaluation report 78-101-100, field study of heat stress at a surface coal mine, Man, West Virginia, 7:56114 (PB—82-172933)
COAL MINING
See also *ACID MINE DRAINAGE*
LONGWALL MINING
SURFACE MINING
UNDERGROUND MINING
Dusts
Field survey of float dust in coal mining operations. Research report Mar 80-Mar 81, 7:56076 (PB—82-172719)
Environmental Effects
Engineering property changes and environmental effects on coal mine wastes due to slaking. Open-file report 26 Sep 1978-15 May 1981, 7:56048 (PB—82-163965)
Spoil Banks
Engineering property changes and environmental effects on coal mine wastes due to slaking. Open-file report 26 Sep 1978-15 May 1981, 7:56048 (PB—82-163965)
Surface Mining
Determining the research needs of the surface-coal-mining industry. Final report, 7:56066 (DOE/FE/00094—T1)
Waste Disposal
Disposal of excess spoil from coal mining and the Surface Mining Control and Reclamation Act of 1977: a study of regulatory requirements, engineering practices, and environmental protection objectives. Final report 14 May 80-13 Nov 81, 7:56042 (PB—82-183898)
Water Pollution
Coal mining and ground-water resources in the United States. Final report, 7:56052 (PB—82-182056)
Water Supply
Coal mining and ground-water resources in the United States. Final report, 7:56052 (PB—82-182056)
COAL PREPARATION PLANTS
Air Pollution Control
A review of standards of performance for new stationary sources - coal preparation plants, 7:56082 (PB—82-152851)
Dusts
A review of standards of performance for new stationary sources - coal preparation plants, 7:56082 (PB—82-152851)
Water Requirements
Banklick Corporation coal-liquid project, Jacksonville, Florida; Caguas municipal solid waste gasification project, Caguas, Puerto Rico; Levy Reclaform Company coke-briquets project, River Rouge, Michigan: section 13(C) water assessment report, 7:56040 (PB—82-157413)
COAL SEAMS
Degassing
Development of technology for coalbed methane recovery program planning. Technical report (final) Sep 80-Jul 81, 7:56184 (PB—82-168436)
Development of technology for coalbed methane recovery program planning: appendix A. technology options. Final report, 7:56185 (PB—82-169699)
Directional Drilling
Drilling right angle drainage holes in coal utilizing water jets, 7:56017
Permeability
Applications of reservoir simulation to in situ coal gasification, 7:56020
COAL TAR
Chemical Analysis
Coal tar pitch sampling analysis. Final report, 7:58250 (PB—82-151309)
Yields
Investigation of coal devolatilization: kinetics and product characterization. Second quarterly report, 23 May 1981-23 August 1981, 7:56026 (DOE/MC/16221—T4)
COAL-DERIVED LIQUIDS
See COAL LIQUIDS
COAL-FIRED MHD GENERATORS
See also *MHD GENERATOR UTSI*
New liquid-metal MHD concepts for solar and coal, 7:57157
Air Pollution Abatement
Effect of secondary combustion on nitric oxide concentrations in a MHD combustion gas, 7:57154
COASTAL REGIONS
Ecology
An introduction to the environmental literature of the Mississippi Deltaic Plain Region, 7:56165 (PB—82-161621)
Energy Conservation
Coastal energy-conservation policy guidelines, 7:57185 (NP—2906167)
COASTAL WATERS
Baseline Ecology
Ecology and distribution of the benthic community on the monterey breakwater, monterey, california, 7:58144 (AD-A—102047)
Geochemistry
Chemical and geochemical studies off the coast of Washington. Progress report, September 1981-July 1982, 7:58152 (RLO—2225-T24-49)
COATINGS
See also *PROTECTIVE COATINGS*
Materials Testing
Coating crystalline nuclear waste forms to improve inertness, 7:56297 (CONF-810528—16)
Removal
Method for fracturing silicon-carbide coatings on nuclear-fuel particles (Patent), 7:56774
COAXIAL CABLES
Electrical Insulation
Laser stripping of coal cables, 7:57756 (BDX—613-2806)
COBALT
Absorption Spectroscopy
Complete testing of the NIOSH method for the determination of trace metals by atomic absorption spectrophotometry, 7:58084 (PB—82-167743)
Alpha Reactions
Integral excitation functions for proton and alpha induced reactions on target elements 22 <= Z <= 28, 7:58643 (INIS-mf—7112)
Crystal Structure
Polarized neutron scattering studies on amorphous solids, 7:57326 (INIS-mf—7059-Vol.1)

Magnetic Properties
Polarized neutron scattering studies on amorphous solids, 7:57326 (INIS-mf—7059-Vol.1)
Photoemission
Measurement of spin polarization of electrons in their photoemission from nickel and cobalt single crystals with photon energies in the area of photothreshold, 7:58352 (JUEL—1697)
Proton Reactions
Integral excitation functions for proton and alpha induced reactions on target elements 22 <= Z <= 28, 7:58643 (INIS-mf—7112)
COBALT 57
K Capture
Electron structure and lifetime of unstable species of nuclear transformations in the solid, 7:57685 (INIS-mf—7117)
COBALT ALLOYS
See also COBALT BASE ALLOYS
Corrosion
Studies of the low temperature hot corrosion of uncoated superalloys, 7:57307 (AD-A—110992/5)
Crack Propagation
Subcritical crack growth in WC-Co alloys, 7:57446 (INIS-mf—7095)
Crystallization
Crystallization of amorphous Cosub(70.3)Fesub(4.7)$Si_{15}B_{10}$; Moessbauer spectroscopy and X-ray diffraction, 7:57331 (INIS-mf—7059-Vol.1)
Fatigue
Comparable investigations of wear and mechanical behaviour of (Ti,Mo)C-Ni and WC-Co cemented carbides, 7:57454 (INIS-mf—7097)
Subcritical crack growth in WC-Co alloys, 7:57446 (INIS-mf—7095)
Fracture Properties
Comparable investigations of wear and mechanical behaviour of (Ti,Mo)C-Ni and WC-Co cemented carbides, 7:57454 (INIS-mf—7097)
Influence of structural parameters on the fracture toughness of sintered carbides WC-Co, 7:57445 (INIS-mf—7095)
Magnetic Properties
Magnetic properties of alloys containing mischmetal, cobalt, copper, iron, and magnesium. Report of investigations/1981, 7:57375 (PB—82-158940)
Mechanical Properties
Relation between structural parameters and mechanical properties of heat-treated WC-Co alloys, 7:57452 (INIS-mf—7096)
Microhardness
Investigations of hard metals based on (Mo,W)C mixed crystals, 7:57450 (INIS-mf—7095)
Microstructure
Influence of alloy microstructure on Al_2O_3-peg morphologies in CoCrAl alloys and coatings, 7:57367 (LBL—14668)
Phase Studies
Investigation on formation and decomposition of the γ-phase in the WC-TiC-TaC-NbC-Co type cemented carbides, 7:57447 (INIS-mf—7095)
Investigations of hard metals based on (Mo,W)C mixed crystals, 7:57450 (INIS-mf—7095)
COBALT BASE ALLOYS
Crystal Structure
Study of the free volume in $Fe_5Co_{70}Si_{15}B_{10}$ and $Fe_{40}Ni_{40}P_{14}B_6$ systems by positron annihilation, 7:57327 (INIS-mf—7059-Vol.1)
Crystallization
Moessbauer study of the crystallization of amorphous metals in radio frequency magnetic fields, 7:57329 (INIS-mf—7059-Vol.1)
COBALT BORIDES
Hyperfine Structure
Hyperfine field, concentration and magnetic anisotropy distributions in amorphous CoB, CoP alloys, a NMR study, 7:57482 (INIS-mf—7059-Vol.1)
Polarized neutron diffraction, EXAFS and Moessbauer spectroscopy studies of amorphous Cosub(1-x)Bsub(x) (x=0.185; 0.22; 0.26) alloys, 7:57436 (INIS-mf—7059-Vol.2)
Moessbauer Effect
Polarized neutron diffraction, EXAFS and Moessbauer spectroscopy studies of amorphous Cosub(1-x)Bsub(x) (x=0.185; 0.22; 0.26) alloys, 7:57436 (INIS-mf—7059-Vol.2)
COBALT CHLORIDES
Moessbauer Effect
After-effects of electron capture of ^{57}Co in frozen aqueous solutions of $^{57}CoCl_2$, 7:57713 (INIS-mf—7059-Vol.2)
Neutron Diffraction
Neutron-scattering study of Cs_3CoCl_4: a system of 1D, S = 1/2 XY antiferromagnetic chains with spin frustration, 7:57474 (BNL—31682)
COBALT COMPLEXES
Chemical Reaction Yield
Preparation, structural characterization, and reactivity of $(PEt_3)_2(CO)Rh\text{-}Co(CO)_4$. A quantitative study of the reversible heterolytic cleavage of the polar Rh-Co bond, 7:57682
Chemical Reactions
Preparation, structural characterization, and reactivity of $(PEt_3)_2(CO)Rh\text{-}Co(CO)_4$. A quantitative study of the reversible heterolytic cleavage of the polar Rh-Co bond, 7:57682
Radiochemistry
Electron structure and lifetime of unstable species of nuclear transformations in the solid, 7:57685 (INIS-mf—7117)
Structural Chemical Analysis
Preparation, structural characterization, and reactivity of $(PEt_3)_2(CO)Rh\text{-}Co(CO)_4$. A quantitative study of the reversible heterolytic cleavage of the polar Rh-Co bond, 7:57682
COBALT COMPOUNDS
Chemical Preparation
Character of the interaction in ternary systems Me-Ga(In)-X (where Me = Mn, Fe, Co, Ni; X = S, Se, Te), 7:57592 (INIS-SU—86)
Syntheses and electronic structures of decamethylmetallocenes, 7:57693
Chemical Reactions
Preparation, structural characterization, and reactivity of $(PEt_3)_2(CO)Rh\text{-}Co(CO)_4$. A quantitative study of the reversible heterolytic cleavage of the polar Rh-Co bond, 7:57682
Electronic Structure
Syntheses and electronic structures of decamethylmetallocenes, 7:57693
COBALT OXIDES
Moessbauer Effect
Magnetic ordering in oxide solid solutions. Final scientific report 1 Sep 79-31 Aug 81, 7:57572 (AD-A—110138/5)
COBALT PHOSPHIDES
Electric Conductivity
Resistivity and channeling studies of ion-implanted NiP and CoP systems, 7:57495 (INIS-mf—7059-Vol.2)
Hyperfine Structure
Hyperfine field, concentration and magnetic anisotropy distributions in amorphous CoB, CoP alloys, a NMR study, 7:57482 (INIS-mf—7059-Vol.1)
Ion Channeling
Resistivity and channeling studies of ion-implanted NiP and CoP systems, 7:57495 (INIS-mf—7059-Vol.2)
Ion Implantation
Resistivity and channeling studies of ion-implanted NiP and CoP systems, 7:57495 (INIS-mf—7059-Vol.2)
COBALT SILICIDES
Interstitials
Further localization studies of Co atoms diffused into silicon, 7:57491 (INIS-mf—7059-Vol.2)
Moessbauer Effect
Further localization studies of Co atoms diffused into silicon, 7:57491 (INIS-mf—7059-Vol.2)
CODONS
Inhibition
Nucleotide modification of tRNA in the yeast Saccharomyces cerevisiae is not affected by the psi factor which modulates suppression efficiency, 7:58208

CO-GENERATION
See COGENERATION
COGENERATION
Meetings
Cogeneration: making it happen, 7:57088 (CONF-820386—Summ.)
Planning
Cogeneration: making it happen, 7:57088 (CONF-820386—Summ.)
Reviews
Cogeneration: making it happen, 7:57088 (CONF-820386—Summ.)
COINCIDENCE SPECTROMETRY
Study of the properties of nuclei far from the beta stability line, 7:58685 (INP—1108/PL)
COKE-OVEN GAS
See COAL GAS
COKING PLANTS
Air Pollution Abatement
Information and data for use in preparation of a criteria document for coke producing operations, 7:56007 (PB—82-166539)
Industrial Medicine
Information and data for use in preparation of a criteria document for coke producing operations, 7:56007 (PB—82-166539)
Working Conditions
Information and data for use in preparation of a criteria document for coke producing operations, 7:56007 (PB—82-166539)
COLD STORAGE
Economic Analysis
Economic analysis of air-conditioning systems with off-peak chilled-water storage. Master's thesis, 7:57169 (AD-A—109876/3)
COLD TRAPS
Cold trap modeling and experiments on NaH precipitation, 7:56870
On-line impurity monitors as applied to a study of cold trapping in liquid lithium, 7:56868
Recent advances in lithium processing technology at the Argonne National Laboratory, 7:56866
Testing of a meshless cold trap for hydrogen removal from sodium, 7:56869
COLLAGEN
Biosynthesis
Ascorbate induction of collagen synthesis as a means for elucidating a mechanism for quantitative control of tissue-specific function, 7:58202
COLLECTIVE ACCELERATORS
Electron Beams
Studies of an unneutral electron cloud in the CFIA, 7:57948
Ion Beams
Collective acceleration of light and heavy ions, 7:57851
Reviews
Recent advances in collective ion accelerators, 7:57849
COLLECTIVE EXCITATIONS
Meetings
Proceedings of the EPS topical conference on large amplitude collective nuclear motions, 7:58586 (INIS-mf—6968)
Proceedings of the EPS topical conference on large amplitude collective nuclear motions, 7:58587 (INIS-mf—7058)
COLLECTIVE MODEL
Yrast States
Collective transitions at high level density, 7:58731
COLLIDING BEAMS
Charge Exchange
Xe/sup +n/-Xe/sup +n/ charge exchange experiment using a split-beam and beam intersection technique, 7:57901
COLLIERIES
See COAL MINES
COLLISIONLESS PLASMA
Magnetic Compression
Magnetic compression, non-adiabatic particle motion and intrinsic stochasticity, 7:58894 (STUDSVIK—81/2)
Stability
Sufficient condition for stability of axisymmetric collisionless systems, 7:58911
COLLOIDS
See also FOAMS
Chemistry
Proceedings of the 3rd conference on colloid chemistry, 7:57589 (INIS-mf—7057)
Meetings
Proceedings of the 3rd conference on colloid chemistry, 7:57589 (INIS-mf—7057)
COLOR MODEL
Unified model of multiple production of hadrons in various processes at high energies, 7:58500 (JINR—R-2-81-729)
COLORADO
Energy Source Development
13(a) assessment of the Rio Grande Region. Final report, 7:58176 (PB—82-159948)
Permit requirements for development of energy and other selected natural resources for the State of Colorado, 7:57104 (USGS-OFR—81-1253)
Water resources reference base for the 13(a) assessment of the Rio Grande Region. Technical memo, 7:58179 (PB—82-161787)
Uranium Deposits
National uranium resource evaluation: Dalhart Quadrangle, Texas, New Mexico, Oklahoma, Colorado, and Kansas, 7:56246 (PGJ/F—081-82)
Water Resources
Water assessment of Cathedral Bluffs shale oil demonstration project, White River basin - Colorado, 7:56218 (PB—82-156738)
Water assessment report on Cathedral Bluffs Shale Oil Demonstration Project, White River Basin - Colorado, 7:56219 (PB—82-159831)
COLORADO RIVER BASIN
Water Resources
Synthetic fuels development in the Upper Colorado Region: section 13(a) water assessment report. Technical report, 7:56005 (PB—82-156761)
COLUMBIA RIVER
Telemetry
System for remote monitoring of changes in aquatic habitat resulting from water-level fluctuations, 7:58173 (PNL-SA—9978)
COLUMBIUM
See NIOBIUM
COMBINED COLLECTORS
Fresnel Lens
Results of testing a development module of the second-generation E-Systems concentrating photovoltaic-thermal module, 7:56521 (SAND—82-0701)
Performance Testing
Results of testing a development module of the second-generation E-Systems concentrating photovoltaic-thermal module, 7:56521 (SAND—82-0701)
COMBINED-CYCLE POWER PLANTS
Coal Gasification Plants
Cool water coal gasification program. First annual progress report. Interim report, 7:56703 (EPRI-AP—2487)
Design
Cool water coal gasification program. First annual progress report. Interim report, 7:56703 (EPRI-AP—2487)
Financing
Cool water coal gasification program. First annual progress report. Interim report, 7:56703 (EPRI-AP—2487)
Gas Turbines
Development of high-temperature turbine subsystem technology to a technology readiness status Phase II. Quarterly report, January-March 1982, 7:56702 (DOE/ET/10340—134)
High-temperature turbine technology program hot-gas path development test. Part II. Testing, 7:56701 (DOE/ET/10340—132)
Operation
Cool water coal gasification program. First annual progress report. Interim report, 7:56703 (EPRI-AP—2487)

Steam Generators
Investigation of combined-cycle steam-plant problems. Final report, 7:56704 (EPRI-AP—2495)
Systems Analysis
Off-design study of an open-cycle MHD power plant with oxygen enrichment, 7:57153
COMBUSTION KINETICS
Mechanisms of droplet combustion, 7:57744 (NASA-CR—168848)
Mathematical Models
Fundamental and semi-global kinetic mechanisms of hydrocarbon combustion. Annual report, 1 July 1981-30 June 1982, 7:56446 (DOE/PC/40283—T1)
COMBUSTION PRODUCTS
Adsorption
Water-quality monitoring at the Hoe Creek test site: review and preliminary conclusions, 7:58162 (UCRL—87650)
Air Pollution Control
Formation and destruction of pollutants in combustion processes: Clearing the air on the role of combustion research, 7:57746
Chemical Analysis
Nitrogen-containing polycyclic aromatic compounds in sooting flames, 7:56057
Corrosive Effects
Naturally occurring high chloride coal and superheater corrosion - a laboratory study, 7:56103
Environmental Impacts
Environmental factors influencing the use of coal as a marine boiler fuel. Final report 8 May 1981-15 February 1982, 7:56050 (PB—82-171455)
COMBUSTORS
See also CATALYTIC COMBUSTORS
CYCLONE COMBUSTORS
Design
Low NO/sub x/ heavy fuel combustor concept program, 7:57839 (DOE/NASA/0148—1)
Low NO/sub x/ heavy fuel combustor concept program. Phase I. Combustion technology generation. Final report, 7:57837 (DOE/NASA/0146—1)
Fuel Substitution
